12. In a poultry-house, a nesting and hatching coop provided with nest-compartments and having a gallery, the top of which is contracted, and longitudinally-slotted doors leading from the gallery to the nest-compartments, and means for locking the said doors, substantially as described.

13. In a poultry-house, a nesting and hatching coop provided with nest-compartments and having a gallery with contracted top, said top being longitudinally slotted, doors leading from the gallery to the nests, gates for the gallery, and means for adjustably holding the gates in position, substantially as described.

14. In a poultry-house, a nesting and hatching coop provided with nest-compartments, doors for said compartments, keeper-bars provided with lugs projecting on opposite sides of the doors, and a locking-bar for the keeper-bars, substantially as described.

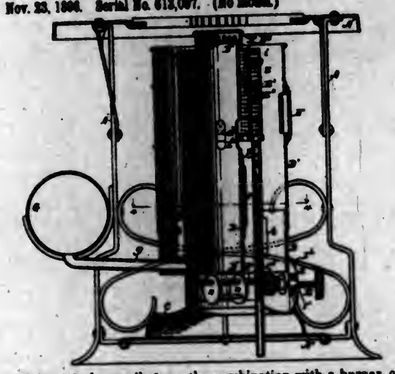
15. The combination with a poultry-house, of a trap having hinged gates adjacent to the house, and runways leading to the house, said runways being in sections, one of which is secured to the hinged gates of the trap, substantially as described.

608,122. WEIGHING AND MEASURING DEVICE. SHANKER A. BIJUR, Bombay, India. Filed Apr. 24, 1897. Serial No. 633,583. (No model.)

Claim.—1. In a measuring device, the combination with a series of radially-disposed rotatable receptacles, of an elastic bottom for each receptacle adapted to rise therein by its resilience, and means to simultaneously adjust said elastic bottoms for graduating the capacity of the receptacles, as specified.

2. In a measuring device, the combination with a series of radially-disposed rotatable receptacles occupying a vertical plane, of an elastic bottom in each receptacle, a flexible connection extending

from each elastic bottom, and means to simultaneously draw upon the flexible connections to move the elastic bottoms down in the receptacles, and similarly change their capacity, as specified.



3. In a measuring apparatus, the registering and indicating device, comprising a gear-box, a centrally-pivoted spur-gear therein adapted for rotation by a main shaft of the measuring device, a series of indicating-wheels each having spaced radial projections thereon, and a changeable series of projections on the spur-gear, adapted to successively engage with the projections on one of the indicating-wheels, as specified.

4. In a device of the described construction, the combination with a measuring apparatus, comprising mainly a casing, and a series of receptacles radially disposed on a transverse rotatable shaft in the casing, of a registering and indicating device on said casing, comprising a main spur-gear, a pinion on the rotatable shaft meshed with the spur gear, a series of indicating-wheels each having spaced radial projections, and a series of changeable spaced radial pins that are projectable from the spur-gear, to successively engage with the radial projections on one of the indicating-wheels, whereby the indicator is adapted to denote partial or entire rotations of the shaft and the receptacles thereon, as specified.

5. In a measuring device, the combination with a supported cylindrical casing, having a receiving-aperture and a discharging-aperture therein, of a rotatable transverse center shaft, means to rotate said shaft, a series of radially-disposed receptacles held on the shaft, a bowed resilient bottom plate in each receptacle adapted to rise by its resilience in the receptacle, a sleeve on the center shaft, a securing device between said sleeve and the shaft, and a flexible connection between each resilient bottom plate and the sleeve, as specified.

6. In a measuring device, the combination with a supported cylindrical casing, having opposite receiving and discharging apertures therein, of a transverse rotatable center shaft, means to rotate said shaft, a series of radial receptacles held on the shaft within the casing, a bowed resilient bottom plate in each receptacle adapted to rise therein by its resilience, a sleeve on the center shaft rotatably adjustable thereon by means of a set-screw penetrating the outer end of the sleeve, and a flexible connection extending between each bottom plate and the adjustable sleeve, as specified.

608,123. OIL-STOVE. CHARLES H. BOSEK, Jackson, Mich., assignor to the Novelty Manufacturing Company, same place. Filed Nov. 23, 1896. Serial No. 613,097. (No model.)

Claim.—1. In an oil-stove, the combination with a burner, of a mixing-chamber arranged over said burner, and an inner draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with passages for supplying air to said air-chamber, said draft-tube having its inlet and outlet ends partially closed so as to limit the supply of air for supporting combustion, substantially as described.

2. In an oil-stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner, a draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with passages whereby communication is established between the draft tube and the mixing-chamber; the upper end of said draft-tube being provided with means for directing air outwardly into the flame issuing from the mixing-chamber; said draft-tube having its inlet end partially closed so as to limit the supply of air for supporting combustion, substantially as described.

3. In an oil-stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner, an inner draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with passages whereby communication is established between the draft-tube and the mixing-chamber, and a removable cap fitting over the end of said draft-tube and provided with passages for directing air outwardly into the flame issuing from the mixing-chamber; said draft-tube having its inlet and outlet ends partially closed so as to limit the supply of air for supporting combustion, substantially as described.

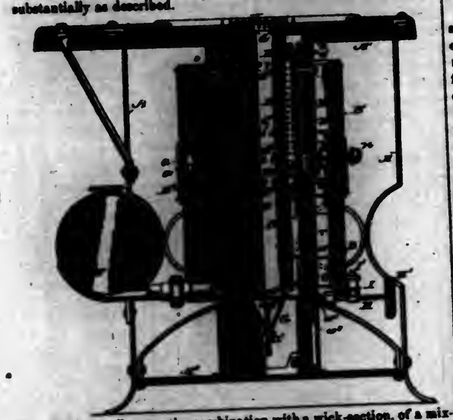
4. In an oil-stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner comprising concentric perforated tubes, a central draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with openings or passages whereby communication is established between the draft-tube and the perforations of the inner tube of said mixing-chamber; the upper end of said draft-tube being provided with means for directing air outwardly over the mixing-chamber; said draft-tube having its inlet and outlet ends provided with flanges or diaphragms extending inwardly to partially close the same and limit the supply of air for supporting combustion, substantially as described.

5. In an oil-stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner, an inner draft-tube separated from the mixing-chamber and the burner by annular chambers and having passages affording communication between its interior and each of said chambers, the said draft-tube being partially closed at its ends, and closures for the ends of the annular chamber between the draft-tube and the mixing-chamber.

6. In an oil stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner comprising concentric perforated tubes, an inner draft-tube separated from the mixing-chamber and the burner by annular chambers, and means for closing the upper and lower ends of the chamber between said draft-tube and the mixing-chamber; said draft-tube being provided with passages connecting said annular chambers with each other and with the draft-tube and having its inlet end partially closed so as to limit the supply of air for supporting combustion, substantially as described.

7. In an oil stove, the combination with a central-draft burner, and a vertically-movable mixing chamber thereabove; of a central draft-tube fixedly connected with said mixing-chamber and depending within the burner and having a partially-closed lower end, said tube constituting a lifting member for the mixing-chamber; and lifting means engaging the partially-closed lower end of the central draft-tube and having a handle on the exterior of the burner.

8. In an oil-stove, the combination with a central-draft burner, and a vertically-movable mixing-chamber thereabove; of a central draft-tube fixedly connected with said mixing-chamber and depending within the burner, a cam device upon which the lower end of said tube rests at two diametrically opposite points each at one side of the air-inlet to the tube, and a rotary spindle carrying said cam device and projecting through the side of the burner and having a knob or handle on the exterior thereof.



9. In an oil-stove the combination with a central-draft burner, and a vertically-movable mixing-chamber thereabove; of a central draft-tube fixedly connected with said mixing-chamber and depending within the burner and having a partially-closed lower end, said tube constituting a lifting member for the mixing-chamber; a pivotal cam or eccentric device engaging the partially-closed lower end of the central draft-tube, and means for turning the cam having a handle on the exterior of the burner.

10. In an oil-stove, the combination with a central-draft burner, of a mixing-chamber arranged over said burner, an inner draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with passages communicating with the air-space so as to supply heated air to said mixing-chamber, and a cap arranged over the upper end of said draft-tube and provided with a suitable passage or passages for directing air into the flame issuing from the mixing-chamber; said draft-tube having its inlet end partially closed so as to limit the supply of air for supporting combustion, substantially as described.

11. In an oil-stove, the combination with a central-draft burner, of a mixing chamber arranged over said burner comprising concentric perforated tubes, a central draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with openings or passages for supplying air to said air-space, and a cap fitting the upper end of said draft-tube and having a suitable passage or passages to direct air into the flame issuing from the mixing-chamber; said draft-tube having its inlet and outlet ends provided with flanges extending inwardly to partially close the same and limit the supply of air for supporting combustion, substantially as described.

608,124. BLUE-FLAME OIL-STOVE. CHARLES H. BOSEK, Jackson, Mich., assignor to the Novelty Manufacturing Company, same place. Original application filed Aug. 10, 1896, Serial No. 602,262. Divided and this application filed Mar. 23, 1898. Serial No. 674,902. (No model.)

Claim.—1. In an oil-stove, the combination with a wick-section, of a mixing-chamber arranged over the same, an inclosed annular air-chamber adjacent to said mixing-chamber and communicating therewith by suitable passages for supplying heated air thereto, and means for supplying fresh air to said inclosed air-heating chamber, substantially as described.

2. In an oil-stove, the combination with a wick-section, of a mixing-chamber arranged over the same, and an internally-arranged draft-tube separated from the mixing-chamber by a suitable air-space and provided with a suitable passage or passages for supplying air to the air-space, substantially as described.

3. In an oil-stove, a central-draft wick-section, an annular mixing-chamber arranged over the same, and a draft-tube arranged centrally within the mixing-chamber and separated therefrom by an annular space or chamber adapted to supply heated air to said mixing-chamber, said draft-tube being provided with suitable openings or passages adjacent to the lower portion of the mixing-chamber for supplying air to the annular air-space, substantially as described.

4. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber suitably supported over the same, and a draft-tube arranged within the mixing-chamber and separated therefrom by a suitable space adapted to supply heated air thereto, said draft-tube being provided with a suitable passage or passages for supplying air from the interior of the burner to said air-space, and with an opening or openings at its upper portion for supplying air to the flame issuing from the mixing-chamber, substantially as described.

5. In an oil-stove, a central-draft wick-section, a mixing-chamber arranged over the same comprising concentric tubes provided with passages for air, and an inner draft-tube separated from the mixing-chamber by an air space or chamber closed at both ends and provided with passages for supplying air to said air space, substantially as described.

6. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber arranged over the same, an inner draft-tube separated from said mixing-chamber by a suitable air-space and provided with passages for supplying air to said space from the interior of the wick-section, and a cap fitting the upper end of the draft-tube and provided with a suitable passage or passages to direct air into the flame issuing from the mixing-chamber, substantially as described.

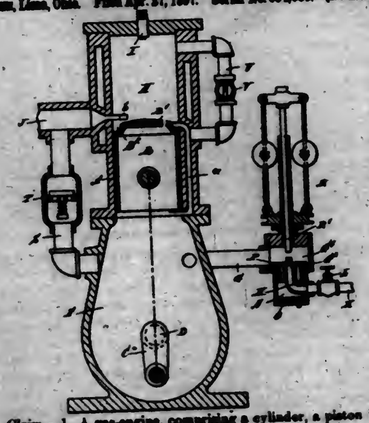
7. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber comprising concentric perforated tubes arranged over said wick-section, a central draft-tube, an annular space or chamber between the inner surface of the inner tube of the mixing-chamber and the draft-tube, and rings connecting said draft-tube to the mixing-chamber so as to close the ends of said air-space, said draft-tube being provided with air-passages for supplying air to the annular space or chamber, substantially as described.

8. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber, comprising concentric perforated tubes arranged over said wick-section, a central draft-tube separated by annular spaces or chambers from the wick-section and the mixing-chamber and provided with passages or openings communicating with said spaces so as to create a circulation within the wick-section and to supply air to the annular space between the mixing-chamber and draft-tube, together with means for causing a draft around the outer surface of the wick-section, whereby cold air may be caused to circulate both around the inner and outer surfaces of said wick-section to keep the latter cool, substantially as described.

9. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber arranged over the same, a central draft-tube and connections therewith for supplying air from the interior of the wick-section to the mixing-chamber, together with an open-ended outer casing for causing a draft or circulation of air around the outer surface of the wick-section to keep the latter cool, substantially as described.

10. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber provided with air passages arranged over said wick-section, and an inner draft-tube separated from the mixing-chamber by an air space or chamber closed at its ends and from the wick-section by a chamber or air-space having its lower end open and its upper end closed, said draft-tube being provided with a passage or passages communicating with the air space or chamber between the mixing-chamber and the draft-tube and with a passage or passages communicating with the upper portion of the chamber or space between said tube and the wick-section, whereby air may be caused to circulate against the inner surface of the wick-section and air supplied to the space between the draft-tube and mixing-chamber, substantially as described.

11. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber comprising concentric tubes arranged over said wick-sections, together with a central draft-tube separated from the mixing-chamber by an air space or chamber and provided with suitable passages for supplying air to said space from the interior of the wick-section, said outer tube of the mixing-chamber being taller than the inner tube and having its upper end flanged or turned inwardly to concentrate the heat, substantially as described.



12. In an oil-stove, the combination with a suitable wick-section, of a mixing-chamber arranged over the same, an inner draft-tube separated from the mixing-chamber by a suitable air space or chamber and provided with passages for supplying air to said space, said draft-tube being attached to the mixing-chamber so as to move vertically therewith, together with means for raising said draft-tube and mixing-chamber to permit the wick to be lighted, substantially as described.

13. In an oil-stove, the combination with a central-draft wick-section, of a mixing-chamber arranged over the same, an outer casing having an opening or openings at the height of the wick-section, and a ring-damper for controlling said opening or openings, substantially as described.

14. In a blue-flame oil-stove, the combination of an annular wick-tube, a vertically-movable commingling-chamber situated thereabove, and a lifting and air-feeding tube extending within the commingling-chamber and forming between the latter and itself an air-heating chamber in communication with the commingling-chamber, said tube communicating with said air-heating chamber and depending within the wick-tube.

15. In a blue-flame oil-stove, the combination of an annular wick-tube, a vertically-movable commingling-chamber situated thereabove, and a lifting and air-feeding tube extending within the commingling-chamber and forming between itself and the latter an air-heating chamber in communication with the commingling-chamber, said tube communicating with said air-heating chamber and feeding air to the principal flame of the burner, substantially as described.

608,125. GAS-ENGINE. JOHN CARNES and CHARLES W. MCKINNEY, Lima, Ohio. Filed Apr. 27, 1897. Serial No. 634,093. (No model.)

Claim.—1. A gas-engine, comprising a cylinder, a piston in the cylinder, a working chamber at one end of the cylinder and provided with an igniting device at its end and with an exhaust-port, a com-

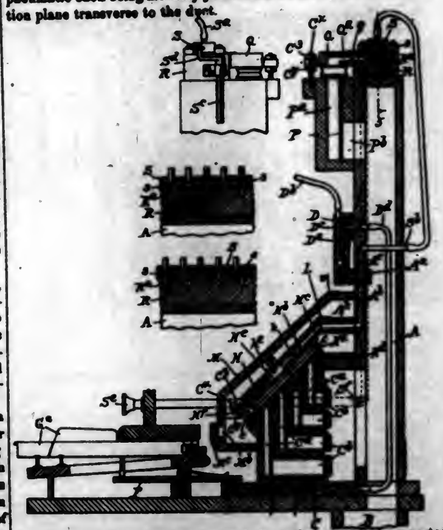
pressing-chamber at the other end of the cylinder, and connected with the working chamber by the port *a* in the wall of the cylinder, the lower end of the port entering the compressing-chamber below the end of the piston when the said piston is in its lowermost position, an air and gas mixing chamber connected with the compressing-chamber, and provided with a valve-seat, an upwardly-opening valve on the seat, an air-pipe connected with the valve-seat and provided with a register at its end, a gas-pipe projecting into the air-pipe through the side thereof and extending to the valve-seat, and a governor above the air and gas chamber and having its stem projecting down into the same, substantially as herein shown and described.

2. A gas-engine comprising a cylinder, a piston operating therein, a working chamber at one end of the cylinder, and a compressing-chamber at the other end thereof and connected with the supply and with its working chamber by a port, so that when the piston moves in one direction, the explosive mixture in the compressing-chamber is compressed, and when the piston nears the end of its working stroke the two chambers are connected with each other through said port to supply the working chamber with the explosive mixture from the compressing-chamber, and an equalizing-valve between the said chambers, substantially as shown and described.

3. A gas-engine comprising a cylinder, a piston operating therein, a working chamber at one end of the cylinder, a compressing-chamber at the other end thereof and connected with the supply, the chambers being connected with each other by a port adapted to be opened and closed by the said piston, a relief-valve for the compressing-chamber, and an equalizing-valve for the working chamber and in communication with the said port, substantially as shown and described.

4. In a gas-engine, the combination with a cylinder having a working chamber at one end and a compressing-chamber at the other end, the working chamber being connected with the compressing chamber by a port in the wall of the cylinder and provided with an exhaust-pipe, a piston in the cylinder, and means for admitting an explosive mixture to the compressing-chamber, of a pipe leading from the upper part of the compressing-chamber into the exhaust-pipe of the working chamber, and a spring-pressed relief-valve in said pipe, substantially as described.

608,126. TRUSS. EDWARD H. G. CLARK, Washington, D. C. Filed Oct. 1, 1897. Serial No. 653,706. (No model.)



Claim.—As an improved article of manufacture a truss made up of textile fabric comprising tubular belt-sections A B, said sections carrying pads *a a*, the central portion of the belt-section B having centrally a filling-piece, tabs *b* secured to the belt-section A adjacent to the pads thereof, said tabs carrying below the belt buckles, straps C C having their ends secured adjacent to each other to the front portion of the belt B, a loop or pocket formed of a strip which is secured to the ends of the straps C C, and to the front portion of the belt, a filling positioned in said pocket and buckles secured to the strap B, substantially as shown and for the purpose set forth.

608,127. PNEUMATIC-ORGAN. MELVILLE CLARK, Chicago, Ill. Filed Dec. 30, 1897. Serial No. 663,561. (No model.)

Claim.—1. In a reed-organ in combination with the reed-chambers, motor-pneumatics or bellows whose moving sides constitute the valves for the reed-chambers, respectively, each bellows each having the back adapted to be fixed with respect to the seat of such valve (formed by the moving wall of the bellows) and releasable and movable at will away from the valve-seat to afford unobstructed access to the reeds and permit their removal.

2. In a reed-organ, in combination with the wind-chest, the reed-blocks mounted thereon having a plurality of reed-chambers corresponding to each note, all opening at a common face or valve-seat; a motor-pneumatic or bellows whose moving side constitutes the valve adapted to seat on such face to control all such reed-chambers; a primary pneumatic which controls such motor-pneumatic; the air-duct leading into such motor-pneumatic being formed in the back of the same and in a fixed portion of the wall of the wind-chest, said pneumatic-back being movably joined to such fixed portion at a junction plane transverse to the duct.

3. In combination with a wind-chest, the reed-block mounted thereon having a plurality of reed-chambers opening upward through an outer face of the reed-block; motor-pneumatics having their backs adapted to be fixed with respect to the faces of the reed-blocks and releasable and movable at will and their moving walls adapted to serve as valves to seat on said face; air-ducts leading to the motor-pneumatics respectively, having two mouths opening respectively into the wind-chest and to the outer air; primary pneumatics mounted outside the wind-chest carrying valves which control both said mouths; said primary pneumatics having suitable communication with the wind-chest, and suitable means for venting the same, substantially as set forth.

4. In a reed-organ, in combination with a wind-chest, a reed-block mounted exteriorly thereto having a plurality of reed-chambers opening upward through an outer face of such reed-block; a motor-pneumatic or bellows having its back fixed with respect to said face and releasable and movable at will and its moving wall adapted to advance and retreat bodily with respect to the face and to seat thereon to operate as a valve to close the mouths of the reed-chambers; a duct leading through such fixed back and communicating with the outer air and with the wind-chest, and a primary pneumatic to control both such communications.

5. In combination with the wind-chest, a reed-block mounted exteriorly thereto having a plurality of reed-chambers opening upward through an exterior face of such block; a motor-pneumatic having its back hinged to the wind-chest and adapted to swing toward said face of the reed-block and to be stopped relatively thereto, and having its moving wall adapted to seat on such face and operate as a valve over the mouths of the reed-chambers; an air-duct leading into such pneumatic through the back thereof from the hinged edge, and communicating at such hinged edge with a duct formed in the wall of the wind-chest, each duct leading to mouths which open respectively to the outer air and into the wind-chest, and a primary pneumatic carrying valves which control both said mouths.

6. In a reed-organ, in combination with the reed chambers, motor-pneumatics having bellows whose moving sides constitute the valves for the reed-chambers respectively, each bellows having the back adapted to be fixed with respect to such seat, and adjusting devices by which the back is secured and adjusted with respect to the seat to cause the moving wall to seat accurately thereon.

7. In combination with the wind-chest and the reed-blocks mounted exteriorly thereon having a plurality of reed-cells in each block opening through an outer face thereof; a motor-pneumatic having its moving wall adapted to serve as a valve, seating on such face, the back or fixed wall of such motor-pneumatic being hinged at one edge, and a threaded stud O adapted to engage the opposite edge of the back, and nuts on said bolt between which said edges engage, whereby said back may be adjustably secured at said edge.

8. In combination with a wind-chest, the primary pneumatics exterior thereto provided with suitable communication therewith and with the outer air, and means for venting the latter; the wall of the wind-chest having an aperture and the primary pneumatic carrying valves which seat at the opposite ends of said aperture respectively; sub-beam-reeds and the pneumatic-valves which control the same; ducts from said pneumatic-valves, and a slide-valve which is adapted to cover all the mouths of such ducts, said slide-valves having ports adapted to register with all said mouths, and flexible pipe connection from such ports leading to the primary-pneumatic-valve seats, and suitable means for moving the slide-valve to cause it to close or bring its ports into registration with the mouths of the pneumatic-valve ducts.

608,128. HACK-SAW. GEORGE H. CLEMENS, Middletown, N. Y. Filed Mar. 29, 1897. Serial No. 629,573. (No model.)

Claim.—1. A saw having spaced straight teeth and set teeth in the spaces between the straight teeth, said straight teeth being connected directly at like ends partly to set teeth merging tangentially into said straight teeth and projecting to one side of the saw, and partly to set teeth likewise merging tangentially into said straight teeth but projecting to the other side of the saw, the outer ends of the set teeth so connected all facing in a like direction, or toward the same end of the saw, substantially as described.

2. A saw having spaced straight teeth, set teeth arranged in pairs between said straight teeth, the teeth of each pair being set to opposite sides of the saw, and the forward teeth of adjacent pairs being likewise set to opposite sides of the saw, sundry of the set teeth being connected directly to the adjacent straight teeth, the free ends or outer ends of the set teeth so connected all facing in the same direction, or toward the same end of the saw, substantially as described.

3. A saw having spaced teeth all alike in size and shape and set as follows: first tooth set to the right, second tooth unset or straight, third tooth set to the right, fourth tooth set to the left, fifth tooth unset or straight, sixth tooth set to the left and following ones repeated in the same order, substantially as described.

4. A hack-saw having spaced straight teeth and pairs of set teeth, the free or cutting ends of the teeth all pointing in the same direction, and the teeth being alike in shape and size, the pairs of set teeth alternating with the straight teeth and the teeth of each pair of set teeth being set to opposite sides of the saw, the forward teeth of adjacent pairs of set teeth being also set to opposite sides of the saw, and the rear teeth of adjacent pairs of set teeth being also set to opposite sides of the saw, the said rear teeth being connected directly to the adjacent straight teeth, substantially as described.

608,129. TWINE HOLDER AND TAKE-UP. FREDERICK W. CORTZ, Brooklyn, N. Y., assignor of one-half to John H. Raymond, same place. Filed Nov. 11, 1897. Serial No. 658,176. (No model.)

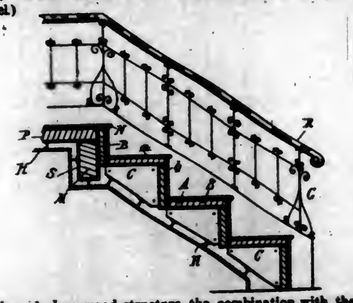
Claim.—1. A twine holder and take up, comprising a pivoted lever having a cord-guide on one end, a stop located above and so as to be engaged by the other end, cord-guides located beyond each end of the lever, a weight adapted to be attached to the cord between the cord-guide on the lever and the adjacent fixed cord-guide, and a stop limiting the drop of said weight, substantially as described.

2. A twine holder and take-up, comprising a pivoted lever having a cord-guide on one end, a stop adapted to be engaged by the other end of the lever when it is swung upward, cord-guides located beyond each end of the lever, weight-guides between the cord-guides on the lever and the adjacent fixed cord-guide, a weight sliding thereon and having a cord-guide, and a stop limiting the fall of said weight, substantially as described.

3. A twine holder and take-up, comprising a pivoted lever having a cord-guide on one end, a stop adapted to be engaged by the other end of the lever when it is swung upward, cord-guides located beyond each end of the lever, said cord-guides being open on their upper sides, a weight and guides therefor between the cord-guide on the lever and the adjacent fixed cord-guide, and a stop limiting the fall of said weight, substantially as described.

4. A twine holder and take-up, comprising a pivoted lever having a cord-guide on one end, a stop adapted to be engaged by the other end of the lever to clamp the cord, fixed cord-guides located beyond each end of the lever, a weight having a pulley mounted thereon, the pivot of said pulley being supported from one end, an arm swinging upon the other end of said pivot and adapted to engage the weight, and a stop limiting the drop of said weight, substantially as described.

5. A twine holder and take-up, comprising a pivoted lever having a cord-guide on one end, a stop adapted to be engaged by the other end to clamp the cord, cord-guides located beyond each end of the lever, said cord-guides being open on their upper sides, weight-guides between the cord-guide on the lever and the adjacent fixed cord-guide, a weight having a pulley mounted thereon, the pivot of said pulley being supported from one end, an arm swinging upon the other end of said pivot and adapted to engage the weight, and a stop limiting the drop of said weight, substantially as described.



6. A twine holder and take-up, comprising a pivoted lever having a cord guide on one end, a stop adapted to be engaged by the other end of the lever to clamp the cord, a weight having a pulley mounted thereon, the pivot of said pulley being hollow and supported from one end, an arm swinging upon the outer end of said pivot, a spiral spring within the pivot, having one end fixed and the other engaging the swinging lever to throw it downward against the weight, a stop on the weight engaged by said arm, and a stop limiting the downward drop of the weight, substantially as described.

7. A twine holder and take-up, comprising a back having a projecting shelf at top and bottom, a lever pivoted to the back just beneath the upper shelf and having a cord-guide on one end thereof, the other end being adapted to engage a stop on the upper shelf, a cord-guide fixed beyond each end of the lever, weight-guides between the end of the lever having the cord-guide and the adjacent fixed cord-guide and connecting the top and bottom shelves, and a weight sliding on said guides and having a cord-guide thereon, substantially as described.

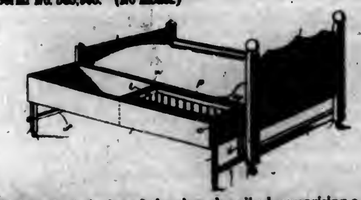
8. A twine holder and take-up, comprising a back having a projecting shelf at top and bottom, a lever pivoted to the back just be-

neath the upper shelf and having a cord-guide on one end thereof, the other end being adapted to engage the cord to clamp it, a cord-guide fixed beyond each end of the lever, wires extending between the upper and lower shelf, and located between the end of the lever having the cord-guide and the adjacent fixed guide and constituting a weight-guide, and a weight having eyes embracing said wires, a pulley mounted thereon by a pivot supported from one end, and a spring-held arm pivoted on the pulley-pivot and adapted to engage the weight or be swung upward, substantially as described.

608,130. **FIRE-RESISTING WOODEN STAIRS.** ALPHONSE DE MAN, Detroit, Mich. Filed Dec. 6, 1895. Serial No. 571,294. (No model.)

Claim.—1. In a wood structure, the combination with the various constituent members, of a non-combustible insulating wrapping for the members the wrapping of each member consisting of fibrous penetrable material entirely surrounding, covering and sealing the same, thereby forming a double course of insulating material at the points of union or contact of the various members, substantially as described.

2. In wooden fire-resisting stairs, the combination of wooden treads, risers and stringers independently insulated with fireproof material, covering all the faces, edges and ends to exclude air for combustion, with veneer or facings on the exposed parts all well secured together forming the body of a stairs.



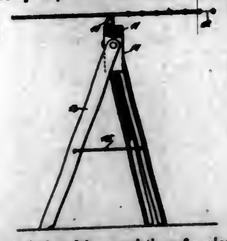
3. In connection with wooden fire-resisting stair-bodies composed of treads, risers and stringers insulated to prevent live combustion and covered on the exposed portions with facing, the metallic bracket-supports secured to the under side of the treads and to the back of the risers in the angle formed by these parts and securing these two parts together substantially and for the purpose set forth.

4. In connection with wooden fire-resisting stair-bodies, the stringers composed of a wooden core insulated with fireproof sheeting to exclude air for combustion, having facings *d d'* and insulated cleats C, so arranged as to leave a space between the cut-out edge of the facings *d d'* and the cleats C these spaces forming the gains J, which are intended to support and form a good connection between the treads and risers and the stringers.

5. In connection with wooden fire-resisting stair-bodies composed of treads, risers and stringers all insulated to prevent live combustion the wooden carriage-piece K and the vertical supporting-blocks both independently insulated with fireproof material to prevent live combustion.

6. The combination of insulated fire-resisting stair-bodies with the wooden newels, composed of a wooden core independently insulated by fireproof material enveloping it on all sides and ends to prevent access of air for combustion, and the exposed parts being faced with finishing material.

608,131. **BED.** JAMES O. DICKINSON, Atlanta, Ga., assignor of one-half to Edward L. C. Ward, Fulton County, Ga. Filed Apr. 2, 1898. Serial No. 505,905. (No model.)

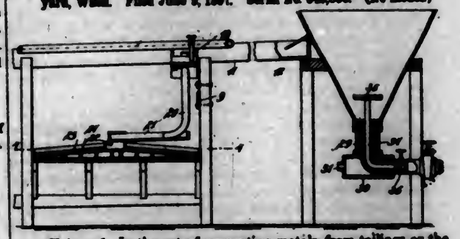


Claim.—1. A device of the class described comprising a major frame, slideways carried thereby, slides adapted to move in said slideways, uprights pivoted intermediate their extremities at the ends of the slides, additional uprights pivoted to the slides, and a supplemental frame carried by the uprights, the first-named uprights being adapted to engage the floor and support the outer ends of the slides.

2. A device of the class described comprising a major frame having slideways, slides adapted to move therein, uprights pivoted to the slides and adapted to project above and below the latter, the lower portion forming supports for the outer ends of the slides, additional uprights pivoted to the slides, and a supplemental frame pivoted to the uprights, the slides being adapted for withdrawal sufficiently to allow the supplemental frame to recline against the major frame.

3. A device of the class described comprising a major frame having slideways, slides adapted to move therein, supports for said slides pivoted thereto and projecting therebelow when in operative position, a supplemental frame pivoted to the supports, bearings in the supplemental frame and a cradle provided with trunnions adapted to work in the said bearings.

608,132. **CLOTHES-DRIER.** CHARLES DRAKE, Mannington, W. Va. Filed Apr. 24, 1897. Serial No. 633,616. (No model.)



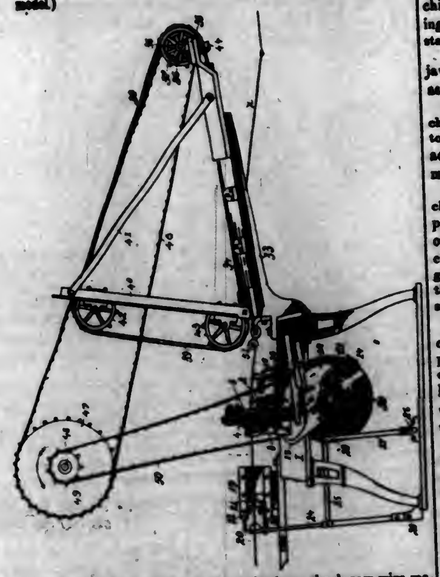
Claim.—1. A clothes-drier, consisting of a wire bent into a helix, the inner end thereof extending to the center and being bent to form an eye, lying in a plane perpendicular to the plane of the helix, then extending perpendicular to the plane of the helix, the extreme end thereof forming a pivot upon which the whole may revolve, substantially as described.

2. A clothes-drier, consisting of a wire bent into a helix, the inner end thereof terminating in a pivot which is perpendicular to the plane of the helix and is connected to the body of the helix by a laterally-extending eye which acts as a shoulder, and a series of radially-extending connectors attached to the coils of the helix and limiting their relative movements, substantially as described.

3. A clothes-drier, consisting of a wire bent into a helix, the inner end thereof extending to the center and being bent to form an eye lying in a plane perpendicular to the plane of the helix and then extending perpendicular to the plane of the helix, the extreme end thereof forming a pivot upon which the whole may revolve, and a folding stand having a socket in its upper end adapted to receive said pivot and to support the helix, substantially as described.

4. A clothes-drier, formed of a single wire bent into coils of successively-increasing size, the coils being joined by radial braces or connectors, and a central supporting-pivot formed upon the inner end of said wire, substantially as described.

608,133. **SEPARATOR FOR METALS.** WILLIAM J. DWYER, Hillyard, Wash. Filed June 9, 1897. Serial No. 640,000. (No model.)



Claim.—1. In the art of separating metals from tailings or the like, a series of tables, a carrier-trough common to all of the tables, a grading-hopper at the feed end of said carrier-trough, a water-pipe extended into the bottom of said hopper said having outlet-perforations, another pipe surrounding the first-named pipe, and a boxing surrounding the last-named pipe and provided with an outlet, substantially as specified.

2. A separator for metals, comprising a series of inclined tables, a distributer at the upper end of each table, a carrier-trough common to all of the tables, a boxing secured to the trough over each table, the said boxing having a partition dividing it into upper and lower chambers, a valve for controlling an opening through the partition, a pipe leading from the lower of said chambers to the distributer, the upper chamber having communication with the trough, a water-pipe extended along the trough, and valve-controlled pipes leading from the water-pipe through the closed upper ends of the lower chambers, substantially as specified.

3. In the art of separating metals from tailings or the like, a series of inclined tables each having a canvas cover, a carrier-trough extended across the series of tables above their upper ends and having communication with the several tables, a hopper at the feed end of said carrier-trough, a pipe extended from the bottom of the hopper and terminating in a horizontally-disposed boxing having an outlet, a water-pipe leading into said boxing and through the pipe extended from the hopper, the said pipe being provided in its vertical portion with perforations, a valve for controlling said water-pipe, a smaller water-pipe in the first-named water-pipe and extended into the lower portion of the hopper, perforated cross-pipes upon the upper end of said water-pipe, and a valve at the lower end of said inner pipe, substantially as specified.

608,134. **MACHINE FOR MAKING CHECK-ROW WIRE.** ROBERT FARIES, Decatur, Ill., assignor to the Furies Manufacturing Company, same place. Filed June 26, 1897. Serial No. 642,606. (No model.)

Claim.—1. A shears for cutting wire in a check-row-wire machine, such shears having a wire-guide on its active jaw, substantially as set forth.

2. In a machine for making check-row wire, a guide-bar adapted to be moved into and out of the path of the incoming wire, whereby the end of such wire may be guided to knotting position, substantially as set forth.

3. In a shears for cutting wire in a check-row-wire machine, an active jaw adapted to cut the wire and push one of the severed ends out of the path of the wire through the machine, substantially as set forth.

4. In a shears for cutting wire in a check-row-wire machine, an active jaw adapted to cut the wire and push one of the severed ends out of the path of the wire through the machine, and a guide-bar on such jaw adapted to be moved into the path of the wire as such severed end is pushed aside, substantially as set forth.

5. In a shears for cutting wire in a check-row-wire machine, the combination of a relatively inactive jaw adapted to be moved to and from its work and an active jaw forming a wire-guide, substantially as set forth.

6. In wire-cutting mechanism for check-row-wire machines, the combination of a passive shears-arm pivoted to swing to and from the path of the wire, an active shears-arm pivoted on the passive arm, and a cam adapted to act first on the passive arm and then on the active arm, whereby the shears may be moved to position and the wire severed by the action of the cam, substantially as set forth.

7. In wire-cutting mechanism for check-row-wire machines, the combination of a passive shears-arm pivoted to swing to and from the path of the wire, an active shears-arm pivoted on the passive arm, a pair of bars each pivoted at one end and provided with a roller at the other end, rods connecting the bars one with each shears-arm, and a cam adapted to act on the rollers successively, substantially as set forth.

8. In mechanism for cutting wire in a check-row-wire machine, the combination of a passive shears-arm pivoted to swing to and from the path of the wire, an active shears-arm pivoted on the passive arm and having a guide-groove on its jaw, a feeder to advance the wire into the machine after the cutting operation is performed, and a cam to move the passive arm to position, to move the active arm to cut the wire, and to hold the arms in the positions they occupy immediately after the wire is cut until the incoming end is fed to coöperate with the outgoing end in the proper relative position, substantially as set forth.

9. Mechanism for feeding wire into a check-row-wire machine consisting of a slide having a fixed jaw and a swinging jaw, a rock-arm, a cam adapted to rock the arm, and a connection between the swinging jaw and the rock-arm whereby the swinging jaw may force the wire against the fixed jaw and the slide may be moved when motion is imparted to the rock-arm, substantially as set forth.

10. Mechanism for withdrawing wire from check-row-wire machines, comprising a primarily acting gripper and a secondarily acting tappet adapted to engage and adjust the knot last made, substantially as set forth.

11. Gripper-jaws for engaging knots of check-row wire, such jaws having lips adapted to extend beneath the wire, substantially as set forth.

12. Mechanism for withdrawing wire from check-row-wire machines, comprising an endless chain, a gripper on the chain adapted to give primary motion to the wire, and a tappet, also on the chain, adapted to engage the knot last formed and complete the withdrawal motion, substantially as set forth.

13. Mechanism for withdrawing wire from check-row-wire machines, consisting of an endless chain, a gripper on the chain composed of a pair of pivoted jaws, guide-walls adapted to force the jaws of the gripper together throughout a portion of the travel of the chain, whereby the wire may be carried by the gripper while the gripper is between the guide-walls, and a tappet adapted to engage the last-formed knot of the wire and complete the discharging action, substantially as set forth.

14. Mechanism for withdrawing wire from check-row-wire machines, consisting of an endless chain, a gripper on the chain composed of a pair of pivoted jaws, guide-walls to hold the gripper-jaws closed throughout a portion of the run of the chain, a tappet swung loosely on the chain and provided with guide extensions, and guideways to engage the tappet extensions at a certain locality in the travel of the chain and hold the tappet rigid, substantially as set forth.

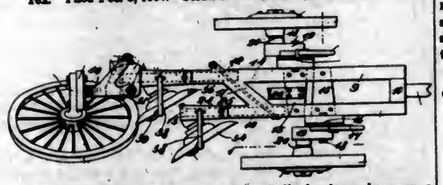
15. In mechanism for withdrawing wire from check-row-wire machines, the combination of an endless chain, a gripper on the chain, a tappet swung loosely on the chain, a guideway to hold the tappet rigid with relation to the chain throughout a portion of its travel, and a trip to throw the tappet when it passes out of the control of the guideway, substantially as set forth.

16. In mechanism for withdrawing wire from check-row-wire machines, the combination of a gripper adapted to move the wire lengthwise, and a push-lever adapted to divert the wire laterally simultaneous with the initial action of the gripper, substantially as set forth.

17. In mechanism for cutting wire in check-row-wire machines and withdrawing it therefrom, the combination of a rotary cam, an endless chain adapted to make a trip in its travel while the cam makes a rotation, wire-cutting shears adapted to be actuated by the cam, and a wire-withdrawing gripper carried by the chain, substantially as set forth.

18. In mechanism for feeding wire into a check-row-wire machine, cutting it therein, and withdrawing it therefrom, the combination of a rotary cam, an endless chain adapted to make a trip in its travel while the cam is making a rotation, wire-cutting shears, a wire-feeder, and a gripper on the chain, the connections being such that the cam moves the shears to operative position, cuts the wire and operates the feeder, in the order named, and subsequently the gripper on the chain engages the wire, substantially as set forth.

608,135. **ELECTRICAL FOOT-GEAR.** José Gallegos, Guatemala, Guatemala. Filed Mar. 6, 1893. Serial No. 672,674. (No model.)



Claim.—1. An electrical generator for foot-gear, having an insulating-insole, and a generating-insole laid on the insulating-insole,

the generating-insole being formed of a fabric composed of woven strands covered with glass beads.

2. As a new article of manufacture, a static electrical generator for frictional contact with the human body, said generator consisting in a closely-formed fabric composed of strands covered with glass beads, the beads lying close to each other and forming the surfaces of the fabric.

608,186. GANG-PLOW. FREDERICK W. GORDON, Valley View, Tex. Filed Feb. 3, 1897. Serial No. 621,850. (No model.)

Claim.—1. The combination of a spindle having a keyway, a member to turn on the spindle and also having a keyway, and a key with two diagonally-disposed parts respectively capable of running in the keyways of the spindle and of the said member whereby to hold the said member in two positions with reference to the spindle, substantially as described.

2. The combination of a spindle, a member turning on the spindle, the spindle and member having keyways, and a key having portions respectively capable of fitting within the keyway of the spindle and of said member whereby to hold the member in two positions relative to the spindle, substantially as described.

3. The combination of a spindle having a keyway, a member capable of turning on the spindle, and also having a keyway, and a spindle with two parts of duplicate cross-sectional form and of angular relation to each other, the said parts of the key respectively running within the keyways, and the key being capable of holding the said member at various positions with reference to the spindle, substantially as described.

4. The combination of a spindle having a square keyway, a member mounted to turn on the spindle and also having a keyway, and a key the cross-sectional form of which is that of two squares with diagonal relation to each other, and the key being capable of having its squares respectively run in the keyways whereby to hold the said member in either of said two positions with reference to the spindle, substantially as described.

5. The combination of a frame, a plow-disk carried by the frame, a wheel forward on the frame, means for varying the position of said wheel with reference to the frame, and a guide-wheel rearward in the frame.

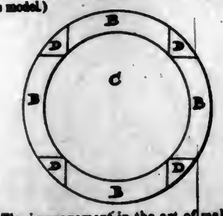
6. The combination of a frame having two rigidly-joined beams, a spindle projecting rearward from each beam, a disk for each spindle and means for holding the disks respectively at the sides of the spindles, the said means being adjustable axially on the spindles, to adjust the disks.

7. The combination of a beam, a spindle projected longitudinally from the beam, a wheel carried by the end of the spindle, and a disk carried at one side of and on the spindle.

8. The combination with a support, of two blocks, one of which is held on the support and the second of which is adjustable on the first, and a bracket one portion of which is pivotally mounted on the first block and a second portion of which is pivotally connected to the second block.

9. The combination of a frame formed of two longitudinal beams, means rigidly connecting the beams, a spindle projecting from the rear of each beam, a sleeve rockably mounted on each spindle at points rearward of the beams, cultivating-tools carried by the sleeves, and means for supporting the frame.

10. The combination of a frame, a spindle projecting from the rear of the frame, a sleeve rockably mounted on the spindle at a point rearward of the frame, a cultivating-tool carried by the sleeve, means for supporting the forward portion of the frame, a guide-wheel rearward of the frame, and means for mounting the guide-wheel on the spindle at a point rearward of the sleeve.



608,187. DEVICE FOR DECORATING TILES OR PLANE SURFACES. GEORGE H. GRIMBLY, Derby, and GEORGE A. LINGARD, Old Normanton, England. Filed Nov. 24, 1896. Serial No. 613,213. (No model.)

Claim.—1. The combination with a photocollotype printing-film for direct photocollotype printing on tiles or other plane hard surfaces, of an elastic support composed of two layers of vulcanized india-rubber of different qualities cemented together, one of which is a thin upper layer of dense non-elastic rubber and upon which the photocollotype-film is spread and the other being a thicker substratum of elastic rubber, and a smooth-surfaced rigid backing-plate for said elastic support, substantially as specified.

2. The combination with a photocollotype printing-film for direct photocollotype printing on tiles or other plane hard surfaces, of an elastic support upon which the photocollotype-film is spread, and a smooth-surfaced backing-plate, the elastic support being composed of two layers of vulcanized india-rubber of different qualities cemented together, namely, a thin upper layer upon which the film is spread and formed of dense non-elastic rubber, and a thicker substratum of elastic rubber cemented to the backing-plate, substantially as specified.

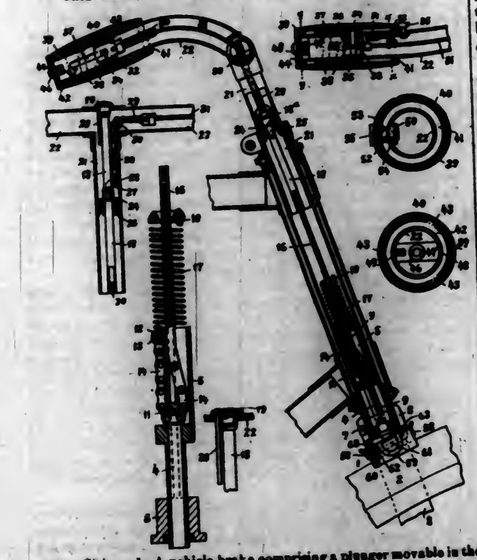
608,188. BUILDING CIRCULAR WOODEN STRUCTURES. RICHARD R. GUBBINS, London, England. Filed Nov. 13, 1896. Serial No. 612,004. (No model.)

Claim.—1. The improvement in the art of making wooden pulleys, rims or similar rings which consists in cutting the longitudinal edges of pieces of boards to constitute a composite cross-grained board, planing parallel the cross-grained edges of the said board and sizing the same and dividing the said board into segments each segment bounded longitudinally by concentric arcs and at the ends by the planed edges of the board and gluing the segments with interposed pieces together to form said rims.

2. The ring composed of circular segments, B, having parallel ends, planed and sized, set so that the adjacent ends of each pair of segments are at right angles to one another, combined with the corner-pieces glued in, filling the spaces, D, between the said ends of the said segments, B, for the purpose set forth.

608,189. ROAD-MAKING MACHINE. CHARLES R. HACKER, Brunswick, Me. Filed Aug. 23, 1897. Serial No. 649,196. (No model.)

Claim.—1. A road-making machine comprising a vehicle-body, a transversely-extending knife-blade carried by a frame fitted to slide vertically in suitable bearings, the said knife-blade being adapted to move below the said body to cut the bushes, weeds and other growth in the path of the vehicle-body, and a triangular scraper on the rear end of the vehicle-body for leveling the ground, the rear end of the scraper being provided with angular flanges, substantially as shown and described.



2. A road-making machine comprising a vehicle-body having runners connected with each other, cutters carried by the said runners, and a triangular scraper supported by the said body between the rear ends of the said runners, the lower ends of the scraper as well as the cutters extending below the body and edges of the runners, substantially as shown and described.

3. A road-making machine comprising a vehicle-body having runners connected with each other, cutters carried by the said runners, and a triangular scraper supported by the said body between the rear ends of the said runners, the lower ends of the scraper as well as the cutters extending below the body and edges of the runners, the said cutters and the apex of the scraper being in longitudinal alinement with each other, as set forth.

4. A road-making machine comprising a vehicle-body having runners connected with each other, cutters carried by the said runners, a triangular scraper supported by the said body between the rear ends of the said runners, the lower ends of the scraper as well as the cutters extending below the body and edges of the runners, and a grubbing-knife held vertically adjustable on the said runners, substantially as shown and described.

5. A road-making machine, comprising a vehicle-body having runners connected with each other, a transversely-extending grubbing-knife carried by a frame vertically adjustable in bearings at the inner side of the said runners, a triangular scraper supported by the said body and having its forward end extending between the rear ends of the said runners, the rear end of the said scraper being provided with angular flanges, and circular cutters carried by the said runners at the front and rear of the grubbing-knife, substantially as shown and described.

608,140. BICYCLE-BRAKE. EDWARD S. HALL, New York, N. Y. Filed Jan. 28, 1897. Serial No. 621,067. (No model.)

Claim.—1. A vehicle-brake comprising a plunger movable in the steering-wheel-fork stem, a brake device held to the plunger, a relatively-fixed plug or part at the fork, a support held to said plug, a pin held to the support and not entering the fork-stem, a flexible draft connection held at one end to the plunger and passing in a bight under said pin, a pulling connection at the other end of said draft connection, and means operating said pulling connection.

2. A vehicle-brake comprising a plunger movable in the steering-wheel-fork stem, a brake device held to the plunger, a relatively-fixed plug or part at the fork, a support held to said plug, a pin held to the support and not entering the fork-stem, a flexible draft connection held at one end to the plunger and passing in a bight under said pin, a pulling connection at the other end of said draft connection, means operating said pulling connection, and a retracting-spring held at opposite ends to the pin-support and plunger.

3. A vehicle-brake comprising a plunger 4 5 movable in the steering-wheel-fork stem, a brake device held to the plunger, a plug 6 fixed at the fork-crown, rods 9 held to plug 6, a cap 10 and pin 11 held to the rods, a flexible connection 14 held at one end to the plunger and passing in a bight under pin 11, a spring 17 held to parts 5, 10, a pulling connection attached to part 14, and means operating said pulling connection.

4. The combination, with the handle-bar, a brake-operating device thereon, a brake, means within the steering-wheel-fork stem operating the brake, and the two-part intermediate coupling having a shoulder and permitting vertical adjustment of the handle-bar, of a support 24, 25, on which the shoulder of the coupling rests, a laterally-curved yoke connected to the support, and a flexible draft device connecting said yoke with the brake-operating devices, substantially as described.

5. The combination, with the slotted handle-bar and draft devices in said bar actuating the brake, of an operating-handle surrounding the bar and having interior end rings bearing thereon, and also having an interior lining and a worm-screw plate within the lining; said lining and screw-plate both having larger diameter than the handle-bar and having no bearing thereon; and a slide and pin within the handle-bar connecting the worm with the draft devices of the brake.

6. The combination, with the handle-bar, of an operating-handle turning thereon and having an interior lining 39 and an end-ring bearing 42 provided with lugs 43 entering slots of the lining; an end plate 44 fitted within the lining and upon which the end parts of the lining are pressed down, and a headed screw 45 entering a stud 46 projecting from the handle-bar through an opening of plate 44, substantially as described.

7. The handle-bar having an end plug or part 47 provided with a stud 46, and having at one end a pin 48, entering the bar, and at the other end a threaded hole; a fastening-screw 49 in the bar fitting said hole, an operating-handle turning on the bar, and a headed screw 45 passing from the outer end of the handle into the stud 46, substantially as described.

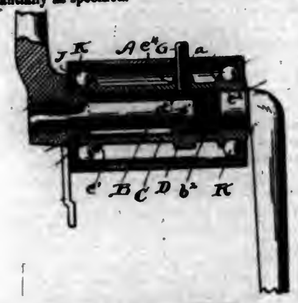
8. The combination, with the handle-bar and the brake-operating handle turning thereon, of a spring-latch 50 held to and within the bar and having at its free end a boss 54 fitting an opening in the handle-bar and carrying a latch-stud 52 adapted to engage a recess of the operating-handle, substantially as described.

9. The combination, with the brake-spoon cap-plate having slots formed with wide and narrow parts, of a brake-shoe having headed keys adapted to enter the slots and lock outside the plate, and latch-fastenings held to the cap-plate and locking the keys in the narrow parts of the slots.

10. The combination, with the brake-spoon cap-plate having two pairs of slots formed with wide and narrow parts, of a brake-shoe made in two independent side parts or blocks each having two headed keys adapted to enter the cap-plate slots and lock outside the plate, and latches held to the cap-plate and locking the keys in the narrow parts of the slots.

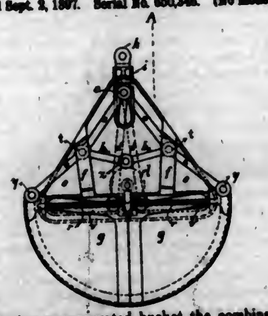
608,141. LOOM-SHUTTLE. STEPHEN M. HAMBLIN, Taunton, Mass., assignor of three-fourths to William H. Goldsmith, Central Falls, R. I. Filed Oct. 16, 1897. Serial No. 655,428. (No model.)

Claim.—1. The combination with a shuttle-body, and the shuttle-spindle of the improved bobbin-retaining device consisting of the independent and freely-swinging bail or loop journaled at its ends and into which the bobbin-head is carried by the descent of the shuttle-spindle, the main part of said bail or loop hanging below the journals thereof, whereby the bail or loop is made self-adjusting to accommodate itself to the portion of the bobbin-head with which it coacts, substantially as described.



2. The combination with a shuttle-body and the shuttle-spindle, of the improved bobbin-retaining device consisting of the bail or loop journaled at opposite sides of the shuttle-spindle, and into which the bobbin-head is carried by the descent of the shuttle-spindle, the main part of said bail or loop hanging below the journals thereof, whereby the bail or loop is made free to conform itself to the position and movement of the portion of the bobbin-head with which it coacts, substantially as described.

3. The combination with the shuttle-body, and the shuttle-spindle, of the bobbin-retaining device consisting of the bail or loop, the yoke or frame 55 provided with the eye 56 and having the said loop or bail journaled in its arms, and also having the head of the shuttle-spindle fitted between the said arms, the rivet 23 passing through the said arms and the said head, and the screw passing vertically through the said eye and securing the parts in place, substantially as described.

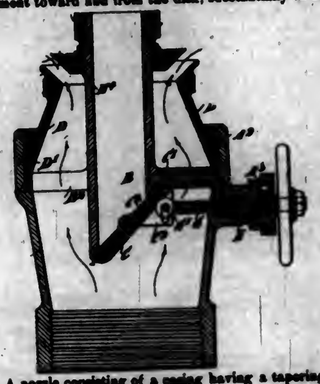


608,142. CRANK-SHAFT AND BEARING FOR BICYCLES. LOUIS R. HOFFMAN, Cleveland, Ohio. Filed Nov. 5, 1897. Serial No. 657,472. (No model.)

Claim.—1. The combination of a crank-hanger, a spool having bearings thereon, said spool having an internal shoulder and a threaded end, a nut in said spool engaging with said shoulder, a crank-shaft having a crank rigid with one end, an external shoulder on said end, and a threaded part which screws through said nut, a spider or crank which embraces the other end of said shaft and is screwed to said spool, and means for connecting said spider or crank and crank-shaft, substantially as specified.

2. The combination of a crank-hanger, a spool having bearings thereon, said spool having an internal shoulder and one internally-threaded end, a nut in said spool adapted to engage with said internal shoulder, a crank-shaft and a crank rigid therewith, said crank-shaft passing entirely through the spool, and having a threaded portion upon which the nut screws and an external shoulder adapted to engage with the end of the spool, a spider or crank which embraces the crank-shaft, and has a boss which screws into the threaded end of the spool, means for preventing the turning of the nut in the spool when the crank-shaft is being screwed in, means for preventing the rotation of the spool when the spider or crank is being screwed thereto, and means for connecting the spider or crank and crank-shaft, substantially as specified.

608,143. COAL OR ORE BUCKET. JAMES A. JOYCE, Cleveland, Ohio. Filed Sept. 2, 1897. Serial No. 650,346. (No model.)



Claim.—1. A power-operated bucket the combination with a frame, the bucket-sections pivoted on beams *k* movable in guides in the frame, the beam *o* movable in guides in the frame, and the links *a* and *c* connecting the movable beam *o* with the bucket-sections, the links, *d*, connecting movable beams *k* and *o*, the links *b* connecting links *a* and *c* to the frame, of a power-shaft mounted in a frame, an electric motor or other motive power for driving said shaft, mechanism for raising and lowering beam, *o*, and moving beams *k* to or from the middle of the frame; substantially as described.

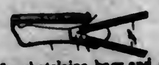
2. A power-operated bucket the combination with a frame, the bucket-sections pivoted on beams *k*, movable in guides in the frame, and the links *a* and *c* connecting the movable beam *o* with the bucket-sections, the links *d* connecting movable beams *k* and *o*, the links *b* connecting links *a* and *c* to the frame, of a power-shaft with right and left worm-screws *r'* at either end, mounted in the frame, and engaging worm-wheel *m* on screw-shaft *r*, an electric motor or other motive power for driving said power-shaft, substantially as described.

3. A power-operated bucket the combination with a frame, the bucket-sections pivoted on beams *k*, movable in guides in the frame, and the links *a* and *c* connecting the movable beam *o* with the bucket-sections, the links *d* connecting links *a* and *c* to the frame, of a pair of horizontal right and left screw-shafts *r* mounted in the frame and engaging threaded openings in beams *k*, an electric motor or other motive power for operating same substantially as described.

608,144. FIRE-HOSE NOZZLE. ELLSWORTH D. KELLERMAN and BENJAMIN C. CRANE, Montesano, Wash., assignors of one-half to R. C Story, same place, and W. I. Agnew, Olympia, Wash. Filed Jan. 26, 1898. Serial No. 668,256. (No model.)

Claim.—1. A nozzle having a casing, a portion of which is internally threaded, a threaded spider cooperating with the threads of the casing, a stream-pipe carried by the spider, the outer end of the stream-pipe projecting beyond the casing, a disk carried by the stream-pipe, and a nozzle proper having a threaded portion cooperating with the threads of the casing, the nozzle proper being capable of movement toward and from the disk, substantially as described.

2. A nozzle consisting of a casing having a tapering inner portion and a cylindrical inner portion, the cylindrical portion being internally threaded, a spider having threads cooperating with the threads of the cylindrical portion, a stream-pipe carried by the spider and projecting beyond the cylindrical portion of the nozzle, a disk carried by the outer end of the stream-pipe, a tapering nozzle proper having a screw-threaded portion cooperating with the threads of the cylindrical portion of the casing and being capable of movement toward and from the disk on the stream-pipe, and means for controlling the stream-pipe, substantially as described.

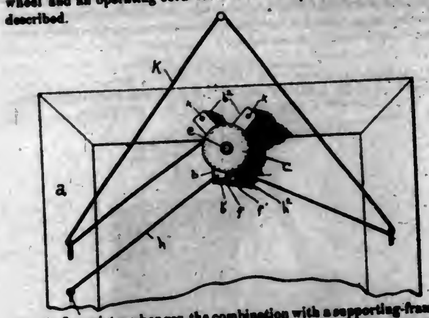


3. In a nozzle, the combination with a casing having a bearing and cap therefor, of a stream-pipe, a hinged valve capable of closing the stream-pipe, an internally-threaded sleeve having an annular collar, the sleeve being revolubly held within the bearing and the collar engaged with the cap thereof, and a belt connected to the valve and cooperating with the threads of the sleeve, substantially as described.

4. A nozzle having a casing, a portion of which is internally threaded, a threaded spider cooperating with the threads of the casing, a stream-pipe carried by the spider and projecting out of the casing, a disk held on the stream-pipe, a nozzle proper having adjustable connection with the casing and capable of movement to engage and disengage the disk, and a valve commanding the stream-pipe, substantially as described.

5. A nozzle having a casing, a stream-pipe held within the casing and having a diagonal inner end, a disk carried by the stream-pipe, a nozzle proper adjustable on the casing and capable of engaging and disengaging the disk, a valve pivotally mounted adjacent to the inner diagonal end of the stream-pipe and capable of moving to close or open the same, and means extending through the casing by which the valve may be operated, substantially as described.

6. A nozzle having a casing, a stream-pipe held within the casing and extending out of the same, a disk carried by the stream-pipe, a nozzle proper movable on the casing to engage and disengage the disk, a pivotally-mounted valve capable of movement to open and close the stream-pipe, and means extending through the casing by which the valve may be operated, substantially as described.



608,145. HOOK FOR CHATELAINE OR OTHER BAGS. JOHN KLEINSTUBER, New York, N. Y. Filed June 10, 1897. Serial No. 640,170. (No model.)

Claim.—A hook for chatelaine bags and similar articles, composed of sheet metal having a body portion provided with two recesses stamped therein near one end, with one end wall of each of said recesses removed forming holes adapted to receive suspending-straps, a narrow arm projecting from the opposite end and bent to form a hook, the outer edges of said hook being rolled over, and a fabric secured beneath said rolled edges, substantially as described.

608,146. PICTURE-HANGER. SIMEON LOEB, Philadelphia, Pa., assignor of one-half to Rhea Vurlenden, Darby, Pa. Filed Oct. 15, 1897. Serial No. 655,337. (No model.)

Claim.—1. In a picture-hanger, the combination of a spring-controlled winding-drum, a ratchet-wheel connected to said drum, with a frame on which to mount said drum and ratchet-wheel, a pawl pivoted on said frame and adapted to normally engage said ratchet-wheel and an operating-cord secured to said pawl, substantially as described.

2. In a picture-hanger, the combination with a supporting-frame, diverging arms extending from said frame, a right-angled portion integral with the lower end of said frame, a spring-controlled winding-drum mounted on said frame, a ratchet-wheel connected to said drum, a pawl pivoted to the frame and engaging said ratchet-wheel, a spring seated on the said right-angled portion under the pawl, and a cord or wire secured to the forward end of said pawl for operating the same.

608,147. PANEL. ARTHUR B. LORNEY, St. John, Canada. Filed Apr. 14, 1897. Serial No. 632,178. (No model.)

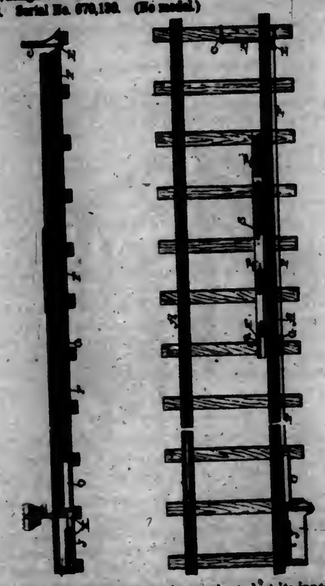
Claim.—1. In a panel, the combination of a wooden frame, the cross-rails of which have curved outer faces, a panel of artificial flexible fabric curved to correspond to the curvature of the rails fitted on the outer face thereof, and a series of wooden securing-strips on the outside of the panel, said strips being secured to the wooden frame, substantially as described.

2. In a panel, the combination of a wooden frame, the cross-rails of which have corrugated outer faces, a panel of artificial flexible fabric fitted on the outer face of said frame and being corrugated to correspond with the corrugations in the said rails, a series of wooden securing-strips on the outside of said panel, and means to secure the strips to the frame, substantially as described.

3. In a panel, the combination of a wooden frame, the cross-rails of which have curves on their outer faces, and the vertical posts of which are rabbeted to form a longitudinal shouldered recess, a panel of artificial flexible fabric bent to correspond to the curvature of the cross-rails and having its vertical edges engaging the shoulder of said recess, a series of wooden securing-strips arranged on the outside of said panel, the edges of the vertical strips and the ends of the horizontal strips abutting against the shoulders of said recesses, and means to secure said strips to the frame, substantially as described.

608,148. ADJUSTABLE SUPPORT FOR OPTICAL INSTRUMENTS. EMIL B. MEYROWITZ, Ridgefield, N. J., assignor to the Meyrowitz Manufacturing Company, same place. Filed Feb. 1, 1897. Serial No. 621,803. (No model.)

Claim.—In an adjustable support for optical instruments, a metallic stand of tripod or like form comprising upwardly-converging legs, a guide-forming collar between the upper ends of such legs, headed screws inserted from within outwardly to fixedly unite said legs and collar, and a bushing of Babbitt metal or the like within said collar which fastens said screws and forms a central guide-bore, substantially as hereinbefore specified



608,149. CRANK-HANGER FOR BICYCLES. THOMAS MIDDLEY, Columbus, Ohio, assignor of one-half to the Columbus Bicycle Company, same place. Filed Nov. 26, 1897. Serial No. 659,864. (No model.)

Claim.—1. A section for forming a built-up crank-hanger for a bicycle composed of a continuous piece of metal having a tubular body and a flat rectangular tang offset or projecting beyond the body on one side

2. A crank-hanger for bicycles composed of a tubular body or reinforcement and separate sections, each section having a tubular body and a flat rectangular tang overlapping the body of the adjacent section, in combination with semitubular reinforces on each side of the tangs and within the frame-tubes.

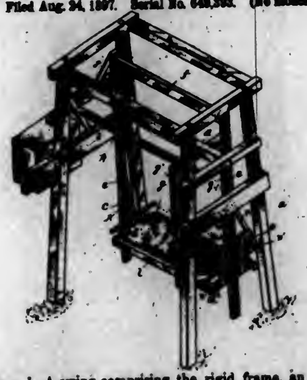
608,150. RAILROAD-SIGNAL. SAMUEL MILLS, Buckeye City, Ohio, assignor of one-half to James M. Mills, same place. Filed Feb. 12, 1898. Serial No. 670,193. (No model.)

Claim.—1. A slotted tread-lever, pivoted at its inner edges, and provided with a flange at its top where it bears against the rail, and a spring for returning the tread-lever to position after having been forced by the flanges of the wheels away from the inner edge of the

rail, combined with a pivoted lever which is operated by the endwise movement of the tread-lever when it is depressed by the flanges of the wheels, a connecting-wire, and a suitable signal connected to the forward end of the wire, substantially as described.

2. A tread-lever pivoted at its inner edges so as to be allowed to tilt or move away at its top beyond the inner edge of the rail, and which lever is provided with a flange which projects above the top of the rail, combined with a spring which is applied to the edge of the lever which is adjacent to the rail, for returning the lever to position, whereby the lever is given a tilting movement away from the rail when the train moves from one direction, substantially as set forth.

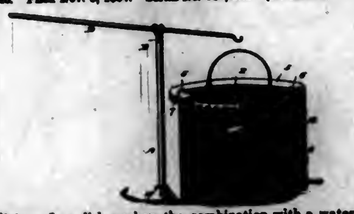
608,151. DEVICE FOR PREVENTING FRAUDULENT FILLING OF BOTTLES. BERNARD W. HORTON, Meriden, Conn. Filed Aug. 4, 1897. Serial No. 647,126. (No model.)



Claim.—1. The combination with the neck of a bottle formed with integral lugs projecting beyond its upper end, of a disk adapted to be set over the upper end of said neck, and formed with clearance-notches for said lugs, whereby said disk is held against rotation, said disk also formed with locking-fingers, and the cap also adapted to be set over the upper end of the said neck and interlocked with said cap through the instrumentality of said disk, substantially as described.

2. The combination with the neck of a bottle, of a cap adapted to be set over the upper end of said neck, one of said parts formed with frangible lugs and the other with grooves to receive them, of a disk also adapted to be set over the upper end of said neck upon which it is held against rotation, said disk formed with fingers for engagement with said cap, whereby the cap and neck are interlocked, substantially as described.

3. The combination with the neck of a bottle formed at its upper end with integral lugs, an external shoulder below the upper end of said neck, and notches in the sides of the neck above said shoulder, of a disk corresponding in diameter to the diameter of the upper end of said neck, and formed with notches, downwardly-turned fingers and upwardly-turned arms, and a cap adapted to be set over the upper end of said neck and formed at its lower edge with an inwardly-turned flange, in the opposite sides of which are notches, whereby the said cap may be interlocked with said neck through the instrumentality of said disk, substantially as described.



608,152. SWING. JOHN H. POUNCY, Quito, Tenn., assignor of one-half to Charles H. Pouncy and William D. Pouncy, Shelby County, Tenn. Filed Aug. 24, 1897. Serial No. 649,293. (No model.)

Claim.—1. A swing comprising the rigid frame, an oscillating frame pivoted therein, the movable chair-support pivoted at the top to said oscillating frame, a convertible chair carried by said support, an adjustable strap supporting the back of the chair, a movable seat carried by said back, a strap supporting said seat and a rigid foot-rest adapted to act as a support for said movable seat when the chair is converted into a couch, substantially as described.

2. A swing comprising the rigid frame *a*, carrying a motor *b*, the rock-shaft *d*, a swinging frame *e*, carried by said rock-shaft, a movable chair-support *f*, a convertible chair *g*, carried thereby, a strap *h*, supporting the back of said chair, a movable seat *m*, carried by said back, straps supporting said seat, a rigid foot-rest *o*, adapted to support the seat and the uprights *e*, to one of which the strap *h*, is secured, the other supporting the foot-rest *o*, when the chair is converted into a couch, substantially as set forth.

608,153. DISH-CLEANER. ADELLE ROBERTS, Monte Vista, Colo. Filed Nov. 8, 1897. Serial No. 657,831. (No model.)

Claim.—In a dish-washer, the combination with a water-receptacle, of a dish-cage supported in said water-receptacle to have a rotary motion therein, a rim secured to the upper end of said dish-cage and provided on its under side with gear-teeth, gear-wheels journaled to the side of the water-receptacle, one of said gear-wheels being in mesh with the teeth of the rim, substantially as set forth.

608,154. ELASTIC WHEEL FOR CARRIAGES. NIKOLAS ROSENBLATT and SIMEON ABRAMSOHN, St. Petersburg, Russia. Filed July 6, 1897. Serial No. 643,843. (No model.)

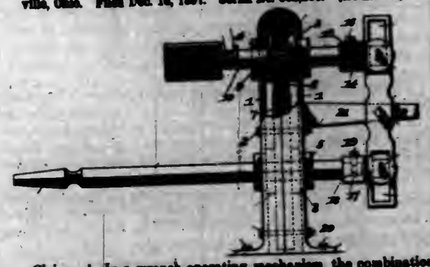
Claim.—1. In a vehicle-wheel, a tire of flexible yielding material having a series of perforations extending through the tire, each of said perforations terminating in an enlarged recess on the inner side of the tire, and a series of metallic plates projecting from the periphery of the tire and having shank portions extending through the said perforations, each of said shank portions having its end secured in the enlarged recess, substantially as specified.

2. In a vehicle-wheel, a cushion-tire having a series of radial perforations terminating in enlarged recesses in the inner side of the tire, and metal plates of less width than the tire and projecting beyond the periphery thereof, the said plates being provided with shanks extending through the said perforations and into the said enlarged recesses in the inner side of the tire, the shanks having their ends split and adapted to be bent outwardly to engage plates seated in said recesses, substantially as specified.

3. An elastic tire for wheels, comprising a rubber tire having shallow cavities formed on its external surface, a series of radial perforations extending through the tire and terminating on the inner side of the tire in an enlarged recess, and pins having shank portions extending through the said perforations, each pin having its shank end split and extending through a metallic ring held in said enlarged recess, the said pins having enlarged heads shaped to correspond with the shallow cavities on the external surface of the tire, the outer surface of said heads being slightly convex and projecting beyond the external surface of the tire, the split ends of the shanks being bent upon the said rings, substantially as shown and described.

4. In a vehicle-wheel, the combination with a tire of flexible yielding material and a metallic rim embracing the sides of said tire, the tire being provided with a series of radial perforations each terminating on the peripheral surface of the tire in a shallow cavity and on the inner surface adjacent to the rim in an enlarged recess, of a series of metal pins provided with approximately rectangular heads the inner surface of which corresponds to the shallow cavities in the peripheral surface of the tire, the outer surface of said heads being convex and projecting beyond the periphery of the tire, but terminating short of the sides thereof, the shank portions of said pins extending through the perforations in the tire and the inner end of each shank portion being secured in the said enlarged recess, substantially as specified.

608,155. FOOT-REST. ELDRIDGE J. SMITH, Washington, D. C., assignor to the Smith Flexible Chair Manufacturing Company of Virginia. Filed June 11, 1897. Serial No. 640,293. (No model.)



Claim.—1. As a new article of manufacture, a rocking foot-rest comprising the rockers 1, each having a pair of standards 2, rising upward therefrom, the standards of each pair meeting and joined at their upper ends, horizontal brace-rods 3, connecting said standards, a top or head pivoted to the upper ends of said standards and consisting of the side pieces 4, and series of cross-rods 5, said side pieces having downwardly-curved ends, a cushion or pad seated upon said cross-rods, and an upholstering-strip secured to the side pieces and extending downward over the curved ends whereby the cushion or pad is retained in position without other fastening means, substantially as described.

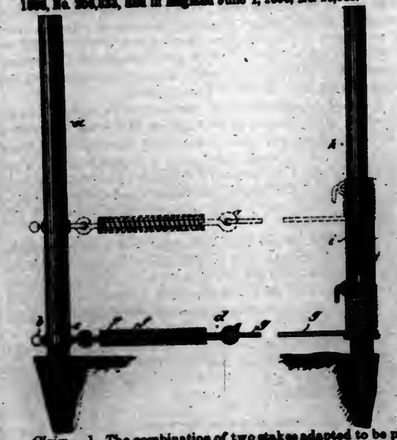
2. As a new article of manufacture, a foot-rest comprising a rocking frame, a top or head for said frame, a pair of angular brackets each having its horizontal portion secured to the under side of the top or head, and its vertical portion pivoted to the frame, a part of the vertical portion of each bracket being cut away to form stops, a pin projecting from each side of the frame in the path of the said stops to limit the oscillating movement of the head, and a spring secured to the frame and having its free ends acting upon the under side of the head on each side of its point of pivotal connection, substantially as described.

3. As a new article of manufacture, a foot-rest comprising a rocking frame, a top or head pivoted to said frame, and consisting of a pair of parallel side pieces and a series of horizontal connecting-rods, said side pieces having grooved inner edges and downwardly-curved ends, a cushion or pad seated upon said connecting-rods, and an upholstering-strip secured to the side pieces and having its side edges seated within the said grooves, said upholstering-strip being arranged to retain the cushion or pad in position without other fastening means, substantially as described.

608,156. WRENCH-WRENCH. CHARLES W. SPENCER, Jeffersonville, Ohio. Filed Dec. 14, 1897. Serial No. 662,200. (No model.)

Claim.—1. In a wrench-operating mechanism, the combination with an operating-shaft, and a wrench-carrying shaft both supported to have rotary and longitudinal movement, of gearing to transmit rotary movement from one shaft to the other, and a lever fulcrumed between its ends and pivotally connected with the shafts, whereby the shafts are simultaneously reciprocated in opposite directions, substantially as described.

2. In a wrench-operating mechanism, the combination with an operating-shaft, and a wrench-carrying shaft both supported to have rotary and longitudinal movement, of gearing to transmit rotary movement from one shaft to the other, and a yoke or lever fulcrumed between its ends and pivotally connected with the rear ends of the shafts, the pivotal connections being capable of movement longitudinally of the yoke or lever, substantially as described.



3. In a wrench-operating mechanism, the combination with a supporting-casing, of an operating-shaft and a wrench-carrying shaft both supported to have rotary and longitudinal movement in said casing, and each having a ball on one end, gearing to transmit rotary movement from one shaft to the other, an arm projecting horizontally from the casing, and a slotted tubular yoke pivoted intermediate its ends on said arm and in which the said balls are loosely fitted, substantially as described.

4. In a wrench-operating mechanism, the combination with an operating-shaft and a wrench-carrying shaft, both supported to have rotary and longitudinal movement, and each having a ball on one end and a neck portion connecting the ball to the body of the shaft, gearing to transmit rotary movement from one shaft to the other, a yoke comprising an open-ended tube having a slot extending from end to end, said yoke being pivoted intermediate its ends on a suitable support and the balls on the shafts being loosely seated in the tube on opposite sides of its pivot and the neck portions of said shafts extending through the slot, substantially as described.

5. In a wrench-operating mechanism, the combination with the wrench-head supported to have rotary and longitudinal movement, of a nut-ejector supported in the head to have longitudinal movement therein, substantially as described.

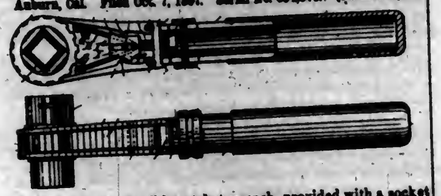
6. In a wrench-operating mechanism, the combination with the wrench-head supported to have rotary and longitudinal movement, of a nut-ejector comprising an angular block and a pair of arms extending rearwardly therefrom, said block being loosely supported in the nut-receiving opening in the head and the arms in ways in said head, and said arms projecting beyond the rear end of the head and adapted to be engaged with a fixed part, substantially as described.

608,157. MARKING-CORD. OTTO K. SITTENBERG, Thurandt, Germany. Filed Dec. 22, 1897. Serial No. 663,095. (No model.) Patented in Germany Sept. 26, 1895, No. 84,905; in Austria June 1, 1896, No. 46/2,431; in Hungary June 1, 1896, No. 6,095; in France June 1, 1896, No. 254,223, and in England June 1, 1896, No. 11,915.

Claim.—1. The combination of two stakes adapted to be planted vertically in the ground, a movable socket attached to one stake, a cylinder in connection with said socket, a rod slidable in the cylinder, a spring in connection with the cylinder and rod, whereby to normally draw the rod within the cylinder, a cord attached to the rod, a reel embracing the remaining stake and having the cord wound thereon, and a spring attached to the interior wall of the reel, the stake of the reel having a groove receiving the spring, whereby to hold the reel.

2. In a marking apparatus, the combination of a stake having a longitudinally-extending groove therein, a reel fitted on the stake and movable thereon and a spring attached to the reel and extending into the slot in the stake, whereby to adjustably hold the reel.

3. In a marking apparatus, the combination of two stakes, a tension device in connection with one of said stakes, a reel movable on and surrounding the other of said stakes, a spring attached to the reel and engaging the stake thereof, and a cord in connection with the reel and with the tension device.



608,158. WAIST-BELT ATTACHMENT. CLEMENT L. STEPHENSON, New York, N. Y., assignor to Helen G. Stephenson, same place. Filed June 16, 1897. Serial No. 641,014. (No model.)

Claim.—A belt having an opening formed therein, an eye attached to the inner side of the belt and located adjacent to the opening, and a wire secured in the eye and having portions lying snugly against the inner side of the belt, the terminals of the wire being

passed through the belt and projected outwardly and upwardly to form hooks at the outer side thereof.

608,159. REVERSIBLE RATCHET-WRENCH. ELIAS M. TYLER, Auburn, Cal. Filed Oct. 7, 1897. Serial No. 654,573. (No model.)

Claim.—1. A reversible ratchet-wrench, provided with a socket having a ratchet-wheel, spring-pressed pawls engaging the said wheel at opposite sides, the pawls being provided on their inner faces with inclines, and a cam block mounted between and to slide longitudinally of the pawls to alternately engage them, and arms attached to the cam-block and engageable by the operator, substantially as described.

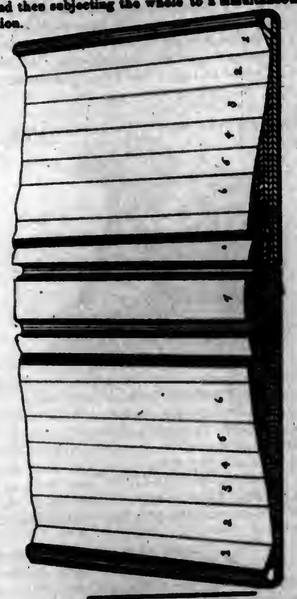
2. A reversible ratchet-wrench comprising a casing, a socket mounted to turn in the said casing and provided with a ratchet-wheel, spring-pressed pawls for engagement with the ratchet-wheel at opposite sides, the pawls being pivoted in the said casing and provided at their inner faces with inclines, a movable cam-block within the said casing and provided with cam-faces, for engagement with the said inclines to throw either of the said pawls out of mesh with the ratchet-wheel, and a ring slidable on the said casing and connected with the said block, substantially as shown and described.

3. A reversible ratchet-wrench, provided with a socket having a ratchet-wheel, spring-pressed pawls engaging said wheel on opposite sides, the pawls being provided in their inner faces with inclines, a cam-block between the pawls and having a longitudinal slot, a pin passing through said slot, a rearward extension of said block having guiding contact with the handle, a cross-pin fixed to said extension and projecting outside the handle, and a ring fixed to said pin and surrounding the handle.

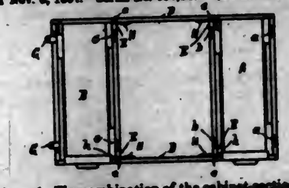
4. A reversible ratchet-wrench provided with a casing comprising two plates spaced apart and formed with semicylindrical extensions, a handle screwing on the said extensions, a clamp engaging the plates at the extensions, the said clamp being provided with lugs projecting over part of the cylindrical extensions, substantially as shown and described.

5. A reversible ratchet-wrench provided with a socket having a square end formed with a recess, and an auxiliary socket fitted upon the said end and carrying a spring for engagement with the said recess, substantially as shown and described.

608,160. CYCLE-WHEEL. WILLIAM J. R. WATSON, Antwerp, Belgium. Filed Apr. 2, 1897. Serial No. 630,465. (No model.) Patented in England Mar. 4, 1897, No. 5,751.



Claim.—1. The combination in a bicycle-wheel of the hub, the straight and dished disks, one arranged centrally on said hub, the spokes secured to said disk about midway between the rim and the hub, by which the strength of the wheel is maintained and the distance between the pedals is diminished for the purpose set forth.



2. The combination in a bicycle-wheel of the axle, a sleeve or bushing to fit said axle, a concave or dished disk on said sleeve, and spokes extending to the rim from said dished portion and a straight side, all arranged to bring the drive-chain near the center of the hub, substantially as set forth.

608,161. MANUFACTURE OF RESILIENT OR PNEUMATIC TIRES. CHARLES F. A. H. BAGOT, London, England, assignor to the Bagot Pneumatic Tyre Company, Limited, same place. Filed June 22, 1897. Serial No. 641,831. (No model.)

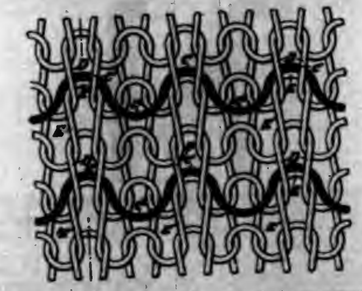
Claim.—The manufacture and production of tires or tire-coverings by first preparing several mixtures of rubber and sulfur with varying proportions of sulfur and then forming them into layers or strips, then applying the said layers or strips of such different mixtures one upon the other to a mold or mandrel so that the layer or strip which, in the finished tire, is outermost, contains most sulfur the other layers or strips being applied in the order according to the amount of sulfur they contain that containing least sulfur being last applied, and then subjecting the whole to a simultaneous process of vulcanization.

608,162. DESK. WILLIAM H. BAKER, Parkersburg, W. Va., assignor to the Bentley & Gerwig Furniture Company, same place. Filed Nov. 8, 1897. Serial No. 657,845. (No model.)

Claim.—1. The combination of the cabinet-sections A B provided with mortises *a b c* and having vertical rails E provided at the top with mortises *b c* the knee-rails D having tenons *d* to engage the mortises *c* and hooks H to engage in the mortises *b*, and the top T having its under side provided with catches C to engage the mortises *a b c*, substantially as described.

2. In combination with the cabinet-sections A, B, provided with mortises *a, b, c*, and ears G, the top T, provided with catches C adapted to engage said mortises, and clamping-screws for securing said top to said ears, substantially as specified.

608,168. GATE. CHESTER BALL, Belleville, Kans. Filed Sept. 10, 1897. Serial No. 651,201. (No model.)



Claim.—1. In gates, the combination of the gate-posts carrying latch-keepers, a gate hinged to said posts to tilt down and rest upon the surface of the ground, an eyebolt on each fence-post contiguous to said gate-posts, a spring attached to the eye of each bolt, a cord, rope or cable connected at one end with said spring passed around pulleys on the gate-posts and connected at its other end with the gate, whereby the gate is adapted to close automatically, and a latch device to hold the gate open against the tension of said springs, substantially as described.

2. In a gate, the combination of the gate-posts, a gate hinged thereto at its lower end to tilt down and rest upon the surface of the ground, said gate having an end picket or bar provided with a trackway, a bar carrying a frictional roller traversing said trackway, an L-shaped lever having one arm thereof passed through an opening in one of the gate-posts and connected with said bar and its other end arranged to form a handle, and means for automatically closing the gate after passage of a person or vehicle thereover, substantially as described.

3. In gates, the combination of the gate-posts, the fence-posts adjacent thereto, a latch-post on one side of the gateway in line with one of the gate-posts, a gate hinged to said gate-posts and adapted to tilt down in opening and rest upon the surface of the ground, a spring-actuated latch on said latch-post adapted to engage the gate and hold it open, springs connected with the fence-posts, and cords or cables connecting the said springs and gate, substantially as described.

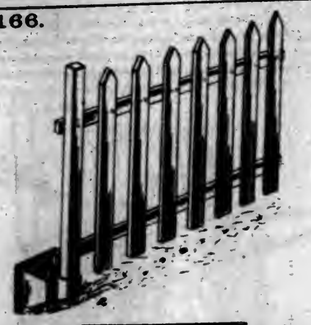
4. In a gate, the combination with the posts carrying hinge members formed with elongated loops, of a downwardly-tilting gate having hinge members consisting of pintles bifurcated to receive the loops of the hinge members carried by the posts, and carrying pintles which move in said loops, substantially as described.

608,164. RIBBED-KNIT PILE FABRIC. THEODORE S. RADEL and WILLIS A. INGALLS, Brooklyn, N. Y., assignors to Radel, Straus & Co., same place. Filed Jan. 29, 1896. Serial No. 577,985. (No model.)

Claim.—A ribbed-knit fabric having on its inner or wearing surface a pile-facing formed of extra or pile threads, said extra or pile threads being united with the inner wales or ribs of the fabric and floating over the intermediate outer wales or ribs, thus forming on the face of the fabric a projecting pile covering the outer wales, said extra or pile thread being secured to the inner wales by passing loosely behind the loops of said wales and lying intermediate the loops of the courses above and below, whereby the pile-threads will reinforce and protect the body of the fabric, and pile-threads of various thickness may be employed, and also whereby a pile may be made of loops of any desired thickness and length, and the pile may be conveniently fleeced, napped or sheared without liability of injury to the body of the fabric, substantially as described.

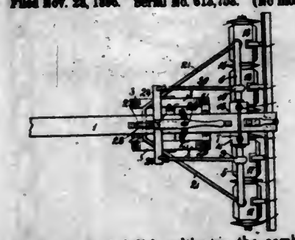
608,165. FOOD PRODUCT AND PROCESS OF MAKING SAME. ALEXANDER RAMSPERGER, Boston, Mass. Filed Dec. 13, 1897. Serial No. 661,720. (No specimens.)

Claim.—1. The process of obtaining a substitute for eggs from milk, which consists in coagulating both the casein and albumen of the milk, removing the liquid and then mechanically reducing the mixed curd to the consistency of paste, substantially as described.



2. As an article of manufacture, a substitute for eggs, consisting of coagulated milk, albumen and fibrinaceous curd intermingled and in a finely-divided condition, substantially as described.

3. As an article of manufacture, a substitute for eggs consisting of coagulated milk albumen and uncooked casein intermingled and in a finely-divided condition, substantially as described.



608,166. FENCE-POST. WILLIAM BOWMAN, Mill Grove, Mich. Filed Nov. 20, 1897. Serial No. 659,297. (No model.)

Claim.—A fence-post comprising a base having an independent socket on one side of the upper portion thereof, the said base being of cast metal and the socket of wrought metal, a post removably fitted in said socket, and bolts passed through the socket-post and the adjacent wall of the base and holding the several parts in removable relative position to each other, the said base being hollow and adapted to be filled with suitable weighting material, substantially as described.

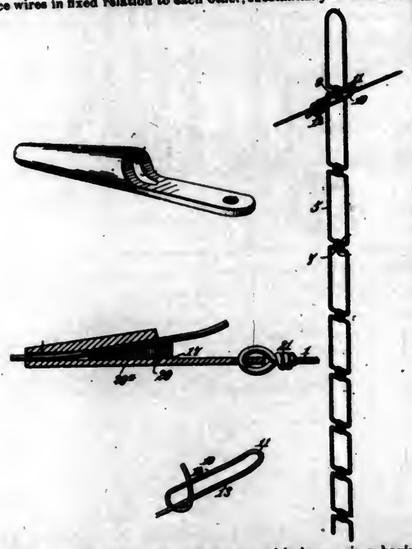
608,166.

608,167. DISK CULTIVATOR. GEORGE K. BERENDS, Porterville, Kans. Filed Nov. 22, 1896. Serial No. 613,758. (No model.)

Claim.—1. In a wheeled disk cultivator, the combination with the draft-beam, of the disk-supporting frames pivotally connected therewith and having each a pendent rigid arm and a pendent arm, adapted to swing on the horizontal frame-arm the disk-shafts having a swiveling connection with said arms, an adjustable cross-bar connected with the pendent swinging arms for simultaneously swinging the disk-shafts on the rigid arms for adjusting the angle of presentation of the disks, and means for adjusting said cross-bar longitudinally upon the machine.

2. In a wheeled disk cultivator, the combination with the disk-shafts and disks carried thereby, of overhanging frames pivoted to swing in a vertical plane and having pendent rigid arms pivoted to the disk-shafts, supplemental suspending arms pivotally connected to the disk-shafts and also pivoted at points in alinement with the pivotal points of the suspending frames, means for swinging the suspending frames forwardly and upwardly, and independent means for swinging the supplemental arms independently of the suspending frames, whereby the disk-shafts can be simultaneously set at any desired inclination to a transverse line.

3. In a disk cultivator, the combination with depending frame-pieces adapted to swing upwardly, of supplemental pivoted members, sets of cultivator-disks carried by the main frame-pieces and the supplemental members, rods connected to the frame-pieces and movable longitudinally of the machine, a controlling-lever connected to said rods for operating said frame, a pivoted cross-bar, rods connecting the same to the supplemental members, a shifting lever adapted for lateral movement and to which the controlling-lever is pivoted, and means for locking the said shifting lever.



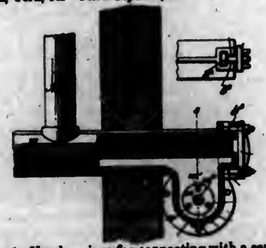
4. In a wheel disk cultivator, the combination with the pendent rigid arm of the supporting-frame pivoted to swing forwardly and upwardly, of supplemental members pivoted to the frame-piece and also adapted to swing forwardly and upwardly, disk-shafts pivoted to the frame-piece and to the supplemental members, disks carried by said shafts, a cross-bar pivotally connected with and movable longitudinally of the machine, a controlling-lever having its extremity pivoted to the main frame and which is also pivoted to the cross-bar, rods connecting the ends of said cross-bar and the supplemental members, a shifting lever secured to the cross-bar for adjusting the angle thereof, and means for locking said lever at any desired adjustment.

608,168. WIRE FENCE. DANIEL W. BRADLEY, Wilmore, Ky. Filed Dec. 31, 1897. Serial No. 666,111. (No model.)

Claim.—1. In a wire fence, the combination with brace-wires having inward-extending overlapping bends forming openings, of strand-wires passing through said openings and a locking-hoop securing said strand and brace wires in fixed relation to each other, substantially as described.

2. In a wire fence, the combination with brace-wires having

inward-extending overlapping bends forming openings, of strand-wires passing through said openings and having at their junction with said brace-wires a bend, and a locking-loop securing said strand and brace wires in fixed relation to each other, substantially as described.



3. In a wire fence, the combination with brace-wires having inward-extending overlapping bends forming openings, of strand-wires passing through said openings and locking-wires passed under said bends on either side of the strand-wires and bent over said strand-wires on either side of said brace-wires and having each an end twisted around said locking and strand wires, substantially as described.

4. In a wire fence, the combination with brace-wires having inward-extending overlapping bends forming openings, of strand-wires passing through said openings and having at their junction with said brace-wires a bend, and locking-wires passed under said bends on either side of the strand-wires and bent over said strand-wires at the bases of the bends in said wires and on either side of said brace-wires, and having each an end twisted around said locking and strand wires, substantially as described.

5. A locking-loop for the strand and brace wires of a fence comprising a single piece of wire bent upon itself to form two parallel arms one of said arms having an end bent at right angles to itself and extending across the opposite arm, substantially as described.

608,169. MULTIPLE-TUBE WATER-HEATER. ALBERT P. BROMBELL, York, Pa. Filed Sept. 20, 1897. Serial No. 653,523. (No model.)

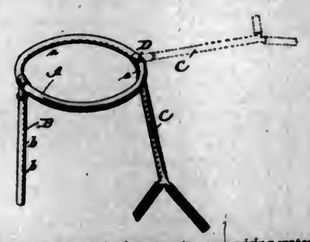
Claim.—1. Header-pipes for connecting with a series of circulating-pipes at right angles, said header-pipes having formed on their ends and on one side of their longitudinal axes short flanged sleeves in open communication with the header-pipes, the said sleeve of each header-pipe being offset to one side of said pipe and arranged at right angles to it, to form when joined together a continuous conduit, and the end of said header-pipe being provided with an opening and detachable cap giving direct access to the header along its longitudinal axis and outside the said sleeve, substantially as and for the purpose described.

2. The combination of a series of circulating-pipes, two sets of header-pipes joining onto their ends and having each a common conduit at right angles to the headers, formed by sectional offsetting sleeves arranged at right angles to the headers and bolted together, multiple valves arranged in these two conduits to close communication between the series of pipes alternately at opposite ends to direct the water through them, either without interruption, or with a winding and prolonged course, and detachable caps arranged at the ends of the lower headers above the valve-conduit, substantially as described.

3. The multiple valve comprising end disks connected by longitudinal parallel bars arranged at the periphery of the disks, said end disks being perforated centrally and connected by bolts; in combination with a conduit or casing having inwardly-projecting flanges containing said valve, substantially as and for the purpose described.

4. The header-pipes having at or near their ends offsetting sleeves whose longitudinal axes are at right angles to that of the headers, said sleeves having both external and internal flanges, and said external flanges being bolted together, and the internal flanges forming valve-seats, and the multiple valve having a series of disks connected in longitudinal alinement and arranged to be simultaneously adjusted between the flanges, or in the plane of the flanges, substantially as and for the purpose described.

608,170. CAR. JOSEPH P. CALDWELL, New Wilmington, Pa. Filed Apr. 22, 1897. Serial No. 633,205. (No model.)

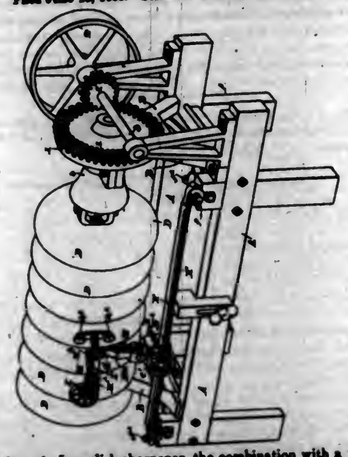


Claim.—1. The combination with a car, of towers built in the same adjacent one end, a chamber extending transverse the car and communicating with the towers, and doors for the chamber or compartment, substantially as described.

2. The combination with a car, of towers built within the same and projecting above the roof thereof, said towers also projecting below the car, port-holes therein, port-holes in the towers, an arch connecting the towers, and communications between the towers and car, substantially as described.

3. A car having towers projecting from the sides thereof and extending above the roof of the same, an arch connecting the towers and establishing communication therebetween at the top of the car, the towers opening to the interior of the car at their lower ends, substantially as set forth.

4. A car having towers projecting from the sides thereof, an arch connecting the towers within the car, partitions dividing the towers into upper and lower compartments, doors controlling openings through the partitions, the walls of the towers provided with port-holes, the towers communicating with the interior of the car at their lower ends, and doors controlling said communications, substantially as set forth.



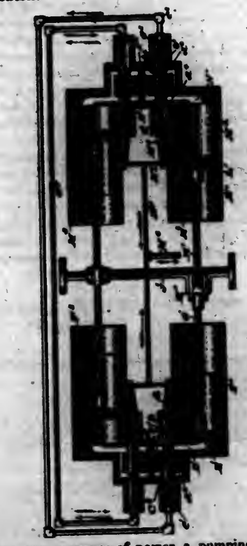
608,171. SHOWER-BATH APPARATUS. WILLIAM H. CALLAGHAN, Toronto, Canada. Filed Nov. 4, 1897. Serial No. 657,404. (No model.)

Claim.—1. A shower-bath apparatus comprising water-tap connections, a perforated head or ring adapted to be passed over the head and to rest upon the shoulders of the bather, said head or ring having a perforated pipe in communication also with said water-tap connections, and arranged to adapt itself to the size and form and to distribute the streams of water across the front of the body of the bather, substantially as set forth.

2. A shower-bath apparatus comprising flexible water-tap connections, a perforated head or ring adapted to be passed over the head and to rest upon the shoulders of the bather, a rigid perforated extension from the rear part of said head or ring adapted to maintain same in place and to direct the streams of water toward the back, and an adjustable perforated pipe in direct connection with the water-supply and with the head or ring, and arranged to adapt itself to the size and form and to distribute the streams of water across the front of the bather's body, all combined and arranged substantially as set forth.

608,172. DISK-SHARPENER. ARIE CHEESEWRIGHT, Canton, S. D. Filed June 18, 1895. Serial No. 553,249. (No model.)

Claim.—1. In a disk-sharpener, the combination with a frame, a shaft adapted to have mounted thereon the disks to be sharpened, bearings therefor, and means for rotating said shaft, of a supplemental shaft parallel to said main shaft, and distant therefrom more than the radius of the disk to be sharpened, a knife-support adjustably mounted thereon, and solely carried thereby and a sharpening-knife, substantially as described.



2. In a disk-sharpener, the combination with a frame, a shaft adapted to have mounted thereon the disks to be sharpened, bearings therefor, and means for rotating said shaft, of a supplemental shaft parallel to said main shaft and distant therefrom more than the radius of the disk to be sharpened, a knife-support consisting of two sections, one section being adjustably mounted on said supplemental shaft, and solely carried thereby and the other section, bearing the sharpening-knife, being pivotally connected to the outer end of the first section, a knife, and means for holding the same against the edge of the disk to be sharpened, substantially as described.

3. In a disk-sharpener, the combination with a frame, a main shaft adapted to have mounted thereon the disks to be sharpened, bearings therefor, and means for rotating said shaft, of a supplemental shaft parallel to said main shaft and distant therefrom more than the radius of the disk to be sharpened, said supplemental shaft being adjustable as to its distance from the main shaft, a knife-support consisting of two sections, one section being adjustably mounted on said supplemental shaft, and solely carried thereby and the second section bearing the sharpening-knife, and being pivotally connected to the outer end of the first, a knife, and means for holding the same against the edge of the disk to be sharpened, substantially as described.

4. In a disk-sharpener, the combination with a frame, a main shaft adapted to have mounted thereon the disks to be sharpened, bearings therefor, and means for rotating said shaft, of a supplemental shaft parallel to said main shaft but distant therefrom more than the radius of the disks to be sharpened, a knife-support adjustably mounted thereon, said knife-support being made in two parts hinged together, a knife, and a bracket H', angled arm H^3 bearing trolley-wheels A^3, screw I, and spring J for holding said knife against the disk to be sharpened, substantially as described.

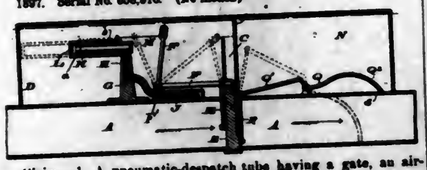
608,173. MOTOR. HENRY CLAY, Pulwood, Pa., assignor to Joseph Johnson, trustee, Philadelphia, Pa. Filed Aug. 9, 1897. Serial No. 647,817. (No model.)

Claim.—1. In a motor, a reservoir, a plurality of cylinders, valve-chests therefor, ports in said chests leading into the ends of said cylinders, controlling-valves for said ports, pressure-chambers at the ends of said valves, the chamber located at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder, and the chambers at the other ends of the said valves having a connection common thereto, an exhaust connection from said cylinders to said reservoir, and means for conducting fluid-pressure to said valve-chests.

2. In a motor, a source of power a pumping device actuated thereby, a reservoir, a suction-pipe leading from said reservoir to said pumping device, a discharge-pipe leading from said pump to a reversing-valve, a discharge-pipe leading from said reversing-valve to said reservoir, a connection intermediate said discharge-pipes having a throttle-valve therein, cylinders oppositely arranged, a plurality of valve-chests, valves in the latter, ports common to said valves and cylinders and controlled by said valves, pressure-chambers at the ends of said valves, the chamber located at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder and the chambers at the other ends of said valves having connections common thereto and pipes leading from said valve-chests to said reversing-valve.

3. In a motor, a source of power, a pumping device actuated thereby, a reservoir, a suction-pipe leading from said reservoir to said pumping device, a reversing-valve, a discharge-pipe leading from said pump to said reversing-valve, a discharge-pipe leading from said reversing-valve to said reservoir, a plurality of cylinders oppositely arranged, pistons in said cylinders, a crank-shaft intermediate of said cylinders, connections common to said pistons and crank-shaft, a plurality of valve-chests, automatically-operated valves in said chests, ports common to said chests and cylinders and controlled by said valves, pressure-chambers at the ends of said valves, the chamber located at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder and the chambers at the other ends of said valves having connections common thereto, pipes common to each set of valve-chests and a connection from each of said pipes with said reversing-valve.

4. In a motor, a pumping device, means for actuating the same, a reservoir, a suction-pipe leading from said reservoir to said pumping device, a plurality of cylinders, valve-chests therefor, a discharge-pipe leading from said pumping device to said valve-chests, ports leading into the ends of said cylinders, controlling-valves for said ports, pressure-chambers at the ends of said valves, ports d' and M^3, common to each of said cylinders and its chest, said ports d and M^3 leading from said cylinders to the adjacent pressure-chambers, the pressure-chambers at the other ends of said valves having connections common thereto, and pistons in said cylinders, said pistons having a bridge therein, said bridge being adapted to enable a communication to be made from said ports d and M^3 to said reservoir.



5. In a motor, a reservoir, a plurality of cylinders, valve-chests therefor, ports in said valve-chests leading into said cylinders, the inlet-ports of each adjacent set of cylinders being in communication, controlling-valves for said ports, passages in said valve-chests in communication with said inlet-ports, offset therefrom, and controlled by

said valves, pressure-chambers at the ends of said valves, the chamber at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder, and the chambers at the other ends of said valves, having a connection common thereto, an exhaust connection from said cylinder to said reservoir, and means for conducting fluid-pressure to said valve-chests.

6. In a motor, a reservoir, a plurality of cylinders, valve-chests therefor, ports in said chests leading into said cylinders, controlling-valves for said ports, pressure-chambers at the ends of said valves, the chamber located at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder, and the chambers at the other ends of said valves having a connection common thereto, an exhaust connection from said cylinders to said reservoir, pipes for conducting fluid-pressure to said valve-chests and a throttle and reversing-valve in said pipes.

7. In a motor, a plurality of cylinders, valve-chests therefor, ports in said chests leading into said cylinders, controlling-valves for said ports, pressure-chambers at the ends of said valves, the chamber located at one end of each of said valves being adapted to be thrown into communication with the adjacent cylinder, and the chambers at the other ends of said valves having a connection common thereto, and means for conducting fluid-pressure to said valve-chests.

608,174. PNEUMATIC-DESPATCH TUBE. HENRY CLAY, Fernwood, Pa., assignor to John Stinguff, Norristown, Pa. Filed Nov. 17, 1897. Serial No. 658,810. (No model.)

Claim.—1. A pneumatic-despatch tube having a gate, an air-chamber in direct and unobstructed communication with said tube in advance of said gate, a movable member fitted to said chamber and a connection common to said member and gate whereby the latter may be directly opened by the pressure of the air or fluid intermediate of said gate and the advancing carrier.

2. The combination of a pneumatic-despatch tube, a gate located therein, an air-chamber in communication with said tube, a movable element operated by air-pressure and supported by said chamber, a connection common to said gate and element, means connected with said gate for closing the same, one end of said means being adapted to enter said tube beyond said gate, a chamber located adjacent to the latter and inclosing said air-chamber and gate-closing means, and a partition intermediate of the latter and said gate.

3. The combination of a pneumatic-despatch tube, a gate located therein, an element operated by fluid-pressure, means for conducting said pressure directly to said element from a point in front of said gate, a connection common to said element and gate whereby the two latter operate in unison and mechanism connected with said gate for closing the same, said mechanism being positively operated by the progression of the carrier beyond said gate.

4. In a pneumatic-despatch tube, a gate and means for automatically opening the same by the air-pressure created by an advancing carrier, the conduit for said air having a direct and unobstructed communication with said tube in combination with mechanism connected to said gate for closing the latter and means for enabling said mechanism to be positively operated by the progression of said carrier beyond said gate.

5. A pneumatic tube having a sliding gate therein, a chamber above said tube, a standard with an air-passage therein, a pipe leading from said tube to said air-passage, an air-chamber supported on said standard and in communication with said air-passage, a member movable on said air-chamber, and adapted to close one end thereof, and a lever and link connecting said gate and member.

6. A pneumatic-despatch tube having a gate, an air-chamber communicating with said tube, a member movable on said chamber, means connecting the movable member on said chamber and the gate on one side of the latter, means connected with the other side of the gate for closing the same and having one end adapted to enter a slot in said tube in position to be struck by a carrier and a partitioned casing beside said pneumatic tube and in which the operating mechanisms are located.

7. A pneumatic tube having a gate with levers connected therewith on opposite sides, for opening and closing the same, an air-actuated member which is connected with the opening-lever, and an air-chamber and a pipe in communication with said member and tube, the closing-lever being adapted to enter a slot in said tube, so as to be in the path of the advancing carrier in the tube.

8. In a pneumatic-despatch tube system, a gate in the tube thereof, an air-chamber in communication with said tube, a movable member fitted to said chamber and a connection common to said member and gate, said chamber and member being respectively provided with ports which are adapted to be placed in communication when said member has been sufficiently operated.

9. In a pneumatic-despatch tube system, a main tube having a gate within the same, an air-chamber in direct and unobstructed communication with said tube in advance of said gate, a movable member fitted to said chamber, a connection common to said member and gate, whereby the latter may be directly opened by the pressure of the fluid intermediate of said gate and an advancing carrier, branches connected with said tube on opposite sides of said gate, one of said branches leading to an intermediate station at the end of a section, and the other branch being adapted to be connected with a new source of fluid or air supplying a new section at the beginning thereof, the continuity of said main tube being preserved.

608,175. MACHINE FOR FORMING SPRINGS. CHARLES COLLINS, Los Angeles, Cal. Filed Dec. 11, 1896. Serial No. 615,409. (No model.)

Claim.—1. The combination set forth of a forge provided with journal-bearings arranged upon opposite sides of the fire-bed; a spring-forming cylinder provided with a shaft or stem journaled in the bearings and adapted to travel axially across the fire-bed: means for clamping the end of a rod to the cylinder; and means for rotating the cylinder.

2. The combination set forth of a forge provided with journal-bearings arranged upon opposite sides of the fire-bed; a cylinder arranged above the fire-bed and provided with a shaft journaled in the bearings, one of such bearings being screw-threaded, and one end of the shaft being provided with screw-threads adapted to screw through the bearings; and suitable means for clamping the end of a rod to the cylinder.

3. The combination set forth of a spring-forming cylinder provided with a smooth shaft at one end and a screw-threaded shaft at the other end; a smooth bearing for the smooth end of the shaft arranged to allow the shaft to reciprocate axially therethrough; a screw-threaded bearing for the screw-threaded end of the shaft; the screw-threads being of the same pitch as the pitch of the spiral of the spring to be formed.

4. The combination set forth of a forge provided with journal-bearings arranged upon opposite sides of the fire-bed; a cylinder arranged above the fire-bed and provided with a shaft journaled in the bearings, such cylinder being provided with grooves, and one of the bearings being screw-threaded and one end of the shaft being screw-threaded and adapted to screw through the bearing, the pitch of the screw-thread of the shaft and of the grooves upon the cylinder being the same; and suitable means for clamping the end of a rod to the cylinder.

608,176. CAR-COUPLING. HENRY M. COX, Linden, Cal., assignor to the International Automatic Car-Coupler Company, San Joaquin County, Cal. Filed Nov. 13, 1897. Serial No. 658,490. (No model.)

Claim.—1. A car-coupler having a socketed head with vertical apertures therethrough, a slotted sliding plate on top of the head provided with a sleeve and which normally projects beyond the front face of the head, a coupling-pin supported in said sleeve with its lower end resting on the solid part of the head for automatic coupling, a wedge-shaped link and a vertical bolt passed through the head link and sliding plate, substantially as described.

2. A car-coupler having a socketed head with vertical apertures therethrough, a slotted sliding plate on top of the head provided with a sleeve and which projects normally beyond the front face of the head, a spring between the head of the sliding plate and a shoulder on the socketed head, a coupling-pin supported in said socket-sleeve with its lower end resting on the solid part of the head for automatic coupling, a wedge-shaped link, and an independent bolt which is passed through the head, link and the slot in the sliding plate, substantially as described.

3. A car-coupler having a socketed head with vertical apertures therethrough, a slotted sliding plate which normally projects beyond the front face of the head, a rod or bar on the head of the plate, a spring surrounding said rod and resting against a shoulder on the head, a sleeve on the sliding plate, a coupling-pin supported in said sleeve with its lower end resting on the solid part of the head for automatic coupling, a wedge-shaped link, and an independent bolt which is passed through the head, link and slot in the sliding plate, substantially as and for the purposes described.

608,177. BICYCLE HANDLE-BAR. EDWARD R. CROCKER, McKenzie, Tenn. Filed Aug. 31, 1897. Serial No. 650,107. (No model.)

Claim.—1. The combination with a bicycle-head, of a suitable casing mounted on the same, two intermeshing handle-bar sections pivotally mounted in said casing, a spring-pressed locking-pawl engaging one of said sections, an operating-handle pivoted on one of said sections, a bell-crank lever engaging said locking-pawl for operating the same, and means connecting said bell-crank lever and the operating-handle, substantially as described.

2. The combination of a bicycle-head, a suitable casing mounted on the same, two intermeshing handle-bar sections pivotally mounted in said casing, one of them provided with a plurality of openings, a spring-pressed locking-pawl attached to the casing opposite the section having openings, an operating-handle pivoted to the opposing handle-bar section, and intermediate connections between the operating-handle and pawl, substantially as described.

608,178. WRENCH. MERRITT H. COREY, North Pomona, Cal. Filed July 26, 1897. Serial No. 645,981. (No model.)

Claim.—1. A wheel-nut wrench, comprising a body having its forward end recessed for the reception of a nut and provided with longitudinal grooves, and levers fulcrumed to said body and adapted to fit within said grooves so that their outer surfaces may lie flush with the outer surface of said body, as and for the purpose set forth.

2. A wheel-nut wrench, comprising a body having its forward end recessed for the reception of a nut and provided with longitudinal grooves, levers fulcrumed to said body and adapted to fit within said grooves, so that their outer surfaces may lie flush with the outer surface of the body, and means for locking said levers, one to the other.

3. A wrench of the character described comprising a suitable body having a recess in the end thereof adapted to fit over the nut, and having longitudinal grooves therein, levers pivoted in said grooves, and provided at their forward ends upon the upper sides thereof with roughened surfaces adapted to engage the inner periphery of the rim of the hub when the levers are compressed, a plate secured to one lever and provided with a slot, a screw-threaded pin on the other lever adapted to pass through said slot, and a turn-button upon said pin adapted to be brought in close contact with said plate to lock the levers in contact with the hub-rim, substantially as and for the purpose set forth.

4. A wrench of the character described comprising a suitable body provided in its forward end with a recess adapted to engage the nut, said body being provided with longitudinal grooves opening into said recess, levers pivoted in said grooves, and provided at their forward ends with roughened surfaces adapted to engage the periphery of the hub-rim, a slotted plate secured to one lever, an exteriorly-screw-threaded pin secured to the other lever and passing through the slotted plate, said plate being provided with a roughened surface, a washer provided with a roughened under surface adapted to engage the roughened surface of the slotted plate, a turn-button upon said pin adapted to be forced downwardly upon said washer to lock the levers in contact with the inner periphery of the hub-rim, substantially as and for the purpose set forth.

608,179. TOOTH-FILLING. WILLIAM F. DAVISON, Richmond, Va. Filed Nov. 9, 1897. Serial No. 657,931. (No specimens.)

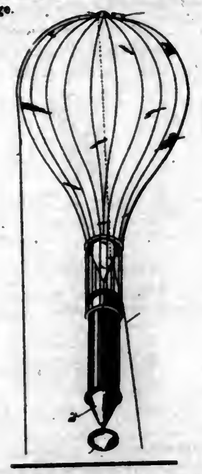
Claim.—A filling composed of cement for its base, strips having an anchorage in said base and gold over the cement and pressed or welded into union with the ends of said strips substantially as described.

608,180. PIPE-HANGER. THOMAS F. DWYER, Brooklyn, N. Y. Filed May 26, 1897. Serial No. 638,279. (No model.)

Claim.—1. The combination of an extensible rod adapted to be inserted between two adjacent beams, a clamp comprising two members, said members when secured together forming serrated passages between them through which the rod is adapted to extend, the opposite end of the clamping members forming a passage between them which extends at right angles to the first-named passage and in which the drop-pipe is adapted to be secured, and means for securing said members together, substantially as described.

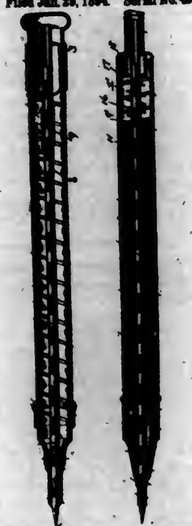
2. The combination of an extensible rod adapted to be secured between two adjacent beams, a clamp comprising two members forming between them a passage when united, through which passage the rod is adapted to extend, said clamping members also forming at their opposite end a passage extending at right angles to the first-named passage for receiving and supporting the drop-pipe, a strip or plate secured to one of said clamping members and extending across the opposite member and having its extremity turned at right angles for the purpose of preventing the separation of said clamping members when united, and means for securing the clamping members together and in position upon the rod, substantially as described.

608,181. FURNACE-BLAST APPARATUS. JOHN A. FARRELL and WALTER DOUGLAS, Morenci, Ariz. Filed Nov. 12, 1897. Serial No. 658,352. (No model.)



Claim.—1. In blast-furnaces, the combination with a furnace provided with a twyer-duct in its side wall, of a wind-chest having a peep-orifice in line with the duct, and a gravity-valve governing said orifice and consisting of a pivoted arm and a ball-valve mounted to freely rotate on an axis carried by said arm, substantially as described.

2. In blast-furnaces, the combination with the furnace provided in its wall with a twyer-duct, of a wind-chest having an orifice in its outer wall in line with said duct, and a valve device governing said orifice comprising a yoke, provided with an arm pivoted on the inner side of said wind-chest wall, and a ball-valve loosely mounted on an axis fixed in the arms of the yoke, said valve device being adapted to open inwardly to permit of a bar being inserted within the orifice and thrust through the twyer-duct into the furnace, and to close automatically by gravity upon the removal of said bar, substantially as described.



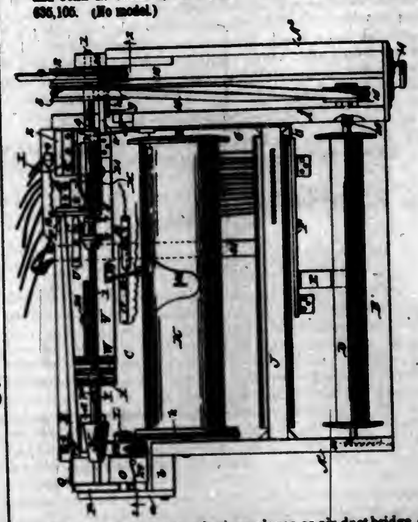
608,182. BALLOON-TORPEDO. MARSELLUS FRENCH, Houston, Va. Filed July 13, 1897. Serial No. 644,420. (No model.)

Claim.—An apparatus for delivering torpedoes to a point of attack, which consists in the combination of a balloon, a torpedo, supporting means between said balloon and said torpedo, an explosive

charge or disruptive member for destroying the balloon, and means for igniting the charge.

608,188. MAGAZINE LEAD-PENCIL. BYRON R. GOLDSMITH, New York, N. Y. Filed Jan. 29, 1894. Serial No. 498,347. (No model.)

Claim.—1. A lead-pencil comprising a mantle provided with a helical guide, a magazine carried by the mantle and adapted to receive a series of marking-points, and means actuated by the helix on the mantle for positively ejecting and renewing the points, substantially as described.



2. A lead-pencil provided with a magazine adapted to receive a series of marking-points, an ejector exterior to the magazine and provided with one or more spring-fingers entering the magazine, and a screw-feed for actuating the ejecting mechanism to positively expel and renew the points, substantially as described.

3. A lead pencil comprising a mantle provided with a helical guide, a magazine adapted to receive a series of marking-points, and an ejector engaged by the helical guide on the mantle, whereby the ejector may be actuated to positively expel and renew the points, substantially as described.

4. A lead-pencil comprising a mantle provided with a helical guide, a magazine adapted to receive a series of marking-points and having spring-jaws at its forward end, and an ejector engaged by the helical guide on the mantle and actuated thereby to positively expel and renew the points, substantially as described.

5. A lead-pencil comprising a mantle with an interior helical guide, a magazine adapted to receive a series of marking-points, and an ejector traveling on the magazine, and engaged by the helical guide, and having a stroke sufficient to expel and renew a number of points in succession, substantially as described.

608,184. ELECTROPNEUMATIC PIANO-PLAYER. FRED B. GOELMAN, Los Angeles, Cal., assignor of three-fourths to John Weber and John H. Goelman, same place. Filed May 5, 1897. Serial No. 636,105. (No model.)

Claim.—1. In an automatic piano-player, an air-duct bridge, comprising a block channeled with parallel air-ducts, each duct having a lateral opening terminating in an enlarged recess covered by a flexible diaphragm, and electrical contact-points arranged outside the diaphragm and adapted to be brought into electrical connection by the bulging or lateral movement of the diaphragm from pneumatic action substantially as described.

2. In an automatic piano-player, an air-duct bridge comprising a block channeled with parallel air-ducts, each duct having a lateral opening terminating in an enlarged recess covered by a flexible diaphragm, and also an independent lateral vent-opening, electrical contact-points arranged outside the diaphragm and adapted to be closed by the movement of the diaphragm from pneumatic action, and an inclosing board or casing covering said electrical contacts and also the lateral vent-holes of the channels, substantially as and for the purpose described.

3. In an automatic piano-player, an air-duct bridge comprising a block channeled with parallel air-ducts, each duct having a lateral opening w^3 terminating in an enlarged recess 37 covered by a flexible diaphragm 39 and also a vent-opening 72, contact-springs 38 pressing on the diaphragm, metal contact-frame 73, and an inclosing casing 43, substantially as and for the purpose described.

4. In an automatic piano-player, an air-duct bridge comprising a block channeled with parallel air-ducts and having on each side lateral openings terminating in enlarged recesses covered by flexible diaphragms, electrical contact-points arranged outside the diaphragms on each side, and arranged to be closed by them, an inclosing-case board 43 for each side, and communicating equalizing-pipe 42 for connecting the chambers on opposite sides of the channeled block substantially as shown and described.

5. In an automatic piano-playing device, the combination with the music-drums, and air-duct bridge, of a supporting-frame composed of bottom B and end boards A' A^3 A^5, the boards A^3 and A^5 forming an end chamber beyond the music-drums, a regulating-shaft with operating-knob and a rerolling-belt both extending through this end chamber to the back and combined with mechanism for operating the music-drums substantially as and for the purpose described.

6. In an automatic piano-playing device, the combination with the music-drums and air-duct bridge, of a main drive-shaft 1 arranged parallel with the drums and behind them, and having drive-pulley 2, sleeve 4 with rerolling-pulley 3 at one end and clutch mechanism for the shaft at the other, sleeve Y with collar X and cone-pulley N all connected to revolve with but slide on said shaft, gears connecting the cone-pulley to the winding-drum, a rerolling-pulley 15 and belt 16 for the music-roll, and a shifting device for the two sleeves substantially as shown and described.

7. The combination with the perforated music-sheet, of the tilting board F hinged at its lower end and carrying at its upper end the tripping-hook E adapted to engage with the perforated music-sheet, the thrust-bar G attached to the tilting board and extending back to the rear end of the device and arranged to operate on the music-roll-reversing mechanism, whereby the positive dragging action of the music-sheet is made to reverse the music-roll at any point along the music substantially as described.

8. In an automatic piano-playing device, the combination with the music-drums and air-duct bridge, of the main shaft 1 having drive-pulley 2, the sleeve 4 with pulley 3 on one end and clutch on the other end, shifting arm T for the clutch, latch H for the shifting arm, the sleeve Y with collar X and cone-pulley N all sliding on shaft 1 but locked to revolve with it; driving-gears connecting the cone-pulley to the winding-drums, the horizontal slide V carrying leg W, finger U, and notch 23, a regulating-shaft 13 for operating this slide, and an electrical switch-arm actuated by the slide, substantially as and for the purpose described.

9. In an automatic piano-playing device, the combination with the main actuating-shaft 1, of the longitudinally-adjustable cone-pulley N, the laterally-adjustable bearing P for the said shaft, the laterally-adjustable block O connected to bearing P by a pivot and spring and carrying the friction-pulley M and pinion L, and the winding-drums with gear k substantially as shown and described.

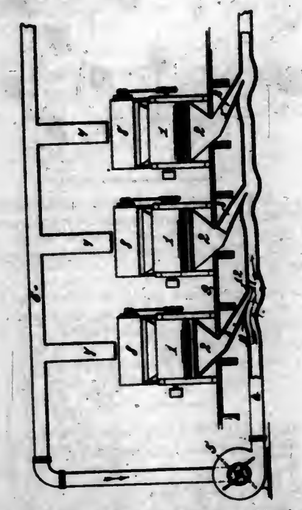
10. In an automatic piano-playing device, the combination of the main shaft 1 having friction cone-pulley N, the adjustable block O carrying friction-pulley M and gear L, the music-roll K with gears k, the bearing P pivoted to block O and carrying one end of the shaft 1, the lug r, springs Q, and s, rod R with inclined end bearing against the lug, and the hinged shifting arm T, for disengaging the rotating gears L k to allow the winding-drum to rotate backward during the rerolling of the music substantially as set forth.

11. In an automatic piano-playing device, the combination with the music-drums, the air-duct bridge, and the actuating devices for the drums as described, of means for rerolling the music at any point before the completion of the piece, comprising a reversing mechanism, a regulating-knob 14 and rod 13 with pin h, double crank g operated upon by said pin by an extreme adjustment of the rod, the tripping-rod G arranged to be lifted by said crank, and the releasing-latch H arranged to be lifted by the rod G for unlocking the clutch of the reversing mechanism substantially as shown and described.

12. The music-drawer of the piano-playing device having in one end a bearing composed of a plate 33 with flanged and curled bearing 34 and pivoted spring-latch 35, and having at the other end a short shaft 25 with revolving pulley and clutch connection for the music-roll drum as shown and described.

13. In a piano-playing device, the pneumatic and its chamber, comprising a valve-board 45, rabbeted frame 46 with air-duct 47 opening through its top, pneumatic-boards 49 bearing bellows B^2 and air-duct 50 and secured in the rabbet of the frame 46 substantially as shown and described.

14. In a piano-playing device the pneumatic, its chamber and valve, comprising a valve-board 45, rabbeted frame 46 with air-duct 47 opening through its top, pneumatic-boards 49 bearing bellows B^2 and air-duct 50 secured in the rabbet of the frame, valve 71 with armature back closing the air-duct 47 and resting on top of frame 46, and the electromagnet 70 operating upon said valve substantially as shown and described.



15. In a piano-playing device, the pneumatic, comprising board 49 with bellows on one side, an open channel 50 on the other side communicating with said bellows, and a separate closing-strip p^2 applied to the back of board 49 to close in channel 50 and having a vent-hole 75 through the same substantially as and for the purpose described.

16. In a piano-playing device, the construction and arrangement of the pneumatic its chambers and valves, consisting of valve-board 45, with holes through it rabbeted frame 46 with air-ducts 47 opening through the top pneumatics secured in the rabbets and communicating with said air-ducts, and valves B^2 placed upon the opposite side of the valve board and having pins 76 extending through the holes in the valve-board to contact with the pneumatics substantially as and for the purpose described.

17. In a pneumatic piano-playing device, the combination with the upright stanchions in the back of an upright piano, of a wind-chest 53, 54, 55 arranged between said stanchions flush with the backs of the same, pumping-bellows arranged therein and provided with compressing-springs 56 and pulleys, and distending-cords for the bellows passing around said pulleys and connecting with driving mechanism and working noiselessly substantially as described.

608,185. COTTON-SEED CONVEYER. HENRY W. GRADY, Dallas, Tex. Filed Aug. 19, 1897. Serial No. 648,813. (No model.)

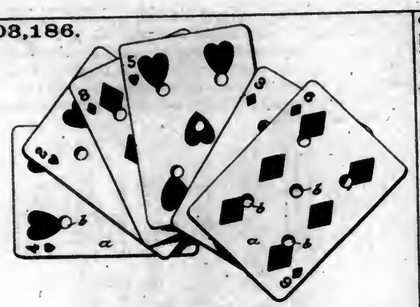
Claim.—1. In a cotton-seed-conveyer system, the combination with a gin or lister, a fan, a seed-hopper to receive the separated seed from the gin, and a seed-chute leading from said hopper, of a horizontally-arranged seed-conveyer flue connected with the fan and with the seed-chute and having its bottom longitudinally arched adjacent to the seed-chute, the cross-sectional area of said flue being nowhere less than that of the discharge-opening from the fan, substantially as described.

2. In a cotton-seed-conveyer system, the combination with a gin or lister, a fan, a seed-hopper to receive the separated seed from the gin, and a seed-chute leading from said hopper, of a seed-conveyer flue connected with the fan and with the seed-chute, the said flue having its top longitudinally arched immediately in rear of the point where it connects with the seed-chute and provided in the bottom with an inverted arch arranged beneath the seed-chute outlet and extended longitudinally in advance of the same, substantially as described.

3. In a cotton seed-conveyer system, the combination with a gin or lister, a fan, a seed-hopper to receive the separated seed from the gin, and a seed-chute leading from said hopper, of a seed-conveyer flue connected with the fan and with the seed-chute, the said flue having both its top and bottom correspondingly arched in a longitudinal direction immediately in rear of the point where the flue connects with the seed-chute and provided in the bottom with an inverted arch arranged beneath and extended longitudinally in advance of the seed-chute outlet, substantially as described.

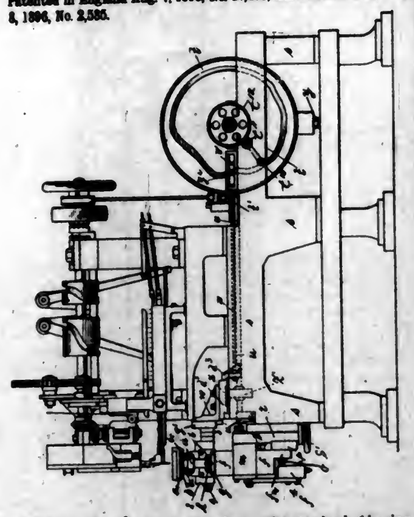
4. In a cotton-seed-conveyer system, the combination with a gin or lister, a fan, a seed-hopper to receive the separated seed from the gin, and a forwardly-inclined seed-chute leading from said hopper, of a seed-conveyer flue connected with the fan and with the seed-chute outlet, the said flue being longitudinally arched immediately in rear of the point where it connects with the seed-chute and having its bottom provided with an inverted arch beneath and in advance of the seed-chute outlet, substantially as described.

5. In a cotton-seed-conveyer system, the combination with a gin or lister, a fan, a seed-hopper to receive the separated seed from the gin, and a seed-chute leading from said hopper, of a seed-conveyer flue connected with the fan and with the seed-chute outlet and provided in its bottom with an inverted arch arranged longitudinally beneath and in advance of the seed-chute outlet, substantially as described.



608,186. PLAYING-CARD. HENRY I. GRIFFIN, New Paltz, N. Y., assignor of one-half to Jacob Dayo, same place. Filed Mar. 20, 1897. Serial No. 628,002. (No specimens.)

Claim.—1. A playing-card provided with a plurality of transverse apertures through its body to admit the circulation of air, said apertures being arranged at the four corners of a quadrangle with one aperture in the middle thereof, substantially as described.



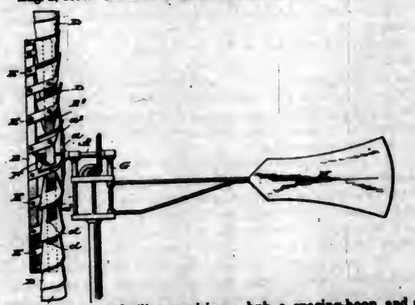
2. A set of playing-cards in which each individual member is provided with a plurality of regularly-disposed ventilating holes through its body, substantially as described.

3. A playing-card having a plurality of ventilating-holes distributed through its body portion, substantially as described.

608,186.

608,187. WORK-HOLDER FOR BRUSH-MACHINES. HUGO GROSMANN, Sobernheim, Germany, assignor to Carl Eduard Flemming, same place. Filed Dec. 10, 1896. Serial No. 615,295. (No model.) Patented in England Aug. 7, 1896, No. 17,491, and in Luxemburg Aug. 8, 1896, No. 2,585.

Claim.—1. In combination the frame, the standard *f* having a forked upper end, the transverse slide, the pin 3 and block 2 forming the connection between the slide and the upper forked end of the standard, the work-table, the forked block 6 depending therefrom into the forked end of the standard and engaging a portion of the block 2, the brackets *b* depending from the work-table alongside the standard, the slotted guides engaging the said brackets, the pivoted guide-block, the slotted guide for the standard *f*, and a second slide carrying the transverse slide with means for operating said slides, substantially as described.



2. In combination the work-table, the swinging standard, the connection between the standard and table comprising the sliding block 2 in the standard, the table pivotally connected to the standard and engaging the block, the pin 3 engaging the block 2 and means for moving the pin longitudinally and laterally, substantially as described.

3. In combination, the standard carrying the work-table, the sliding and pivotal connection *m* for the standard to allow it to have vertical movement as it swings, the slotted guide-plate receiving a roller from the standard, and a vertically-adjustable support for the slotted guide-plate, said adjustable support carrying also the pivotal connection *m*, substantially as described.

4. In combination the work-table, the standard *f* carrying the same, the pivoted guide-block *m* through which the standard may slide, the slotted guide to cause the standard to have vertical sliding movement as it swings, and the spring-box having a bolt for pressing the standard upwardly to relieve pressure on the slotted guide-plate, the said spring-box being suspended from the pivoted guide-block to oscillate with the standard, substantially as described.

5. In combination the pivoted work-table, the pivoted standard carrying the same the slides $d^{\times}$, and d^{3}, for moving the said parts on their pivots, the grooved disk *t*, the gearing operated thereby and connected to the slide d^{4}, for operating the same, said gearing comprising an exchangeable portion, and the connections from the disk to the slide d^{3}, comprising an adjustable lever whereby the traverse of the slides may be changed to suit different brush-boards, substantially as described.

608,188. WINDMILL. NICHOLAS HEIN, Clifton, Wis. Filed Aug. 2, 1897. Serial No. 646,800. (No model.)

Claim.—A windmill comprising a hub, a spacing-hoop, and an outer stationary hoop rigid with relation to the hub, a rotatable hoop arranged in horizontal alinement with the outer hoop, blades loosely supported from the spacing-hoop and having slots through which the stationary hoop passes, links secured to the two outer hoops and to the blades, springs connecting the said hoops, bolts carried by the inner ends of the blades and passing through openings in the spacing-hoop, springs on the bolts, and nuts for placing the springs under tension, substantially as described.

608,189. MOTOR-GOVERNOR. MARTIN H. HERSHEY and BENJAMIN T. ALLEN, Harrisburg, Pa.; said Allen assignor to said Hershey. Filed June 1, 1897. Serial No. 638,607. (No model.)

Claim.—1. In an engine-governor, the combination with the rotary carrier and eccentric, of the governor-levers pivotally mounted on the carrier at diametrically opposite points, each of said levers extending on opposite sides of its pivot and having its opposite ends weighted, the mass of each of the levers and weights being so disposed that the center of gravity is at a point in alinement between the weights on opposite ends of the lever, within the path described by the pivotal center of the lever and to the forward side of a line intersecting said center and the axis of rotation of the carrier, and a connection between each of said levers and eccentric; substantially as described.

2. In a governor, the combination with the rotary carrier and eccentric, of the substantially straight governor-levers pivotally mounted on said carrier at diametrically opposite points, each of said levers extending on opposite sides of a line intersecting the axis of the carrier and lever pivot and each having its leading end provided with a major weight and its trailing end projecting and operating outside of the path traversed by the pivotal center of the lever and provided with a minor weight, the disposition of the mass of the lever being such that the center of gravity lies within the path described by the lever-pivot and forward of a line intersecting the pivot and axis of the carrier and a connection between the lever and eccentric; substantially as described.

3. In a governor, the combination with the rotary carrier and eccentric, of a governor-lever pivotally mounted on said carrier and extended on opposite sides of its pivot, the mass of said lever being so disposed that the center of gravity is located to one side of said pivot whereby the lever is acted on by centrifugal force and independent detachable differential weights adapted to be secured to opposite ends of said lever, whereby the weight of the lever may be increased at its extremities without shifting the position of the center of gravity; substantially as described.

4. In a governor, the combination with the rotary carrier and eccentric pivotally mounted thereon, of the governor-levers pivotally mounted on said carrier at diametrically opposite points, removable weights with means for attaching said weights to opposite ends of the levers, the proportions of said weights being such that the center of gravity of the levers is not changed by their attachment, links connecting the levers and eccentric and contrapotally-acting springs for holding the levers in normal position; substantially as described.

608,190. AUTOMATIC DUST-GUARD FOR TRAIN-PIPE COUPLINGS. MICHAEL J. HOEY, Columbus, Ohio. Filed Nov. 6, 1897. Serial No. 657,980. (No model.)

Claim.—1. In a train-pipe coupling, the combination with the half-coupling, of a collar provided with means for attachment to the pipe-section, a lever pivoted intermediate its ends to said collar and provided with a hood or cap arranged to cover the open end of said half-coupling, a housing provided on said collar, and a leaf-spring connected at one end to said lever and having its free end slidably supported within said housing, substantially as described.

2. In a train-pipe coupling, the combination with the half-coupling, of a collar provided with means for attachment to the pipe-section, a lever pivoted intermediate its ends to said collar and provided with a hood or cap arranged to fit over the open end of said half-coupling, and a spring comprising a plurality of resilient leaves rigidly attached at one end to said lever and having a movable bearing upon a support carried by the said collar, substantially as described.

608,191. RAIL-JOINT. FREDERICK V. JARDEN, Philadelphia, Pa. Filed Sept. 22, 1897. Serial No. 652,547. (No model.)

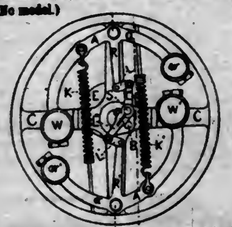
Claim.—1. A joint for the meeting ends of railway-rails comprising fish-plates interchangeable with each other and having depending portions with apertures therein having their lower faces on the same horizontal plane, a wedge-plate having beveled projecting members forming wedges adapted to enter the apertures in the depending portions of the fish-plates, and likewise having their acting faces in the same horizontal plane, and means for moving said wedge-plate laterally.

2. A joint for the meeting ends of railway-rails comprising fish-plates interchangeable with each other and having portions extending below the base of the rails with apertures therein having their lower faces in the same horizontal plane, a wedge-plate having beveled projecting members forming wedges adapted to said apertures and likewise having their acting faces in the same horizontal plane, with a bolt or bolts formed integral with the wedge-plate and a nut or nuts adapted thereto, whereby the wedge-plate may be moved laterally.

3. The combination of the rails, fish-plates therefor, a wedge-plate mounted under the rails, said wedge-plate having beveled projections at each side bearing on the fish-plates, and a bolt carried by the wedge-plate above the bearing-point, with a nut adapted thereto for moving the wedge-plate laterally, substantially as described.

4. As a new article of manufacture, a wedge-plate for the meeting ends of railway-rails consisting of a body having on each side one or more projecting members beveled on the under side, forming wedges, and having their acting faces in the same horizontal plane.

5. A joint for the meeting ends of railway-rails, comprising the fish-plates, and securing devices for holding said fish-plates to the rails, said securing devices comprising bolts and nuts with suitable nut-locks, the seats for the bolt-heads and nut-locks having portions of their faces formed in different planes, the bolt-heads and nut-locks fitting the same, whereby any rotative movement of the bolt is prevented.



6. As a new article of manufacture, a nut-lock comprising an annular ring of spring metal having a single plane surface on one side of the same, and the other side composed of a number of surfaces offset from each other and in different planes.

608,192. HOISTING APPARATUS. ROBERT JOHNSTON, River Falls, Wis. Filed Mar. 26, 1897. Serial No. 629,401. (No model.)

Claim.—The combination with a mast or other supporting device, of a power mechanism embracing independent winding-shafts and a power-shaft common to both shafts and with shifting mechanism, a track-cable attached at one end to the mast or supporting device and at its other end to one of the winding-shafts, a carriage, and a haulage-cable attached at one end to the supporting device, thence running through sheaves on the carriage and supporting device, and connected to the other winding-shaft, substantially as described.

608,193. GOVERNOR FOR STEAM-ENGINES OR OTHER MOTORS. ERWIN C. KRAFT, Syracuse, N. Y. Filed July 8, 1896. Serial No. 598,403. (No model.)

Claim.—1. In a governor, the combination with the rotary carrier, and the governor-levers pivotally mounted at diametrically opposite points on said carrier, said governor-levers being each extended on opposite sides of its pivot and weighted at both ends, of the controlling-eccentric pivotally mounted on the carrier independent of the governor-levers and with a connection between said eccentric and the governor-levers; substantially as described.

2. In a governor, the combination with the rotary carrier and the governor-levers pivotally mounted on said carrier at diametrically opposite points each of said governor-levers extending on opposite sides of its pivot and having its opposite ends weighted, the arrangement being such that as said levers swing on their pivots the weights or centers of gravity of said levers are caused to move in diametrically opposite directions, thereby maintaining the balance of the governor-levers about the axis of the carrier, of an eccentric pivotally mounted on said carrier independently of the levers and a connection between said eccentric at a point diametrically opposite its center of oscillation and the governor-levers; substantially as described.

3. In a shaft-governor the combination of a rotary carrier, a pair of principal swinging centrifugal weights pivoted thereon at diametrically opposite points, a pair of secondary centrifugal weights, rigidly attached one to each of said principal weights and adapted to centrifugally oppose them, springs adapted to resist the resultant centrifugal action of said weights, and flexible connections to transmit the swing of said weights to the valve or controller operating mechanism.

4. In a shaft-governor the combination of a rotary carrier, an eccentric-pivot thereon, a pair of principal swinging centrifugal weights also pivoted thereon at diametrically opposite points, a pair of secondary centrifugal weights rigidly attached one to each of said principal weights on the opposite side of each pivot and adapted to centrifugally oppose them, springs adapted to resist the resultant centrifugal action of said weights, and flexible connections to transmit the swing of said weights to said eccentric.

5. In a governor, the combination with the rotary carrier and eccentric, of the governor-levers pivotally mounted on said carrier at

diametrically opposite points, each of said levers extending on opposite sides of its pivot and having its opposite ends weighted, the mass of each of the governor-levers being so disposed that the center of gravity lies within the path described by the pivotal center of the lever and to one side of a line intersecting said center and the axis of rotation of the carrier and a connection between each of said governor-levers and the eccentric; substantially as described.

6. In a governor, the combination with the rotary carrier and eccentric pivotally mounted thereon and oscillating transversely of the axis of the carrier, of independent governor-levers pivotally mounted on said carrier at diametrically opposite points, each of said governor-levers extending on opposite sides of its pivot and having its ends weighted, the disposition of the mass of each of said levers being such that the center of gravity is located to one side of a line intersecting the pivot of the lever and the axis of the carrier, and within the path described by the pivot of the lever in its traverse about the said axis, and a link connecting each of said levers and the eccentric; substantially as described.

7. In a governor, the combination with the rotary carrier and eccentric pivotally mounted on said carrier to move transversely of the axis of said carrier, of the governor-levers pivotally mounted on the carrier at diametrically opposite points, each of said levers extending on opposite sides of its pivot and the mass of each of said levers being so disposed that the center of gravity lies within the path of the pivot in its traverse around the axis of the carrier and to one side of a line intersecting the said pivot and axis and a contripetally-acting spring connecting each of said levers and the carrier; substantially as described.

8. In a governor the combination with a rotary carrier, of weight-supporting arms mounted thereon upon diametrically opposite pivots, unequal weights upon the free ends of each of said arms arranged so that the greater weight on one arm is opposite to the lesser weight upon the other, counteracting springs connected to said carrier and to said arms between their greater weights and their pivots, and an eccentric to which both arms are connected at a common point.

9. In a governor the combination with a rotary carrier, of swinging arms mounted upon diametrically opposite pivots at points intermediate their length at unequal distances from their extremities, a greater weight upon longer end of each arm, a lesser weight upon the shorter end of each, said weights being arranged so that the greater weight on each arm is opposite to the lesser weight on each arm, whereby said weights are substantially counterbalanced, force-counteracting springs connected to said arms between their greater weights and their pivots, an eccentric and means to connect both arms to it at a common point.

608,194. WRENCH. WILLIAM F. LAWLER, Anderson, Ind. Filed Feb. 11, 1897. Serial No. 623,008. (No model.)

Claim.—1. The herein-described improved wrench, comprising a shank having a chamber therein, a spring-pressed rack-bar located in said chamber, an upper jaw secured to the end of said shank and engaging one end of said rack-bar, and a movable jaw working on said shank, as set forth.

2. The herein-described improved wrench, comprising a shank having a chamber therein provided with an overhanging flange, a spring-pressed rack-bar having one end in engagement with said flange, an upper jaw secured to said shank and engaging the other end of said rack-bar, and a movable jaw working on said shank, as set forth.

3. The herein-described improved wrench, comprising a shank having a chamber therein provided with an overhanging flange, a rack-bar having reduced ends, one of which is in engagement with said flange, a spring in said chamber bearing against said rack-bar, an upper jaw secured to said shank and having a recess therein adapted to receive the other end of said shank, and a movable jaw working on said shank, substantially as set forth.

4. The herein-described improved wrench, comprising a shank having a chamber therein, a spring-pressed rack-bar located in said chamber, an upper jaw secured to the end of said shank and engaging one end of said rack-bar, and a movable jaw working on said shank and having an inclined groove adapted to receive said rack-bar, as set forth.

5. The combination with a wrench having recesses in its jaws, of a ring or body portion having opposite pins or lugs adapted to enter said recesses, side plates removably secured to said ring or body portion, a circular member mounted between said side plates and provided with peripheral teeth and a central opening, and a spring-pressed pawl mounted in said ring or body portion and engaging said teeth, substantially as set forth.

608,195. PROCESS OF PURIFYING ORTHOTOLUENESULFO-CHLORID. WILHELM MAJERT, Grunau-Berlin, Germany. Filed Mar. 27, 1897. Serial No. 629,515. (No specimens.)

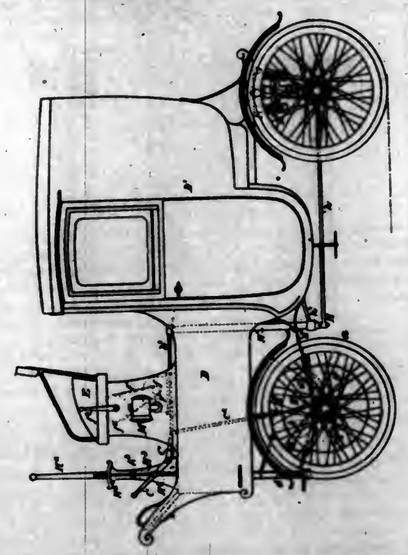
Claim.—The process of separating orthotoluenesulfo-chlorid from a mixture of ortho and para toluenesulfo-chlorid, consisting in distilling out a quantity of orthotoluenesulfo-chlorid, cooling the residue to crystallize out paratoluenesulfo-chlorid, separating the crystals from the liquid and subjecting the latter to distillation, substantially as described.

608,196. THILL COUPLING-BOLT. ADDISON G. MAY, St. Charles, Mo. Filed June 9, 1897. Serial No. 640,043. (No model.)

Claim.—1. A coupling pin or bolt, in combination with a spring secured at one end to said pin and at the other to a cup engaging the other end of the pin, said spring being adapted to stride the parts coupled by said pin, substantially as described.

2. The combination with a coupling pin, of a spring secured at one end to the head of the pin, a cup secured to the other end of said spring to receive the point or free end of the pin, and a washer on the pin intermediate the axle-clip and the open end of the cup, adapting the latter to secure the pin in place and also to serve as a lubricating cup, substantially as described.

608,197. PAPER-MAKING MACHINE. SEBASTIAN H. MILLER, Piedmont, W. Va. Filed June 3, 1897. Serial No. 639,326. (No model.)



Claim.—1. The improvement in paper-machines herein described comprising the combination with the top couch-roll of the casing arranged above the top couch-roll and having in its under side a recess opening toward said roll and open at the end and unobstructed at each end whereby the guard-board strip may be inserted in and removed endwise from said casing, the guard-board strip, the pressure-screws engaging said strip, and a support for the said casing, which support forms no obstruction to the open end of the casing substantially as described.

2. The herein-described improvement in paper-machines consisting of the top couch-roll, the beam extending longitudinally above the said roll, the casing having in its under side a recess opening toward said roll and open at the end and unobstructed at each end whereby the guard-board strip may be inserted in and removed endwise from said casing, the guard-board strip, the pressure-screws engaging said strip, and fastenings securing said casing, at close intervals to the beam whereby to prevent any springing of the casing toward or from the roll and whereby the casing is secured in such manner that its open end is left unobstructed for the endwise insertion and removal of the guard-board strip substantially as shown and described.

3. The improvement in paper-machines herein described comprising the top couch-roll, the beam extended above said roll in the direction of length thereof, the casing having in its under side a recess open toward the top couch-roll and open at its end, said casing being provided in its top with openings for the set-screws and having above said recess and between the set-screw openings transverse holes for the fastening-bolts, the fastening-bolts securing the casing to the beam and passed through said transverse openings in the casing whereby the casing is secured at close intervals and its end is left unobstructed, and the guard-board strip and set-screws substantially as shown and described.

608,198. ELECTRICALLY-PROPELLED VEHICLE. HENRY G. MORRIS and PEDRO G. SALOM, Philadelphia, Pa. Filed Sept. 20, 1896. Serial No. 607,344. (No model.)

Claim.—1. The combination in an electrically-propelled vehicle, of a front axle, motor mounted thereon, a forward structure forming part of the vehicle-body and located directly above the front axle and carrying the battery, a rear axle, a carriage or wagon body trailing from the front structure and mounted upon the rear axle, substantially as described.

2. The combination in an electrically-propelled vehicle, of a front axle, its wheels, a motor mounted on the front axle, a rear axle, wheels thereon, a battery-carrying structure located directly above the front axle, a body mounted upon the rear axle and connected to the said battery-carrying structure, the motors being geared to the front wheels, and steering mechanism connected to the rear wheels, substantially as described.

3. The combination in an electrically-propelled vehicle, of a front axle, two independent wheels thereon, two motors on the axle, one motor geared to one wheel and the other motor geared to the other wheel, a rear axle, wheels thereon, a battery-carrying structure mounted above the front axle and motors carried thereby, and a body attached to the said structure and supported by the rear axle, with steering mechanism, substantially as described.

4. The combination in an electrically-propelled vehicle, of a front axle, its wheels, motors on the front axle, one motor geared to one wheel and the other motor geared to the other wheel, springs mounted on the axle, a battery-holding structure mounted above the front axle and supported by the springs, a rear axle and its wheels, springs carried thereby and a body attached to the battery-carrying structure and mounted on the springs of the rear axle, substantially as described.

5. The combination in an electrically-propelled vehicle, of a front axle, its wheels, an internal gear mounted on each wheel, two motors mounted on the front axle and having pinions, the pinion of one motor geared to the internal gear of one wheel and the pinion of the other motor geared to the internal gear of the other wheel, springs on the front axle, a battery-carrying structure mounted on the springs directly over the front axle so that the front wheels will sustain the weight thereof, a rear axle and its wheels and a body attached to the battery-carrying structure at its forward end and carried at the rear by the rear axle, substantially as described.

608,199. CUSPIDOR. HENRY C. MCRAE, Macon, Fla. Filed July 26, 1897. Serial No. 646,209. (No model.)

Claim.—1. A stationary cuspidor comprising the conical circular hopper 1 having ears 7 7, the annular ring 3 having the serrated edge 3', in combination with the vertical discharge-pipe 5 provided with the notched conical flange 6 adapted to engage said ears 7, substantially as shown and described.

2. A stationary cuspidor, comprising the conical circular hopper 1, having ears 7 and ribs 8, in combination with the annular ring-support 3 having serrated edge 3' and inclined edges 9 and the vertical discharge-pipe 5 provided with the notched conical flange 6, substantially as shown and described.

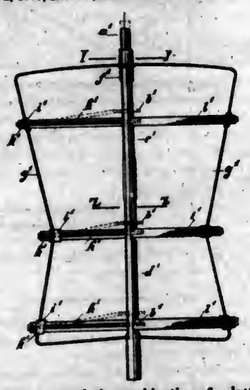
608,200. PROCESS OF EXTRACTING TIN FROM TIN-PLATE WASTE. JULIUS NEUBARE, New York, N. Y. Filed Sept. 10, 1897. Serial No. 651,243. (No specimens.)

Claim.—1. The process of regenerating an alkaline electrolyte charged with salts of tin, which consists in adding phosphoric acid to the electrolyte and, after the reaction which takes place is complete, adding calcium oxid to the electrolyte, substantially as and for the purposes hereinbefore set forth.

2. The herein-described process of recovering tin from tin-waste and the like, which consists in subjecting the tin-waste to the conjoint action of a current of electricity, and a bath consisting of a solution of caustic alkali, until the recovery of the tin is retarded or ceases, and the bath becomes charged with tin salts; then adding phosphoric acid to the bath, causing a precipitation of tin-oxid; then adding calcium oxid to the bath, causing a precipitation of calcium phosphate, and removing the precipitates of such reactions, substantially as and for the purposes hereinbefore set forth.

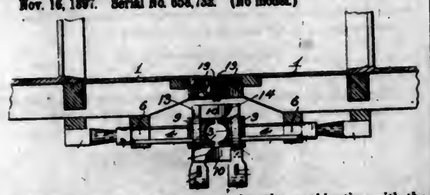
608,201. JEWELER'S STONE-SETTING INSTRUMENT. JOHN A. OWENS, Denham, Tex., assignor of one-half to John C. Saunders, same place. Filed July 22, 1897. Renewed Mar. 29, 1898. Serial No. 675,640. (No model.)

Claim.—1. An instrument for setting jewels or stones in studs and the like, consisting of a base-piece having a pendent, angular neck designed to be held by a vise, or other holder, an axially-rotating carrier journaled to the base-piece, constantly held upright thereby, and having two elastic jaws provided with inwardly-projecting lips for gripping the shank of the stud, or other article of jewelry, and means for operating the jaws, substantially as described.



2. An instrument for setting jewels or stones in studs and the like, consisting of a cylindrical base-piece having a pendent flat-sided neck constructed to be held by a vise, or other holder, an axially-rotating cylindrical carrier having a journal or spindle mounted in the base-piece and two elastic jaws provided with inwardly-projecting lips for gripping the shank of a stud, or other article of jewelry, said carrier being constantly held upright by the base-piece, and a screw for operating the two elastic jaws, substantially as described.

608,202. FASTENER FOR GLOVES. CARL A. PFENNING, Barmen, Germany. Filed Apr. 20, 1897. Serial No. 634,402. (No model.)

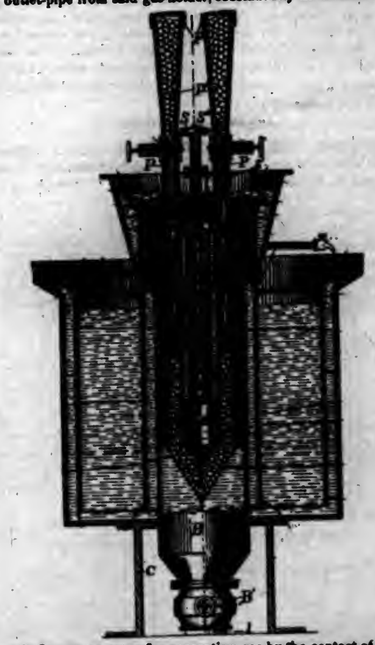


Claim.—A fastening device having two contacting parts, each part formed of two sections adapted to receive fabric between them, one of the sections having prongs adapted to pierce the fabric and to be bent by contact with the opposite section, the sections of the upper fastening part having their edges or circumferences inclined downwardly or toward the lower fastening part, and the sections of the lower fastening part having their edges or circumferences inclined upward or toward the upper fastening part to cause the flaps or cloth secured by the fastening to lie close upon or in contact with one another.

608,208. SHOW-STAND. MAX RAHR, Berlin, Germany. Filed May 31, 1895. Serial No. 551,276. (No model.) Patented in Germany Feb. 22, 1895, No. 87,930; in England Feb. 27, 1895, No. 4,266, and in France Mar. 2, 1895, No. 245,505.

Claim.—In a show-stand, the combination of a slotted tube, with a frame fixed to the slotted tube and having guide-pieces, a rod having pins and adapted to slide in the said slotted tube, pins passing freely through the guide-pieces, elastic strips connected to the outer ends of the pins of the guide-pieces, and links connecting the inner ends of the pins of the guide-pieces with the pins of the sliding rod, substantially as and for the purpose set forth.

608,204. CAR-COUPLING. FRANK R. RAFF, Easton, Pa. Filed Nov. 16, 1897. Serial No. 658,732. (No model.)



Claim.—In an automatic car-coupler, the combination with the hollow draw-bar, the heads at the inner and outer ends, the bearings and plate between which said draw-bar is located, and the pointed block engaging with the head at the inner end of the draw-bar, of the hook journaled on said draw-bar having oppositely-extending beveled lugs at the ends, the weight at the lower end of said hook, and means for actuating said hook to uncouple the cars, substantially as described.

608,205. ACETYLENE-GAS GENERATOR. JOHN M. RAYMOND, and LOUIS H. LESLEY, New Orleans, La., assignors of one-third to William Thomas Coats, same place. Filed Sept. 28, 1897. Serial No. 653,360. (No model.)

Claim.—1. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir within the center of said tank; an elevated reservoir on the outside of said tank; pipes leading from said elevated reservoir to the said reservoir within said tank; a valve in one of said pipes; means operated by the rising and falling of the gas-holder adapted to operate said valve; a receptacle for the gas-generating material carried in said gas holder; a gas-chamber above said receptacle; passages leading to said gas-chamber; a pipe leading from said gas-chamber to the lower portion of the gas holder; and an outlet-pipe from said gas-holder, substantially as described.

2. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir within the center of said tank; an elevated reservoir without said tank; pipes leading from said elevated reservoir to the reservoir within said tank; a valve in one of said pipes; an arm of said valve; a pivoted lever connected to said arm; devices mounted upon the gas-holder adapted to operate said pivoted lever so as to close said valve as the gas-holder rises and to open said valve as said gas holder falls; a receptacle for the gas-generating material carried in said gas-holder; a gas-chamber above said receptacle; passages leading to said gas-chamber; a pipe leading from said gas-chamber to the lower portion of the gas-holder; and an outlet-pipe from said gas-holder, substantially as described.

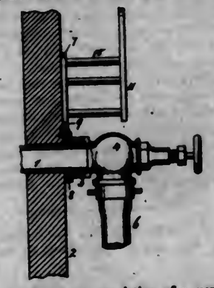
3. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir within said tank; an elevated reservoir without said tank; pipes leading from said elevated reservoir to said reservoir within said tank; a valve in one of said pipes; means operated by the rising and falling of the gas-holder adapted to operate said valve; a receptacle for the gas-generating material carried in said gas-holder; feeding-pipes entering the top of said gas-holder; valves in said pipes; gas-chambers above said receptacle; passages connecting said chambers; a pipe leading from said gas-chamber to the lower portion of the gas-holder; and an outlet-pipe from said gas-holder, substantially as described.

4. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir entering the bottom of said tank; a pipe leading to said liquid-reservoir; a cylinder entering the head of said gas-holder and inclosing said reservoir; another cylinder extending into said reservoir; a head fitting over the tops of both of said cylinders, the inner cylinder having a closed bottom; the carbid-basket mounted upon the bottom of the inner cylinder; feed-pipes leading through said head and the bottom of said inner cylinder to said carbid-basket; valves in said pipes; a gas-chamber in the upper portion of said inner cylinder; pipes leading from above said carbid-basket thereto; an outlet from said gas-chamber to the outer cylinder; a pipe leading from said outer cylinder to the gas-holder; and an outlet-pipe from said gas-holder, substantially as described.

5. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir entering the bottom of said tank; a pipe leading to said liquid-reservoir; a cylinder entering the head of said gas-holder and inclosing said reservoir; a second cylinder extending into said reservoir and having a closed bottom; a head fixed to the top of said inner cylinder and resting upon the top of the outer cylinder; a screw connected to said head and adapted to raise and lower the same; a carbid-basket attached to the bottom of said inner cylinder; carbid-pipes entering the top of said inner cylinder and leading through the bottom thereof above said carbid-basket; a chamber in the bottom of said inner cylinder, and a chamber in the top of said cylinder; pipes connecting said chambers; an outlet from said upper chamber; a pipe leading from said outlet to the gas-holder; and an outlet-pipe from said gas-holder, substantially as described.

6. In an apparatus for generating gas by the contact of a liquid with a solid material, the combination of an outer tank; a gas-holder within said tank; a liquid-reservoir within said tank; an elevated reservoir without said tank; a pipe leading from said elevated reservoir to said reservoir within the tank; a valve in said pipe; devices operated by the rising and falling of the gas-holder adapted to control said valve; a cylinder fixed in the head of said gas-holder and inclosing said reservoir within said tank; a second cylinder extending into said reservoir; a common head for said cylinders, and means for securing the same in place; a carbid-basket mounted beneath said inner cylinder; carbid-pipes extending vertically through said inner cylinder to said carbid-basket; gas-chambers above said basket in said inner cylinder; a pipe leading from said chambers to the gas-holder; and an outlet-pipe for said gas-holder, substantially as described.

608,206. METHOD OF PRODUCING HOLLOW INGOTS. JOHN T. ROWLEY, Beaver Falls, Pa. Filed May 27, 1897. Serial No. 638,355. (No model.)

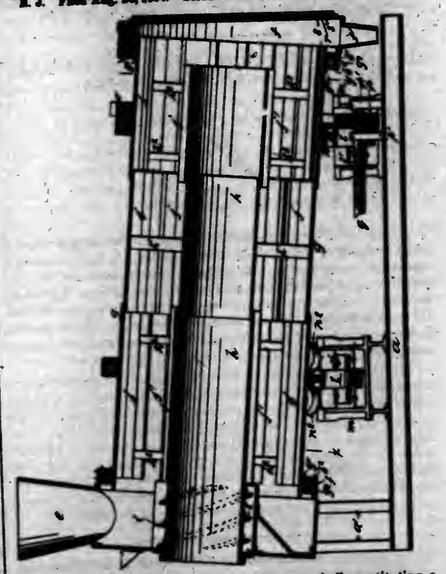


Claim.—1. The herein-described improvement in method for producing hollow ingots from solid bars or billets, which consists of heating the solid ingot, bar, or billet and subjecting the same to the friction or pressure of a plurality of surfaces parallel with the axis of the billet, the billet or bar being free to rotate on its axis and to elongate during the operation, substantially as described.

2. The herein-described improvement in method for producing hollow ingots from solid bars or billets, which consists of heating the bar or billet and subjecting the same to the friction or pressure of a plurality of surfaces, the said surfaces being parallel with the axis of the bar or billet and adapted to progressively increase the reduction of the ingot, the ingot or bar being free to rotate on its axis and to elongate during the operation, substantially as described.

3. The herein-described improvement in method for producing hollow ingots from solid bars or billets, which consists in first heating the solid ingot, subjecting the same to the pressure of a roll and a vertical concave die-plate, the billet or bar being free to rotate on its axis and to elongate during the operation, substantially as described.

608,207. HOSE RACK OR SUPPORT. CHARLES W. REBY, Brooklyn, N. Y. Filed Nov. 9, 1897. Serial No. 657,947. (No model.)



Claim.—1. A hose-support, consisting of a vertical back plate designed to rest against a wall, and having a pendent rigid eye at its lower portion, constructed to engage a water-supply pipe for the hose, a vertical front plate, connecting rods between said front and back plates, means for securing the eye on the water-supply pipe, and means for holding the hose-support and its eye against rotation on the pipe, substantially as and for the purposes described.

2. A hose rack or support comprising a front section, a rear section, and suitably-spaced cross-pieces made to connect the sections, the front section being made to rise above the rear section, and the rear section being dropped below the front section, each depending rear part having an eye or annular seat substantially as described.

3. A pipe threaded for the reception of a nut or valve, and a rack or support adapted to be slipped or coated about such pipe and to be held by such nut, said rack having prongs or holders at its rear face so that the prongs are brought into action as the rack with the nut are moved home substantially as described.

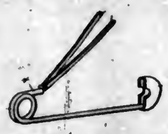
608,208. DRYING APPARATUS. WILLIAM B ROGERS, Bayonne, N. J. Filed Aug. 20, 1897. Serial No. 648,268. (No model.)

Claim.—1. In a drying apparatus, an inner shell constituting a flue or passage for a heated current, mounted concentrically in and communicating at one end with an outer shell; a feed-opening leading to the space between the shells, and a discharge-opening at the opposite end, substantially as described.

2. In a drying apparatus, an inner shell communicating at one end with a source of heat and constituting a continuous flue or conduit for a heated current; an outer shell extending beyond the opposite end of the inner shell and suitably concentrically mounted thereon; an exhaust communicating with the outer shell; a feed-opening directed upon the exterior of the inner shell at one end; a discharge-opening from the outer shell at the opposite end, and means for rotating said shells, substantially as described.

3. A front and a rear stationary head, the latter having a discharge-opening; an inner shell in communication, through the front head, with a suitable source of heat, and not extending to the rear head; an outer shell extending from the rear head to the front head, suitably connected to the inner shell and communicating with a front exhaust; a feed-opening through the front head, through which the material is fed between the shells, and means for rotating the shells, substantially as described.

4. An inner shell constituting a flue or passage for a heated current mounted by rigid and yielding braces concentrically in, and communicating at one end with an outer shell; a feed-opening between the shells, an opposite discharge-opening, and an exhaust communicating with the outer shell, substantially as described.

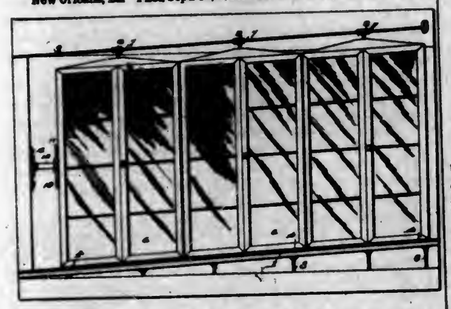


5. An inner shell constituting a flue or passage for a heated current; a spiral conveyer located about the exterior of the forward end of said shell; an outer concentric shell mounted upon the inner shell, and in communication with the latter at the rear thereof; a feed-opening above said conveyer and a stationary box or trough below the same; an opposite discharge-opening; an exhaust communicating with the outer shell and means for rotating said shells, substantially as described.

6. A stationary front head provided with an opening, an internal box or trough below said opening, a feed-chute above the same, and an exhaust; a rear stationary head having a discharge-opening; in combination with an inner shell journaled in the opening in the front head and having a spiral conveyer working in said box or trough; an outer shell extending from the rear head, and in communication at the rear with the inner shell, and at the front with the said exhaust; and means for rotating said shells, substantially as described.

7. A stationary front head provided with an opening; an internal box or trough below said opening; a feed-chute above the same, and an exhaust, a rear stationary head having a discharge-opening and a damper *d*; in combination with an inner shell journaled in the opening in the front head and having a spiral conveyer working in said box or trough; an outer shell extending from the rear head and

in communication at the rear with the inner shell and at the front with said exhaust; rigid and yielding connections between said shells, and means for rotating said shells, substantially as described.



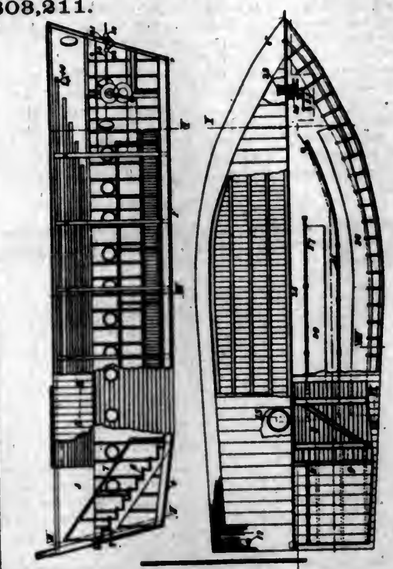
608,209. HAIR-CRIMPER. EDWIN A. SMITH, New York, N. Y. Filed Aug. 23, 1897. Serial No. 649,108. (No model.)

Claim.—1. The herein-described hair-curler constructed substantially in the form of a safety-pin and embodying a body member, a spring-coil at one end thereof, a guard at the opposite end, and two arms or finger pivotally connected to the extremity of the coil by knuckle-joints, the arrangement being such that the fingers will reach the limit of their free pivotal movement before they can be inserted in the guard, whereby the resiliency of the coil maintains the fingers in engagement with the guard, substantially as described.

2. The herein-described hair-curler, constructed substantially in the form of a safety-pin and embodying a body member, a spring-coil at one end thereof having a projecting extremity, a guard at the opposite end, and two independently-movable arms or fingers pivotally connected to the projecting extremity of the coil by knuckle-joints, the arrangement being such that the fingers will reach the limit of their free pivotal movement before they reach the guard, whereby the spring action of the coil is used to maintain the fingers in engagement with the guard, substantially as described.

608,210. TRANSFERABLE SHOW-CASE. JOHN C. SPRAGGINS, New Orleans, La. Filed Sept. 17, 1897. Serial No. 652,047. (No model.)

Claim.—1. In a device of the character described, the combination with an inclined track, of a show-case carried thereby, and a rotary stop adapted to engage said case for limiting the movement thereof having a segmental engaging portion.



2. In a device of the character described, the combination with an inclined track, of a show-case carrying rollers upon the bottom thereof, designed to be supported by the track, and a stop adapted to engage said case and limit the movement thereof, the said stop consisting of a rotary shaft and a semicircular plate carried thereby.

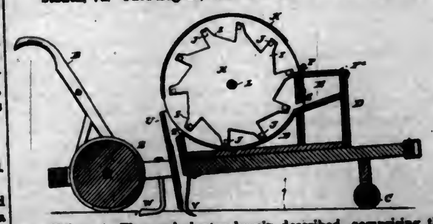
3. In a device of the character described, the combination with a pair of inclined tracks, of a series of show-cases, casters upon the bottoms of the show-cases designed to be supported by the tracks, horizontal rollers carried at the upper ends of the cases, a track in contact with the horizontal rollers, a rotary stop consisting of a horizontal shaft mounted adjacent to the rear edges of the show-cases, and a semicircular plate secured to the shaft at the center of its straight edge, substantially as specified.

608,211. SURF-BOAT. LEWIS W. STEVENS, Los Angeles, Cal. Filed May 21, 1896. Serial No. 593,402. (No model.)

Claim.—In a surf-boat, the combination with the hull, enmounted by a rigid roof a part of its length, a section hinged to and forming a part of said roof and adapted to fold back upon the same, a removable member extending upward from the hull at the stern, and tightly closing the space between the hull and said hinged member, of sea and land lines connected to the boat and means connected to the respective lines to draw the boat to and from the shore, substantially as described.

608,211.

608,212. REVOLVING GATE. SYLVESTER G. STEVENS, Lincoln, N. Y. Filed Oct. 13, 1897. Serial No. 655,063. (No model.)



Claim.—1. An improved farm-gate having a wheel secured thereto of a diameter equal at least to the height of the gate, whereby in operation the gate will rotate with said wheel, substantially as set forth.

2. An improved farm gate having an elliptical wheel or hoop secured thereto with its shortest axis equal at least to the height of the gate and with its longest axis at right angles to said gate, whereby in operation the gate will rotate with said wheel and will automatically remain closed, substantially as set forth.

3. An improved farm-gate provided with a wheel at one end of a diameter at least equal to the height of the gate, and a hinge at the other end capable of universal movement, substantially as set forth.

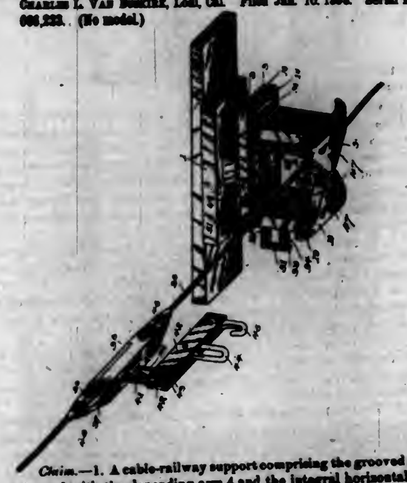
4. An improved farm-gate provided with a wheel at one end equal at least to the height of the gate, with a hinge at the other end capable of universal movement, and with means for automatically maintaining the gate in its closed position, substantially as set forth.

608,213. SEED-PLANTER. ALEXANDER T. STEWART, Ream's Station, Va. Filed Aug. 21, 1896. Serial No. 603,513. (No model.)

Claim.—1. The seed-planter herein described, comprising the frame and handles, the front guide-wheel, the box on said frame having at one end a compartment with a feed-opening in its rear wall, a slide controlling said opening, the portion of said box in rear of the seed-compartment having inclined bottom below the axis of the planter-wheel and provided with vertical longitudinal partitions, a

hinged cover to said box and carrying said slide, a planter-wheel formed with fingers having depressions and mounted to revolve between said partitions, a semicircular cover for said wheel, a covered-wheel and connections substantially as described between the same and the shaft of the seed-distributing wheel, all substantially as herein shown and described.

2. In a seed-planter of the character described, the combination with the frame, the supporting-wheels and the planter-wheel and the feed-box, of a shoe having its upper end extended upward to a point above the lower edge of said wheel with an inclined spout communicating therewith, a curved bottom to the compartment in which the planter-wheel revolves, said bottom having one edge turned downward and rearward, and secured to a fixed portion of the frame to constitute the upper end of said shoe, a shovel on the lower free end of the shoe, and scrapers carried by the frame to the rear of said shoe, all substantially as herein shown and described.



608,214. PRINTER'S CHASE. JAMES TONRAN, Little Rock, Ark. Filed May 8, 1897. Serial No. 636,736. (No model.)

Claim.—1. A set of similar bars for printers' use, each of said bars having at each of its ends an exteriorly-mitered hook which is of the same form as every other hook of the set, whereby any four bars of the set, of proper relative lengths, may be interlocked to form a chase or frame without exterior projections at the corners, substantially as specified.

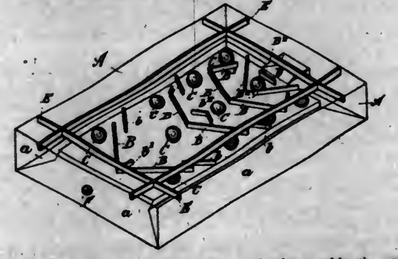
2. The herein-described frame or chase bar for printers' use having at each end an interlocking portion consisting of a quarter-sock extending from a shoulder of the bar and terminating in a mitered hook of the full width and thickness of the bar, substantially as specified.

608,215. CONVEYER FOR ENDLESS-ROPE RAILWAYS. CHARLES L. VAN DOREEN, Lodi, Cal. Filed Jan. 10, 1898. Serial No. 666,223. (No model.)

Claim.—1. A cable-railway support comprising the grooved plate 2 formed with the depending arm 4 and the integral horizontal shoe 5 formed with the bearing-socket 7 and semicircular groove 8, in combination with the spring-actuated bracket 14 sliding on said plate and formed with the integral arm 17, shoe 18, bearing-socket 20 and semicircular groove 21, and the rollers 10, 23 provided at their outer ends with the collars 9 and 22, respectively, as and for the purpose set forth.

2. The combination with the grooved plate 2 formed with the depending arm 4 and the integral shoe 5 provided with the bearing-socket 7 and semicircular groove 8, the rollers 10, 9 journaled in said socket, and the vertical parallel rollers 6, 6, journaled between the plate and shoe, of the spring-actuated bracket 14 sliding on said plate and provided with the integral arm 17, shoe 18, bearing-socket 20 and groove 21, the roller 23, 23 journaled in said socket 20, the vertical parallel rollers 19, 19, journaled between the bracket 14 and shoe 18 and the longitudinal roller-sleeve 28 journaled between the arms 4 and 17, substantially as shown and described.

3. The combination with the grooved plate 2, its integral arm 4 and shoe 5, of the bracket 14 having a sliding movement in the grooves of said plate and formed with the integral arm 17 and shoe 18, the U-shaped bolt connecting said arms 4 and 17 and provided with the right-angular plate 31, and the spring 34 extending between said plate 31 and the arm 17, substantially as shown and described.



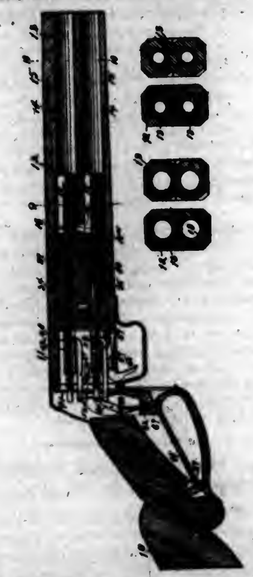
4. The combination with the plate 2 formed with the parallel grooves 3, 3, of the sliding bracket 14 formed with the parallel jaws 15, having the tongues 16 engaging said grooves, the bracket 48 adjustably secured to said plate and the roller 50 journaled in the free end of said bracket 48 and adapted to rest on the plane face of the sliding bracket 14, substantially as shown and described.

5. The conveyer-head 36 comprising the hinged jaws 37, 38 formed with the longitudinal grooves 40, 40, the convergingly-beveled faces 46, 46, and the integral parallel shanks 41, 41, the parallel bars 42, 42, arranged on the opposite sides of said shanks and means for simultaneously securing said bars, shanks and jaws together, substantially as shown and described.

608,216. PROCESS OF COLORING DOLL-HEADS. OTTO ZEH, Rudolstadt, Germany. Filed Sept. 30, 1896. Serial No. 607,472. (No specimens.)

Claim.—The method of creating the effect of burnt colors upon burnt white porcelain which consists in first applying to the said porcelain a thin coating of a water-color containing glue and glycerin; second, in applying to this coating of water-color a thin coating of transparent lac which sinks into and becomes a part of the said initial coating; third in allowing the before-mentioned coating to dry and subsequently applying to the same a thin coating of dull lac for the purpose of producing a dull instead of a glossy effect, substantially as described.

608,217. PUZZLE. JAMES ARCHIBALD, Buckie, Scotland. Filed Nov. 14, 1896. Renewed Dec. 2, 1897. Serial No. 660,894. (No model.) Patented in England Oct. 17, 1896, No. 23,080.



Claim.—1. In an improved ball-puzzle the combination with a box, a raised base in the said box forming channels at the sides, and a chamber serving as a goal, of divisions on the said base forming a number of compartments, ribs at the top and sides of the box protecting the side channels, balls placed within the compartments and free to roll within their respective divisions, and a small ball free to pass from one compartment to the other and to reach the goal, substantially as and for the purposes specified.

2. In a ball-puzzle the combination with a box side channels in the said box formed by a raised bottom and a chamber serving as a goal, of divisions on the base or bottom separating the box into four main compartments communicating at each end side ribs or strips at the top of the box protecting the side channels, balls placed in the compartments and free to move within their respective limits, and a small ball free to pass from one chamber to the other and to reach the goal substantially as and for the purposes specified.

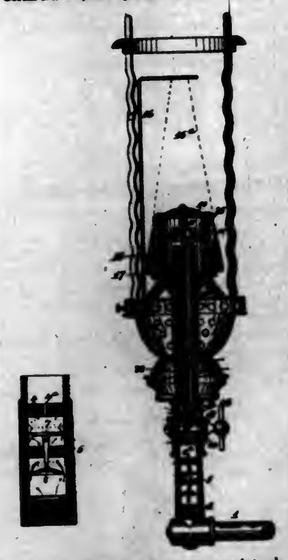
3. In an improved ball-puzzle the combination with the base A, sloping or beveled edges a, and chamber D serving as a goal, of the main divisions B, B', and B^2 on the said base and the smaller divisions b, b', and b^2 the balls C placed in the compartments formed by the divisions the side strips or ridges E and the ball F free to pass from one compartment to the other, substantially as described and shown and for the purposes specified.

608,218. BREECH-LOADING FIREARM. JOHN D. COOK, Bethrop, Colo. Filed May 22, 1897. Serial No. 637,801. (No model.)

Claim.—1. The combination of a frame having a front extension and stock, which front extension is bored to receive a pair of barrels and is provided with a cavity opening to one side thereof and shaped and arranged to receive a breech-block, a breech-block pivoted on the front extension and arranged to swing in and out relative to the cavity aforesaid and abut the rear ends of the barrels, an extractor pivotally connected with the breech-block and arranged to be engaged thereby at the limit of outward movement of the block, an ejector fixed to the extractor, a spring fixed to the front extension and arranged for temporary engagement with the ejector, and guide-springs fixed to the front extension and within the cavity therein and arranged to receive cartridges from the ejector and guide the same out of the cavity.

2. The combination of a frame having a front extension bored to receive barrels and formed with a cavity at the rear of the barrels, a breech-block hinged to the front extension and arranged to enter the cavity therein, impact-pins mounted for reciprocation in said breech-block in alinement with the barrels and spring-pressed in one direction, extractor and ejector mechanism fixed to the breech-block and firing mechanism located in the frame at the rear of the breech-block and arranged for contact with the impact-pins, together with leaf-springs 32, 33 located in the cavity at the rear of the breech-block and so shaped and arranged as to direct the cartridges from said cavity.

3. The combination of a frame having a front extension with a laterally-opening cavity, a breech-block shaped for insertion in said cavity and hinged to the front extension, impact-pins mounted for reciprocation in said breech-block, and extractor 19 located in front of the breech-block and pivoted conjunctively therewith which extractor is actuated by contact with the breech-block upon opening the same, an ejector mounted on the extractor, a spring 30 seated in the left-hand wall of the extension and frailly restraining the ejector pending the operation thereof, and leaf-springs mounted in the cavity of the extension and shaped and arranged to guide and direct cartridges from said cavity subsequent to the operation of the extractor and ejector.



4. In a gun a pair of firing-pins one above the other, springs for establishing the firing function of said pins, ratchet-arms on said firing-pins, a sear engaging one of said ratchet-arms, a trigger for tripping said sear, a sear-nose engaging the other of said ratchet-arms and integral with a trigger for tripping the same, pins traversing the rear ends of the firing-pins and ratchet-arms, a vertically-sliding block in the frame, pivoted cams on said block arranged for engagement with the traversing pins in the upward movement of the block to move the firing-pins rearwardly and permit the engagement of the sear and sear-nose with the ratchet-arms, a handle pivoted to the stock and pivotal connections between the handle and the vertically-sliding block.

5. In a gun a firing-pin, a sear arranged for connection with said firing-pin at times, a trigger for tripping said sear, a guide-rod on said firing-pin, a safety locking-rod on said firing pin and a safety locking-pin arranged for manual operation to engage the locking-rod and restrain the firing function of the firing-pin.

6. In a gun a yoke apertured in its end portions and split from said apertures to the ends thereof, whereby a pair of cartridges may be connected and conjunctively inserted and ejected relative to a pair of gun-barrels.

7. In a gun a safety locking-pin mounted for travel in a slotted seat, a grooved head on said pin, a locking-rod arranged for reciprocation in said grooved head, a hook on said rod, a firing-pin connected with said rod, and a nut swiveled on said pin whereby said pin may be locked in a given position to engage the grooved head with said hook and restrain the firing-pin against premature operation.

608,219. GAS-BURNER. CHARLES A. HALL, New York, N. Y., assignor of one-half to George B. Dayton, same place. Filed Mar. 17, 1897. Serial No. 628,042. (No model.)

Claim.—1. The governor or pressure-regulator hereinbefore described, the same comprehending a tube having therein a diaphragm with a central valve-opening, a needle-valve working loosely in said opening with its pointed end toward the gas-supply and carrying at its lower end a concave-convex disk with the concavity facing toward the gas-supply and at its upper end a plane disk, and beyond said plane disk, beyond the range of movement thereof, a perforated diaphragm.

2. The combination with a burner of the character described, of a non-expansible exterior ring or jacket arranged and adapted to serve as a seat for the base of the incandescent mantle.

3. The combination of a burner, a luminous or incandescent mantle, and an exterior non-expansible ring or jacket on the burner, between the same and the base of the mantle.

4. The combination of a burner of the character described, a cone-shaped metal ring fitted thereon, a non-expansible jacket or covering on said ring extending to the top of the burner, and a luminous or incandescent mantle.

5. The combination with the burner, of a tapered or cone-shaped ring surrounding the same, and a non-expansible jacket or covering on said ring to form a base or support for an incandescent mantle.

608,220. ROAD GRADER. HORATIO K. LEHMAN, Mount Pleasant, Iowa. Filed Jan. 18, 1897. Serial No. 619,645. (No model.)

Claim.—1. In a road-grader, a truss, a circle-bar revolubly mounted in said truss, a scraper-blade carried by said circle-bar, a cross-bar mounted on said circle-bar and provided with a central angular aperture, a shaft journaled in the central portion of the truss and having an angular end portion engaging in the angular aperture of the cross-bar, a pinion on said shaft and a manually-operated worm engaging said pinion to oscillate the shaft, cross-bar, circle-bar and scraper-blade.

2. In a road-grader, the combination of a circle-bar, a lock therefor, a truss revolubly carrying said circle-bar, a shaft stepped in said truss, a cross-bar on the circle-bar engaged by said shaft, a pinion on said shaft, a worm horizontally positioned in the truss and engaging the pinion, a sleeve universally jointed to said worm, a shaft slidingly connected with said sleeve, a hand-wheel on said shaft and crank mechanism for oscillating the truss, as set forth.

608,221. APPARATUS FOR PURIFYING SEWAGE-WATER. JAMES B. MILLER, Reading, Pa. Filed July 10, 1897. Serial No. 644,102. (No model.)

Claim.—1. A water-purifying apparatus which is adapted for use in connection with a sewerage system, said apparatus consisting of a separating building or structure, and a filtering building or structure, said first-named structure being placed adjacent to a sewer, and being provided with separate compartments which are in communication with said sewer by means of pipes, said pipes being in connection with separating-troughs placed in said compartments below which is placed separating material, below which are formed slush-chambers, said separating structure being also provided adjacent to one side thereof, with a receiving-well, and also with a flush-well, said flush-well and said receiving-well being in communication with said slush-chambers; and said filtering structure being also provided with filtering-compartments, a conduit placed over said filtering-compartments and provided with pipes which discharge into each of said compartments, said filtering-compartments being also provided with filtering material in the bottom thereof, and said structure being provided with pure-water chambers beneath said filtering material, and means for pumping the water in said receiving-well adjacent to the separating structure into said conduit, substantially as shown and described.

2. A water-purifying apparatus which is adapted for use in connection with a sewerage system, said apparatus consisting of a separating building or structure, and a filtering building or structure, said first named structure being placed adjacent to a sewer, and being provided with separate compartments which are in communication with said sewer by means of pipes, said pipes being in connection with separating-troughs, placed in said sewer below which is placed separating material, below which are formed slush-chambers, said separating structure being also provided adjacent to one side thereof, with a receiving-well, and also with a flush-well, said flush-well and said receiving-well being in communication with said slush-chambers, and said filtering structure being also provided with filtering-compartments, a conduit placed over said filtering-compartments and provided with pipes which discharge into each of said compartments, said filtering-compartments being also provided with filtering material in the bottom thereof, and said structure being provided with pure-water chambers beneath said filtering material, and means for pumping the water in said receiving-well adjacent to the separating structure into said conduit, and devices in connection with said separating structure for pumping the water from the flush-well back into the separating-compartments, substantially as shown and described.

3. The herein-described water-purifying apparatus adapted for use in connection with a sewerage system, said apparatus consisting of two structures, namely a separating building or structure and a filtering building or structure, said separating structure being provided with separating-compartments below which are placed slush-chambers, said compartments being in communication with a sewer, and said filtering building or structure being provided with filtering-compartments above which is placed a conduit, and which is provided with distributing-pipes, and with fresh-water chambers beneath said filtering-compartments, and means for conveying the water from the slush-chambers in the separating structure into said conduit, substantially as shown and described.

4. The herein-described water-purifying apparatus adapted for use in connection with a sewerage system, said apparatus consisting of two structures namely a separating building or structure and a filtering building or structure, said separating structure being provided with separating-compartments below which are placed slush-chambers, said compartments being in communication with a sewer, and said filtering building or structure being provided with filtering-compartments above which is placed a conduit, which is provided with distributing-pipes, and with fresh-water chambers beneath said filtering-compartments, and means for conveying the water from the slush-chambers in the separating structure into said conduit, said separating structure being also provided with a well which is in communication with said slush-chambers, and means for pumping the water from said well back into said separating-compartments, substantially as shown and described.

5. In an apparatus for purifying sewage-water, a building or structure provided with a plurality of separate compartments, means for supplying sewer-water to each of said compartments, an inclined and perforated trough in each of said compartments to one end of which the sewer-water is delivered, separating material forming the floor of said compartments, and a slush-compartment beneath said separate compartments, substantially as set forth.

6. In an apparatus for purifying sewage-water, a building or structure provided with separating-compartments which are in communication with a sewer, by means of pipes, said compartments being also provided with trough-shaped separators with which said pipes communicate, and beneath which are placed separating material through which the water passes into slush-chambers, said separating material consisting of straw, corncobs, and wire-screening, substantially as shown and described.

7. In an apparatus for purifying sewage-water, a building or structure provided with separating-compartments which are in communication with a sewer, by means of pipes, said compartments being also provided with trough-shaped separators with which said pipes communicate, and beneath which are placed separating material through which the water passes, into the slush-chambers, said separating material consisting of straw, corncobs, and wire-screening, and said separating-compartments being also provided with means for removing said separating material, substantially as shown and described.

8. An apparatus for purifying sewage-water, consisting of a separating building or structure provided with separating-compartments below which are placed slush-water compartments, said separating-

compartments being provided with pipes which communicate with a sewer, and means for separating the coarser articles from the water, and another building or structure provided with filtering-chambers over which passes a conduit, and means for conveying the water from the slush-chambers of the separating structure into said conduit, said filtering-chambers being provided with means for filtering the water, substantially as shown and described.

9. In an apparatus for purifying water, a building or structure provided with separating devices whereby the bulky and coarser substances are removed from the water, and a filtering structure which is divided into separate filtering-chambers beneath which are pure-water chambers, said filtering-chambers being provided with filtering material in the bottom thereof, and with a conduit which extends longitudinally thereover, said conduit being provided with distributing-pipes which are perforated on their under sides, and said conduit being also in connection with devices for pumping the water from the separating-chambers thereinto, substantially as shown and described.

10. An apparatus for purifying sewage-water, adapted to be used in connection with a sewer, said apparatus consisting of two separate buildings or structures, the first of which is provided with means for separating the bulky and coarser substances from the water, and with filtering-compartments and means for filtering the water, and the second of which is provided with filtering-compartments, and devices whereby the water is conveyed from the first structure into the filtering-compartments of the second, substantially as shown and described.

11. An apparatus for purifying sewage-water, adapted to be used in connection with a sewer, said apparatus consisting of two separate buildings or structures, the first of which is provided with means for separating the bulky and coarser substances from the water, and with filtering-compartments and means for filtering the water, and the second of which is provided with filtering-compartments, and devices whereby the water is conveyed from the first structure into the filtering-compartments of the second, said devices for filtering the water consisting of thin layers of gravel and sand which are placed in the bottom of said filtering-compartments and below which are pure-water chambers which are in connection with water-pipes, substantially as shown and described.

12. An apparatus for purifying sewage-water, consisting of two buildings or structures one of which is placed adjacent to the sewer, and is provided with separating-compartments in which the bulky or coarser substances are separated from the water which passes into slush-chambers, a water-receiving well in communication with said slush-chambers, a flush-well in communication with said slush-chambers, and the other building or structure being provided with filtering-chambers, and means for conveying the water from said receiving-well into said filtering-chambers, substantially as shown and described.

13. An apparatus for purifying sewage-water, consisting of two buildings or structures one of which is placed adjacent to the sewer and is provided with separating compartments in which the bulky or coarser substances are separated from the water which passes into the slush-chambers, a water-receiving well in communication with said slush-chambers, a flush-well in communication with said slush-chambers, and the other building or structure being provided with filtering-chambers, and means for conveying the water from said receiving-well into said filtering-chambers, and devices for pumping the water in said flush-well back in said separating-compartments, substantially as shown and described.

14. An apparatus for purifying sewage-water, consisting of two separate buildings or structures, one of which is provided with means for separating the bulky or coarser articles from the water, and a receiving-well into which the water passes, the other building or structure being provided with filtering-compartments, and a conduit into which the water from said well is preferably conveyed, said conduit being provided with perforated distributing-pipes which open into said filtering-compartments, and said filtering-compartments being provided with filtering material, consisting of gravel and sand which is placed in the bottom thereof, and said last-named building or structure being provided with pure-water chambers beneath said filtering-compartments, and with means for conveying the water therefrom, said chambers being also provided with flush-pipes, substantially as shown and described.

603,222. HOSE-COUPLING. JOHN N. MCLEAN, New York, N. Y. Filed Jan. 4, 1897. Serial No. 617,900. (No model.)

Claim.—1. A coupling device for pipes, tubes, &c., consisting of a hollow body or shell having two elastic sockets for the reception of the ends of the members to be coupled, one of said sockets extending outward and the other inward into the chamber of the body.

2. A coupling device for pipes, tubes, &c., consisting of a hollow elastic body or shell having at one end and integrally therewith an outwardly-extending socket for the reception of the end of one of the members to be coupled, and at the opposite end an inwardly-extending socket or sleeve for the reception of the other member to be coupled, said inwardly-extending socket projecting into the chamber of the body, and having walls gradually diminishing in thickness toward the inner or free end.

3. A coupling for pipes, tubes, &c., consisting of an elastic hollow body or shell having integral sockets for the reception of the ends of the members to be coupled, one of said sockets extending outwardly from the body and the other inwardly into the chamber thereof, the walls of said inwardly-extending socket gradually diminishing in thickness toward the inner end.

603,223. STEAM-GENERATOR. ORIL D. ORVIS, St. Louis, Mo. Filed June 14, 1897. Serial No. 640,754. (No model.)

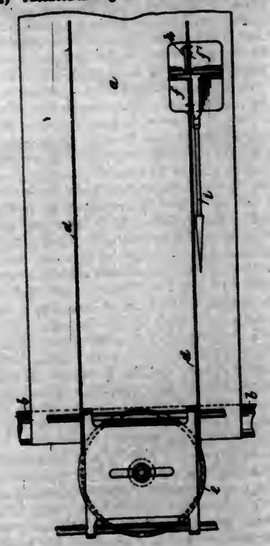
Claim.—1. In a steam-generator, the combination with a boiler and a pair of downdraft-furnaces spaced apart to form therebetween a flue, and a partition at the back of the furnaces and having an aperture in register with the said flue, of a bridge-wall back of the partition, water-tubes for the grate-bars of the furnaces and water-tubes forming parts of the adjacent side walls of the fire-boxes of the furnaces, both sets of such tubes extending backwardly to the bridge-wall, and service and return connection between such tubes and the boiler.

2. In a steam-generator, the combination with a boiler and a pair of downdraft-furnaces spaced apart to form therebetween a flue, and a partition at the back of the furnaces and having an aperture in register with the said flue, of a chambered bridge-wall back of the partition, water-tubes for the grate-bars of the furnaces and water-tubes forming parts of the adjacent side walls of the fire-boxes of the furnaces, both sets of such tubes extending backwardly to the bridge-wall and being in connection with the chamber thereof, a water-leg leading from the boiler to the chamber of the bridge-wall, and return connection between the forward end of the tubes and the boiler.

3. In a steam-generator, the combination with a boiler and the settings therefor including side walls and a transverse centrally-apertured partition, of a header back of the partition and constituting a bridge-wall, a header forming a part of the furnace-front, two sets of water-tubes connecting the headers and constituting grate-bars for a pair of downdraft fire-boxes, two sets of water-tubes connecting the headers and arranged in series leading from the plane of the grates toward the boiler and forming parts of the inner walls of the fire-boxes, such walls being spaced apart to form a flue registering with the aperture of the partition, and connection between the headers and the boiler.

4. In a steam-generator, the combination with a boiler and the settings therefor including side walls and a transverse centrally apertured partition, of a header back of the partition and constituting a bridge-wall, a header forming a part of the furnace-front, two sets of water-tubes connecting the headers and constituting grate-bars for a pair of downdraft fire-boxes, two sets of water-tubes connecting the headers and arranged in series leading from the plane of the grates toward the boiler and forming parts of the inner walls of the fire-boxes, such walls being spaced apart to form a flue registering with the aperture of the partition, a series of tubes connecting the headers and crossing the upper portions of the fire-boxes, and connection between the headers and the boiler.

5. In a downdraft-furnace, the combination with an upper set of water-tube grate-bars, of a lower set of water-tubes, the members of each set being vertically aligned, and mechanical connection between each of the lower tubes and the tube immediately above it, whereby the lower set aids in supporting the fuel.



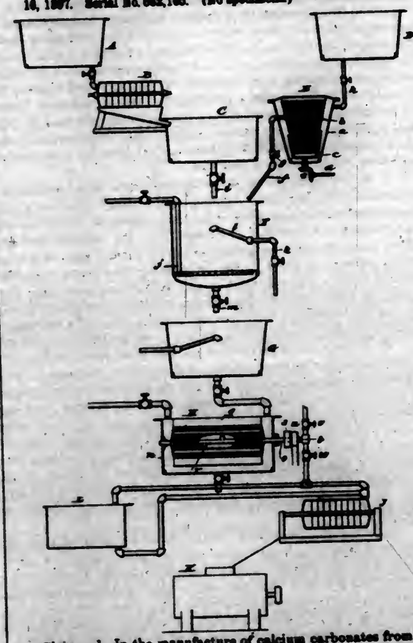
6. In a downdraft-furnace, the combination with an upper set of water-tube grate-bars, of a lower set of water-tubes, the members of each set being vertically aligned, masonry filling the interspace between the upper and lower members of each pair of tubes, whereby the lower set aids in supporting the fuel.

7. In a downdraft-furnace, the combination with an upper set of water-tube grate-bars, of a lower set of water-tubes, the members of each set being vertically aligned, the lower tubes being of less diameter than the upper tubes, and mechanical connection between each of the lower tubes and the tube immediately above it, whereby the lower set aids in supporting the fuel.

8. In a steam-generator, the combination with a pair of downdraft-furnaces spaced apart to form therebetween a flue-passage, and an updraft-furnace located below and intermediate of the downdraft-furnaces, of rotatable cylinders of refractory material at the sides of the updraft-furnace for receiving and delivering thereto material dropping from the downdraft-furnaces.

9. In a steam-generator, the combination with a boiler, and a furnace, of a bridge-wall combining a metallic chest, and an inverted arch of masonry resting upon such chest, and induction and eduction tubes connecting the chest with the boiler.

603,224. APPARATUS FOR CUTTING PILED FABRICS. JOHN PLATT, Warrington, England. Filed Nov. 10, 1897. Serial No. 658,093. (No model.) Patented in England Oct. 8, 1897, No. 23,063.



Claim.—1. The combination with a knife and guide, and means for actuating the same, of a frangible attachment to the actuating means, said frangible attachment being strong enough to actuate the knife when cutting under normal conditions, but weak enough to allow the knife to become detached when more than the normal resistance is encountered, substantially as and for the purposes herein-before set forth.

2. The combination with a knife and guide, knife-carriage, and means for reciprocating the same, of a frangible attachment connected at one end to the actuating means and at the other end to the traveling-knife carriage, substantially as and for the purposes herein-before set forth.

3. The combination with a traveling-knife carriage and means for actuating the same, of a frangible attachment connected at one end to the carriage and at the other end to the actuating means, substantially as and for the purposes hereinbefore set forth.

603,225. PROCESS OF PREPARING AMORPHOUS CARBONATE OF LIME FROM RESIDUES. HERMAN R. STURMER, Jamaica, N. Y., assignor to the Alkali Chemical Company, New York, N. Y. Filed Dec. 16, 1897. Serial No. 662,165. (No specimens.)

Claim.—1. In the manufacture of calcium carbonates from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, and in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, substantially as described.

2. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, and in subsequently drying said calcium carbonate, substantially as described.

3. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in subjecting the calcium oxid and alkali carbonate to the action of mechanical separators for removing the insoluble impurities therefrom, in causing these materials to react upon each other in the presence of water, and in then separating the calcium carbonate formed by

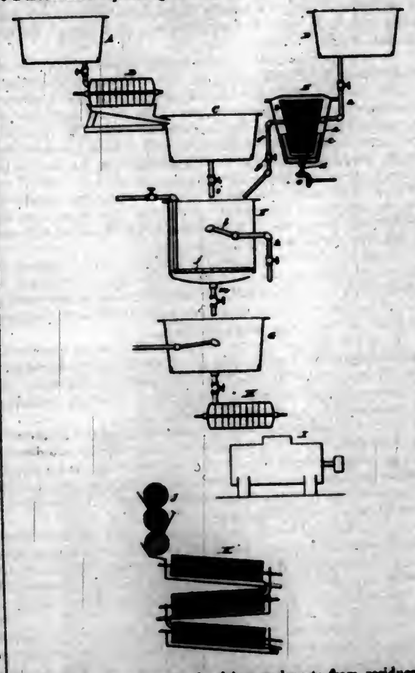
the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, substantially as described.

4. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in subjecting the calcium oxid and alkali carbonate to the action of mechanical separators for removing the insoluble impurities therefrom, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, and in subsequently dryiug said calcium carbonate, substantially as described.

5. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in filtering the alkali carbonate and in screening the calcium oxid for the removal of the soluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, and in subsequently drying said calcium carbonate, substantially as described.

6. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, and in subsequently subjecting the resulting calcium carbonate to the action of a mechanical separator, substantially as described.

7. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in subsequently subjecting the resulting calcium carbonate to the action of a mechanical separator, and in finally drying the same, substantially as described.



8. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in mixing the resulting calcium carbonate with water, and finally in passing said mixture through a mechanical separating apparatus, substantially as described.

9. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in mixing the resulting calcium carbonate with water, in passing said mixture through a mechanical separating apparatus, and finally in filtering the mixture, substantially as described.

10. In the manufacture of calcium carbonate from residues, the process of producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in removing the insoluble impurities from the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in mixing the resulting calcium carbonate with water, in passing said mixture through a mechanical separating apparatus, in filtering the mixture, and finally in drying the filter-cake, substantially as described.

608,226. PROCESS OF PREPARING AMORPHOUS CARBONATE OF LIME FROM RESIDUUM. HERMAN R. STURGES, Jamaica, N. Y., assignor to the Alkali Chemical Company, New York, N. Y. Filed Dec. 16, 1897. Serial No. 662,169. (No specimens.)

Claim.—1. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in causing the calcium oxid and alkali carbonate to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, and in subjecting said dry powder to a mechanical separating action, substantially as set forth.

2. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in causing the calcium oxid and alkali carbonate to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in drying the calcium carbonate, in reducing the dry calcium carbonate to powdered form, and in subjecting said dry powder to a mechanical separating action, substantially as set forth.

3. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in causing the calcium oxid and alkali carbonate to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali-hydrate solution, in mixing said calcium carbonate with water to dissolve the soluble impurities, including calcium hydrate, in passing the milk of calcium carbonate thus formed through a filter-press, thereby separating from the calcium carbonate the dissolved impurities, in drying the filter-cake, in grinding the dry cake, and in subjecting the powder thus obtained to a mechanical separating action, substantially as set forth.

4. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in causing the calcium oxid and alkali carbonate to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali-hydrate solution, in mixing said calcium carbonate with water to dissolve the soluble impurities, including calcium hydrate, in passing the milk of calcium carbonate thus formed through a filter-press, thereby separating from the calcium carbonate the dissolved impurities, in drying the filter-cake, in grinding the dry cake, and in subjecting the powder thus obtained to a mechanical separating action, substantially as set forth.

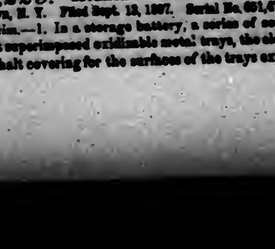
5. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in purifying the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in drying the calcium carbonate, in reducing the dry calcium carbonate to powdered form, and in subjecting said dry powder to a mechanical separating action, substantially as set forth.

6. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in purifying the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali hydrate and practically from all soluble impurities, including calcium hydrate, in drying the calcium carbonate, in reducing the dry calcium carbonate to powdered form, and in bolting said dry powder, substantially as set forth.

7. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in purifying the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali-hydrate solution, in mixing said calcium carbonate with water to dissolve the soluble impurities, including calcium hydrate, in passing the milk of calcium carbonate thus formed through a filter-press, thereby separating from the calcium carbonate the dissolved impurities, in drying the filter-cake, in grinding the dry cake, and in bolting the fine powder thus obtained, substantially as set forth.

8. In the manufacture of calcium carbonate from residues, the process for producing from calcium oxid and alkali carbonate a pure amorphous and extremely-divided calcium carbonate, which consists in purifying the calcium oxid and alkali carbonate, in causing these materials to react upon each other in the presence of water, in then separating the calcium carbonate formed by the reaction from the alkali-hydrate solution, in mixing said calcium carbonate with water to dissolve the soluble impurities, including calcium hydrate, in passing the milk of calcium carbonate thus formed through a filter-press, thereby separating from the calcium carbonate the dissolved impurities, in drying the filter-cake, in grinding the dry cake, and in bolting the fine powder thus obtained, substantially as set forth.

608,227. ICE-CREAM FREEZER. JOHN A. R. ARMSTRONG, Indianapolis, Ind., assignor, by direct and mesne assignments, of two-thirds to William L. Higgins and Theodore O. Collis, same place. Filed May 25, 1897. Serial No. 637,995. (No model.)



Claim.—1. The combination, in an ice-cream freezer, of a spindle having a shoulder, an outer receptacle or tank for the freezing mixture, an inner can or receptacle for the material to be frozen having a sleeve-like extension which passes through the bottom of the tank and is adapted to rest against the shoulder on the spindle and an overlapping upper edge adapted to engage with the upper edge of the outer casing, and a nut adapted to be placed on the sleeve-like extension outside the bottom of the tank and thus draw the parts tightly together, substantially as shown and described.

2. The combination, in an ice-cream freezer, of the tank forming the receptacle for the freezing mixture, the inner can for containing the material to be frozen formed with a sleeve-like extension which extends through the bottom of said tank to the outside and is secured thereto, a spindle mounted on a suitable base and passing through said sleeve-like extension to the interior, the sleeve E secured to the interior of said can at its bottom and surrounding said spindle for the greater portion of its length, the sleeve E^2 secured to the upper end of said spindle beyond the end of said sleeve E, which it surrounds, and scrapers secured to said sleeve E^2, the several parts being arranged and operating substantially as set forth.

3. The combination in an ice-cream freezer, of the base, the outer tank, the inner can, said tank and can being secured together and mounted to revolve on a spindle secured on said base and extending through the bottom of the structure into said can, a sleeve secured to the bottom of said can and surrounding said spindle for a greater portion of its length, another sleeve secured to the top of said spindle and extending down over said first sleeve, spring-arms and scrapers being secured to said outside sleeve and carried thereby, substantially as set forth.

4. The combination, in an ice-cream freezer, of a spindle carried by a suitable base, a revolving structure mounted thereon consisting of an outer tank or receptacle for the freezing mixture, an inner can or receptacle for the mixture to be frozen, an internal spring-mounted mechanism for removing the film of ice from the interior of the can, consisting of a sleeve mounted on said spindle, wings and scrapers, said sleeve having a slit across its upper end, and said spindle having a perforation therethrough which registers with said slit, and a pin adapted to be inserted in said perforation and engage with said slit and thus hold the said parts in the desired relation to each other, which relation may be changed from an operative to a non-operative position, substantially as shown and described.

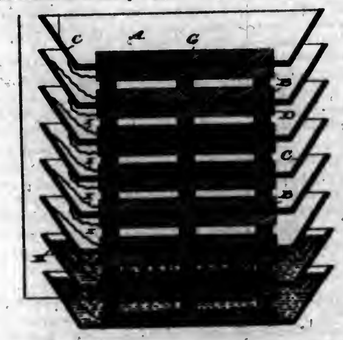
608,228. NAIL-PULLING ATTACHMENT FOR CLAW-HAMMERS. SILAS R. ASHLEY, Centralia, Mo., assignor of one-half to Edward J. Schmidt, same place. Filed Dec. 11, 1897. Serial No. 661,493. (No model.)

Claim.—1. A bifurcated nail-pulling attachment for claw-hammers, provided near its front end with downwardly-disposed shoulders 10, and below the same with a cross-bar 7, said shoulders and cross-bar providing between them a recess or opening adapted to snugly receive the claw portion of the hammer, substantially as described.

2. A bifurcated arched nail-pulling attachment for claw-hammers, provided near its front end with downwardly-disposed shoulders 10, and below the same with a cross-bar 7, and at its rear end with downwardly-disposed shoulders to bear upon the head of the hammer, substantially as described.

3. A bifurcated arched nail-pulling attachment for claw-hammers, provided near its front end with downwardly-disposed shoulders 10, and below the same with a cross-bar 7, and at its rear end with depending arms to embrace the sides of the hammer-head, and shoulders upon said arms, to bear upon said hammer-head, substantially as described.

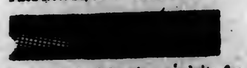
4. A bifurcated arched nail-pulling attachment for claw-hammers, provided near its front end with downwardly-disposed shoulders 10, and below the same with a cross-bar 7, and at its rear end with depending arms to embrace the sides of the hammer-head, shoulders upon said arms to bear upon said hammer-head, and a device for clamping said arms firmly against the opposite sides of the hammer, substantially as described.



5. A nail-pulling attachment for claw-hammers, comprising a bifurcated arched portion having near its front end side arms adapted to embrace the shank of the hammer, and shoulders to bear upon the claw thereof; said arms being connected by a cross-bar adapted to fit in the crotch at the junction of the hammer claw and shank, substantially as described.

6. A nail-pulling attachment for claw-hammers, comprising a bifurcated arched portion having at its front end downwardly-disposed shoulders to bear upon the curved surface of a hammer-claw, depending side arms connected by a cross-bar below said shoulders so as to form a recess or opening to receive the hammer-claw, rearwardly-disposed arms formed integral with the first-named arms and adapted to embrace the sides of the hammer-shank, and provided with shoulders which bear against the front edge of said hammer-shank; said arched portion being provided also with depending arms which embrace the hammer-head, substantially as described.

608,229. STORAGE BATTERY. EDWARD A. BARBER, Watertown, N. Y. Filed Sept. 13, 1897. Serial No. 651,474. (No model.)

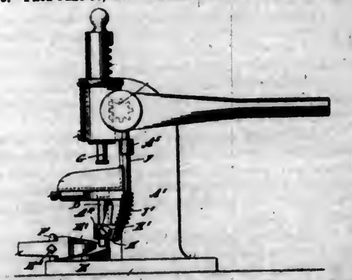


Claim.—1. In a storage battery, a series of separate and independent superimposed oxidizable metal trays, the electrolyte therein, the asphalt covering for the surfaces of the trays exposed to the elec-

trolyte, to prevent the trays from becoming gradually oxidized and destroyed, the positive and negative plates and the electrical connections between each of said plates, substantially as set forth.

2. In a storage battery, the series of superimposed metallic trays, the asphalt coverings for said trays as described, the independent positive plates resting on the bottom of the said trays, insulators across the positive plates, negative plates resting on the said insulators, combined with the independent metallic connection between each of the said plates and the side of the adjacent tray, which connections are wholly immersed in the electrolyte.

603,280. LINING FOR INTERIOR CONDUITS. SIGMUND BERGMANN, New York, N. Y., assignor to the Sprague Electric Company, same place. Filed Nov. 24, 1896. Serial No. 613,241. (No model.)



Claim.—1. The method of forming conduits for electric wires which consists in treating a tube made from an absorbent vegetable fiber in a bath of fireproof material, than treating it in a bath of drying-oil, and finally drying the tube so treated, substantially as described.

2. In a conduit for electric wires, a tube made from an absorbent vegetable fiber, a fireproofing material and a drying-oil in the pores of said fabric, substantially as described.

3. In a conduit for electric wires, a seamless tube made from an absorbent vegetable fiber in combination with tangstate of soda and a drying-oil in the pores thereof, substantially as described.

603,281. TABLET-MACHINE. JAMES CORNELIUS, Ridgewood, N. J. Filed June 30, 1897. Serial No. 642,973. (No model.)

Claim.—1. A tablet-machine comprising a die, an anvil adapted to pass into the said die, means for raising and lowering the said anvil to move the latter into the die and permit the same to pass out of the die, a plunger adapted to pass into and out of the die, to press the material therein into a tablet and to force the latter with the anvil out of the die for discharging the finished tablet, and a device for removing the tablet from the anvil on the receding of the said plunger from the die, substantially as shown and described.

2. A tablet-machine, comprising a die, an anvil adapted to pass into said die, means for raising and lowering the anvil, a reciprocating plunger for pressing the material in the die to form a tablet and force the latter with the anvil out of the die, and a swinging arm controlled by the plunger-operating means for removing the tablet from the end of the anvil, substantially as described.

3. A tablet-machine comprising a die, an anvil adapted to pass into the said die, means for raising and lowering the said anvil to move the latter into the die and permit the same to pass out of the die, a plunger adapted to pass into and out of the die, to press the material therein into a tablet and to force the latter with the anvil out of the die for discharging the finished tablet, and a device for removing the tablet from the anvil and controlled from the means for operating the said plunger, substantially as shown and described.

4. A tablet-machine provided with a die, an anvil adapted to pass into and out of the said die, and a manually-operated cam for controlling the movement of the said anvil, substantially as shown and described.

5. A tablet-machine provided with a manually-operated cam mounted to turn and formed with a spiral cam-surface, substantially as shown and described.

6. A tablet-machine provided with a cam mounted to be turned and formed with a spiral cam-surface, and adjustable means for limiting the turning motion of the said cam, as set forth.

7. A tablet-machine provided with a die, an anvil adapted to pass into and out of the said die, and a cam mounted below the anvil and having its axis eccentric to the axis of the said anvil, the said cam having a spiral face engaged by the end of the said anvil, substantially as shown and described.

8. A tablet-machine provided with a die, an anvil adapted to pass into and out of the said die, a cam mounted to be turned and having its axis eccentric to the axis of the said anvil, the said cam having a spiral face engaged by the said anvil, and an adjustable stop-pin for limiting the turning motion of the said cam, substantially as shown and described.

9. A tablet-machine comprising a die, a slidable plunger for the said die, an anvil adapted to pass into and form a bottom for the said die, and a cam mounted to be turned and engaging the said anvil to regulate the thickness of the tablet to be formed in the die, substantially as shown and described.

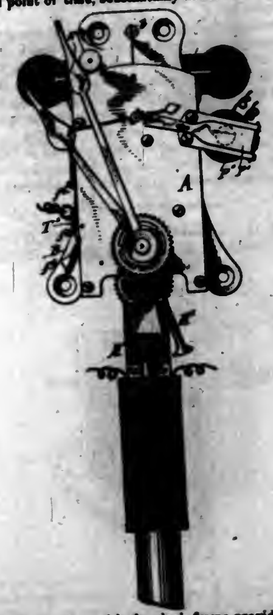
10. A tablet-machine provided with an arm mounted to swing for discharging the formed tablet from the machine, a spring-pressed rod connected with the said arm, and a cam for pressing the said rod to impart a swinging motion to the same in one direction, the return movement of the arm being accomplished by the spring of the arm, substantially as shown and described.

11. A tablet-machine provided with a slidable anvil, means for raising and lowering the said anvil, and a swinging arm adapted to swing over the same on lowering the anvil below the said arm, substantially as shown and described.

12. A tablet-machine, provided with an anvil, a bearing in which the anvil is fitted to slide, and a friction device for holding the anvil in place in the bearing, substantially as shown and described.

13. In a tablet-machine, the combination with a die, a plunger, means for operating the plunger, and a reciprocating anvil, of a swinging and spring-actuated arm controlled by the plunger-operating means for removing the tablet from the anvil, substantially as described.

14. In a tablet-machine, the combination with a die, a plunger, a plunger-operating lever having a cam-surface, and a reciprocating anvil, of a sliding and spring-pressed rod having one end engaging the said cam-surface, a bell-crank lever to one member of which the said rod is connected, and a pusher-arm secured to the other member of the bell-crank lever, substantially as described.

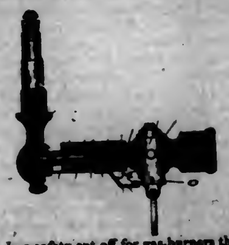


603,282. ELECTRIC CLOCK. SIGMUND FREUND, New York, N. Y. Filed June 28, 1897. Serial No. 642,806. (No model.)

Claim.—1. The combination, with the minute-hand arbor, of a synchronizing electromagnet, and an arm extending radially from the said arbor and provided at its outer end with an armature, adapted to be attracted by said magnet for moving the minute-hand forward or backward to a given point of time so as to synchronize with a master or other clock, substantially as set forth.

2. The combination, with the minute-hand arbor, provided with a minute-hand, of a synchronizing electromagnet, and an armature applied to the said arbor diametrically in line with the said minute-hand and acting as a counterpoise, said electromagnet being arranged in the circle described by the armature, substantially as set forth.

3. The combination, with the arbor of the minute-hand, of a synchronizing electromagnet located adjacent to the same, an armature extending radially from said arbor, and means for adjusting said armature longitudinally to and from the arbor and toward the pole of the electromagnet, said magnet and armature cooperating to produce the forward or backward motion of the minute-hand and the synchronizing of the same with a master or other clock, substantially as set forth.



4. The combination, with the arbor of the minute-hand, of a synchronizing electromagnet located adjacent to the same, an arm extending radially from the said arbor, means for adjusting the arm around the arbor, an armature, and means for connecting the armature with said arm and longitudinally adjusting the said armature toward the pole of the electromagnet, said magnet and armature producing the forward or backward movement of the minute-hand to the desired point of time, substantially as set forth.

5. The combination, with the clock-frame provided with a supporting-bracket, of a synchronizing electromagnet attached to the bracket, a plate forming the outer clamping part of the bracket, and provided with bearings for the intermediate transmitting mechanism of the hour-hand, said bracket and plate providing a space between them, and an armature attached to the arbor of the minute-hand and adapted to move through said space, substantially as set forth.

6. The combination, with the seconds-hand arbor, provided with a friction-thimble having a tubular cam portion with converging cam-faces on its end, whereby the cam portion is formed with a point and with a notch on its opposite side, and means for applying said thimble to the seconds-hand arbor, of a synchronizing electromagnet, and an armature provided with means for engaging the cam-faces of said friction-thimble, substantially as set forth.

603,283. SAFETY CUT-OFF FOR GAS-COCKS. PHILIP C. PARDWELL, Toronto, Canada, assignor of two-fifths to George H. Locke and George Hambly, same place. Filed Apr. 24, 1897. Serial No. 633,796. (No model.)

Claim.—1. In a safety cut-off for gas-burners the combination of the main valve, a valve-case for the main valve, a cylinder connected to the valve-case, the burner, a piston connected to the burner working within the cylinder, a head for the piston, a valve-seat within the cylinder adapted to be engaged by the piston-head, means for holding the piston-head away from the valve-seat when the main valve is open, and means to move the piston-head against the valve-seat to close the passage to the burner when the main valve is closed, substantially as specified.

2. A safety cut-off for gas-burners consisting of a main valve, the burner, a cylindrical passage from the main valve to the burner, a spring-operated piston-valve to close the cylindrical passage after the main valve has been turned sufficiently to extinguish the light, substantially as specified.

3. In a safety cut-off for gas-burners the combination of the main valve, the burner, a passage from the main valve to the burner, a spring-operated piston-valve within the passage, a latch connected to the piston-valve, and a keeper connected to the main valve to engage the latch when the main valve is open, and to release the latch when the main valve is closed, substantially as specified.

4. In a safety cut-off for gas-burners, the combination of the main valve, a cylinder connected to the main valve, a valve-seat within the cylinder, the burner, a piston-valve to engage the valve-seat, and a hollow piston-rod connected to the piston-valve and burner, substantially as specified.

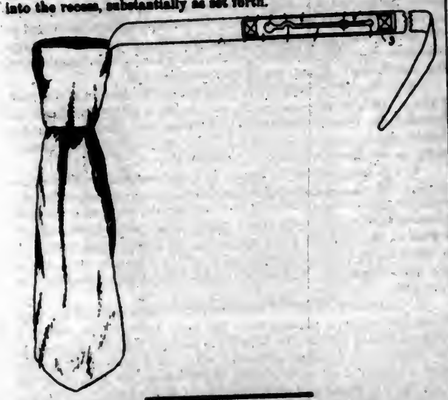
5. In a safety cut-off for gas-burners, the combination of the main valve, a cylinder connected to the main valve, a valve-seat within the cylinder, the burner, a piston-valve to engage the valve-seat, a hollow piston-rod connected to the piston-valve and burner, a guide-rod connected to the burner, a guide embracing the cylinder and guide-rod, a spring-latch connected to the guide-rod, and a catch connected to the main-valve plug, adapted to engage the latch, substantially as specified.

6. In a safety cut-off for gas-burners the combination of the main valve, the burner, a passage from the main valve to the burner, a spring-operated piston-valve within the passage, a latch connected to the piston-valve, a keeper connected to the main valve to engage the latch when the main valve is open, and to release the latch when the main valve is closed, and means for automatically moving the piston-valve to close the passage to the burner when the main valve is closed, substantially as specified.

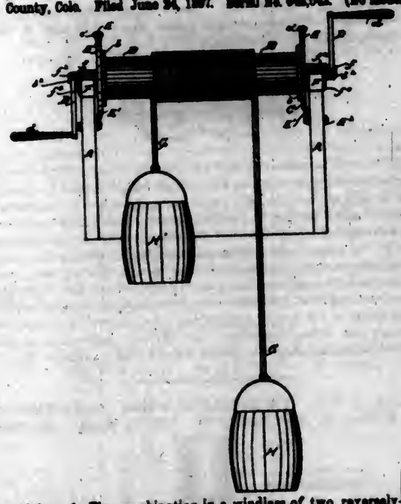
603,284. CHECK-HOOK. FRED J. FROST, THEODOR SOURER, and CHARLES W. COOLIDGE, Grundy Centre, Iowa. Filed Mar. 16, 1897. Serial No. 627,870. (No model.)

Claim.—The combination of two sections forming respectively a checkrein-hook, and a terret, the sections being adapted for connection at right angles with each other and each section having an eye, one eye having an opening leading outward from the eye to permit the entrance and the removal of the other section, the sections further having respectively at the said opening in one section and at the coacting point of the other section, a mating rib and groove ranging in a direction outward from the eye, the rib and groove ranging in a direction outward from the eye of the opposite member and at respectively parallel with the eye of the opposite member and at right angles to the eye in conjunction with which it is formed, the grooved and ribbed formations thus offering obstructions to each other until the members are moved twice at right angles.

603,285. NON-REFILLABLE BOTTLE. GEORGE HIGHFIELD, Scranton, Pa. Filed Aug. 26, 1896. Serial No. 604,080. (No model.)



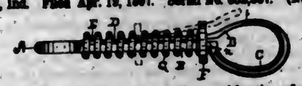
Claim.—In an antirefilling bottle, the combination with a bottle proper having a groove with annular beads formed in its neck, of a stopper comprising a sleeve having an annular flange at the upper end, annular beads upon its outer surface and a valve-seat, a cork packing applied over said sleeve and the beads formed thereon and adapted to be seated in the beaded groove of the neck, a valve mounted in said valve-seat, a ball stop suspended from said valve and an apertured protecting-cap for the upper end of said sleeve, substantially as described.



603,286. NECKTIE-FASTENER. ISAAC H. MALLIN, Chicago, Ill. Filed Sept. 27, 1895. Serial No. 563,590. (No model.)

Claim.—As a new article of manufacture, a necktie-fastener com-

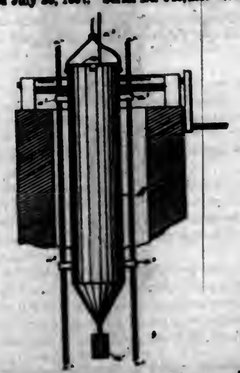
prising a plate having a longitudinal parallel-sided slot formed therein, one end of the slot being provided with an enlarged opening, and one wall of the slot adjacent to the opening being provided with a recess and the opposite wall being provided with a stop projecting into the recess, substantially as set forth.



603,287. WINDLASS. CHESTER A. MORRISON and JOHN MORAN, Manitou, Colo.; said Moran assignor to, and said Morrison assignor of part to, Laura B. Morrison, same place, and William Whalen, El Paso County, Colo. Filed June 24, 1897. Serial No. 642,042. (No model.)

Claim.—1. The combination in a windlass of two reversely-set ratchets, and two pawls having the lips *e*, *e*, at their ends which engage the teeth, the joints *d* near the centers, and the eyes E^3 at their base ends, substantially as described and for the purpose set forth.

2. The combination in a windlass of two deeply-recessed, countersunk bases F, two caps *f* and bolts f^1, with the drum-shafts b^2 to which they are permanently attached, and adapted to slip over and rest loosely on the ends of the supporting standards A, substantially as described and for the purpose set forth.



603,288. HAND SNAP-HOOK. JOHN NUERNBERGER, Jr., near Atherton, Ind. Filed Apr. 19, 1897. Serial No. 632,827. (No model.)

Claim.—1. In a hand snap-hook, the combination of a hook consisting of a loop A, a shank B, having shoulders *n*, and a hook C, with a spring-steel tongue D, riveted to said shank B, near the loop A, said tongue being adapted to spring outwardly when released; a flat sliding ring F, having a central opening *c*, to receive the shank B and tongue D; a coil-spring G, surrounding said shank B and tongue D, having its bearing at one end against the shoulders *h* of the loop A, and at the other end against the inner face of the flat ring F, thereby pressing said ring against the shoulders *n*, of the shank B, and normally securing the tongue D against the end *i*, of the hook C, all as shown and described.

2. In combination in a hand snap-hook of the class described, the hook consisting of the strap-eye A, the shank B, having the shoulders *n*, on each side at its front end, the hook C, having the free end *i*; the flat ring F, adapted to surround and slide upon the shank B, and tongue D, and in its forward position to normally lock said tongue; the outwardly-opening spring-steel tongue D, secured to the shank B, by the rivet E; and the coil-spring G, surrounding said shank B, and tongue D, and normally pressing said ring F, against the shoulders *n*, on said shank, thereby securing the free end of the tongue D, against the end *i*, of the hook C, as set forth.

608,289. COOLING VESSEL. HOMER J. REYNOLDS, Corning, Iowa. Filed July 20, 1897. Serial No. 645,495. (No model.)

Claim.—An oblong cylinder of good heat-conducting material, made water-tight, weighted at the lower end and having a hinged or removable cover at the upper end attached to rods to keep the same perpendicular, and containing a second cylinder open at the side with shelves, the whole adapted to be used in the manner and for the purpose set forth.

608,240. STORING-PACKAGE FOR LIQUIDS. JAMES TOMLINSON, Detroit, Mich., assignor to Elizabeth Tomlinson and William C. Duffus, same place. Filed Feb. 27, 1897. Serial No. 625,903. (No model.)

Claim.—In a package for liquids, in combination with a wooden foundation of veneer wound in coils, a metal jacket wound in a coil around said foundation, having the inner end engaged under the overlapping end of the wooden coil, and the outer end overlapping the wooden overlap, substantially as described.

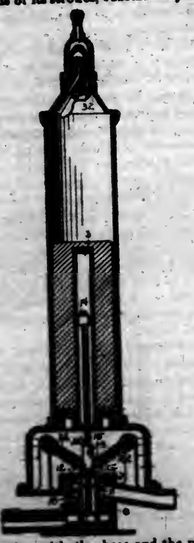
608,241. RUNNING-GEAR. JOHN H. VAN SCHUYVER and GEORGE H. DOW, Salt Lake City, Utah. Filed June 12, 1897. Serial No. 640,543. (No model.)

Claim.—1. The combination with the front and rear bolsters and axles, and the reach, of draft-rods extending from the front end of the reach along its sides to and connected with the rear bolster the front ends of the rods being connected by a cross-bar, and the tongue pivoted to the front bounds and having a clevis at its rear end having a cross-piece engaging said cross-bar; substantially as described.

2. The combination with the front and rear bolsters and axles and the reach, of draft-rods extending from the front end of the reach along its sides and connected to the rear bolster, a curved cross-bar connecting the front ends of said rods, and the tongue pivoted to the front bounds and having a clevis on its rear extremity provided with a curved block engaging said cross-bar; substantially as described.

3. The combination with the reach and front and rear bolsters, the latter being adjustable, of rods extending alongside the reach from its front end and provided with adjustable blocks, engaging the rear side of the rear bolster, the front ends of said rods being connected by a cross-bar and the pivoted tongue having a clevis at its rear extremity engaging said cross-bar; substantially as described.

4. The combination with the reach, the front axle and bolster, and the adjustable rear axle and bolster, of the rods provided at the front end of the reach with a curved cross-bar and extending rearwardly through and beyond the rear bolster and there provided with recesses or notches, adjustable blocks on the rods and provided with keys to engage said recesses, and the pivoted tongue connected with the said curved cross-bar; substantially as described.



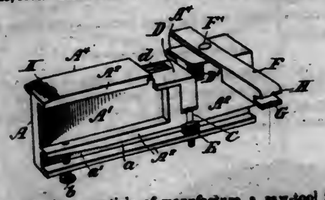
5. The combination with the running-gear and the draft-rods extending from the rear bolster to the front end of the reach and there connected by a curved cross-bar, of the tongue pivoted to the front hounds and provided at its rear end with a clevis containing a curved block engaging said curved cross-bar, the upper and lower clevis-straps extending along the tongue to the doubletree-bolt which passes through them, and a second bolt passing through the clevis-straps and tongue in rear of the doubletree-bolt; substantially as described.

6. The combination with the wagon running-gear, and the draft-rods extending from end to end of the reach and connected in front thereof by a curved bar, a cross-plate connecting said rods at the rear end of the reach, a plate at the rear side of the rear bolster and provided with an opening for the reach and notches for the rods, blocks on the rods, yielding washers on the rods between the plate and blocks, of the tongue connected with the front hounds and the front end of the draft-rods; substantially as described.

7. The combination with the wagon running-gear reach which has longitudinal side grooves, sleeves on the reach, and the draft-rods extending along said grooves and through the sleeves, the front ends of the rods being connected by a cross-bar and their rear ends being connected to the rear bolsters, of the pivoted tongue having a draft-connecting also with the front ends of said draft-rods; substantially as described.

603,242. HYDRAULIC AIR-COMPRESSING PUMP. EDWARD H. WEATHERHEAD, Cleveland, Ohio. Filed Apr. 11, 1896. Serial No. 587,091. (No model.)

Claim.—1. The combination with the base having inlet and outlet ports, the air-compressing chamber and the piston in said chamber, in combination with a combined inlet and outlet valve constructed to open one of said ports at a time and at the same time to close the other port, and mechanism between said piston and valve to actuate the valve, said mechanism comprising a rod loosely connected with said valve and piston, respectively, and spring-actuated mechanism located in the said base and engaging said rod to facilitate the action of the valve at the ends of its strokes, substantially as described.



2. The combination with the base and the piston-cylinder and the piston therein, of valve mechanism in the base to control the flow of fluid to and from the pump, a rod connecting said valve mechanism and piston, spring-pressed rods pivotally connected to said rod and supports in which said spring-pressed rods are adapted to slide, substantially as described.

3. The casing having a fluid-pressure chamber and inlet and exhaust ports on different horizontal planes, and a perforated hollow valve between said ports and chamber, in combination with the piston, the valve-actuating rod entering said piston and said valve, and the spring-pressed rods connected with said rod above the valve, the said valve having packing about its side above and below the inlet-port and constructed to seat on the bottom of the base, substantially as described.

REISSUES.

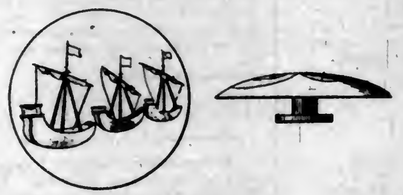
11,661. SAW-TOOL. RICHARD BENNETT, Newark, N. J., assignor to the Bennett Combination Saw-Tool Company, of New York. Filed Feb. 26, 1898. Serial No. 671,712. Original No. 580,963, dated Oct. 27, 1896.

Claim.—1. As an article of manufacture, a saw-tool for side-dressing, comprising a suitable stock having one side or face thereof provided with an even bearing-surface, and with a recess in said face longitudinally graduated in depth, and a file adjustable in said recess and correspondingly tapered so as to have its outer face always parallel with the said bearing-surface of the stock, and means for holding the file in place, substantially as set forth.

2. As an article of manufacture, a saw-tool adapted for use in cutting down the raker-teeth of a saw, comprising a suitable stock, and an adjustable gage supported by the stock and having a slot

open at one end to receive a raker-tooth to be cut down, substantially as set forth.

3. As an article of manufacture, a saw-tool adapted for use in setting the cutting-teeth and cutting down the raker-teeth of a saw, comprising a suitable stock provided with a flange along one edge and having a recess therein, an adjustable raker-tooth gage working in said recess, a setting member movably secured to the flanged edge of the stock and having one of its ends provided with a setting-slot and normally resting in said recess above the said gage, the face of said flanged edge serving as an even bearing-surface for the side of the saw when the setting member is in use, and the lower side of said flange serving as an even bearing-surface for the points of the teeth when the gage is in use, substantially as set forth.



4. As an article of manufacture, a saw-tool comprising a stock or body portion having the even faces A^2, A^3, the face A^2 being provided with a recess or depression longitudinally graduated in depth, in which a tapering file may be adjustably seated for side-dressing saw-teeth and means for adjustably securing the file in said recess; said face having an independent and narrow recess *a*, within which the file may be held in position edgewise and sprung or bent for convenient use in jointing saw-teeth, a raker tooth gage vertically adjustable in the recess *D'* in the stock, the flange A^4, and the setting member F, combined and related, substantially as set forth.

5. As an article of manufacture, a saw-tool comprising a stock having the flat even sides A^2 and A^3, and flange A^4 extending from the flat even upper edge of the stock, the face A^2 having the recesses A' and *a* constructed as described, the tapering file, the recess D', gage D having the open slot *d*, and setting member F having slot G, substantially as set forth.

6. The herein-described combination-tool, the same comprising a stock or body portion having one of its faces provided with a tapering or graduated recess or depression A' within which a file may be adjustably seated, a set-screw for adjusting and securing the file in said recess, an independent narrow and tapering recess *a* within which the file is adjusted and held in position for convenient use in jointing saw-teeth, a raker-tooth gage D vertically adjustable within a recess in the stock as described, means for vertically adjusting the gage-block, and the swinging setting member F, pivoted at a point adjacent to one of its ends to the stock, and having its opposite end notched as described, substantially as described and for the purpose specified.

DESIGNS.

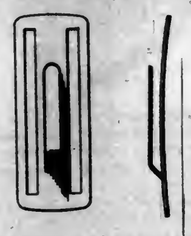
28,502. BADGE OR BUTTON. JOHN H. H. MCNAMEE, Cambridge, Mass. Filed Mar. 6, 1897. Serial No. 626,295. Term of patent 14 years.

Claim.—A design for a badge or button, substantially as shown and described.

28,503. BACK FOR BRUSHES OR SIMILAR ARTICLES. LOUIS W. PFEIFER, Attleborough, Mass., assignor to the James E. Blake & Company, same place. Filed Mar. 12, 1898. Serial No. 673,665. Term of patent 7 years.

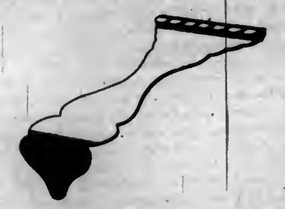
Claim.—The design for the back of a brush or similar article, herein shown and described.

28,504. BORDER FOR SILVERWARE. PIERRE JOSEPH CRIBOU, New York, N. Y., assignor to Ferdinand Fuchs, Henry Fuchs, and Frederick Fuchs, Jersey City, N. J. Filed Dec. 8, 1897. Serial No. 661,307. Term of patent 3½ years.



Claim.—The design for a border for silverware and similar articles substantially as herein shown and described.

28,505. BUCKLE. HOWARD C. HOSLE, New Britain, Conn. Filed Feb. 24, 1898. Serial No. 671,538. Term of patent 7 years.

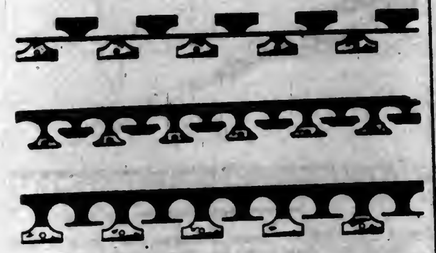


Claim.—The design for a buckle herein shown and described.

28,506. SKIRT-SUPPORTER. JOSEPH A. LEVISON, New York, N. Y. Filed Feb. 16, 1898. Serial No. 670,860. Term of patent 3½ years.

Claim.—The design for a skirt-supporter, herein shown and described.

28,507. TAILPIECE FOR STRINGED INSTRUMENTS. ELEANOR D. SOU, Utica, N. Y. Filed Feb 21, 1898. Serial No. 671,202. Term of patent 7 years.



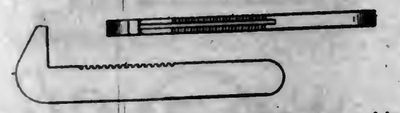
Claim.—The design for a tailpiece for stringed instruments, substantially as herein shown and described.

28,508. DOOR-BUTTON. WALTER LIPPINCOTT, Philadelphia, Pa. Filed Feb. 24, 1898. Serial No. 671,536. Term of patent 7 years.

Claim.—The design for a door-button substantially as herein shown and described.

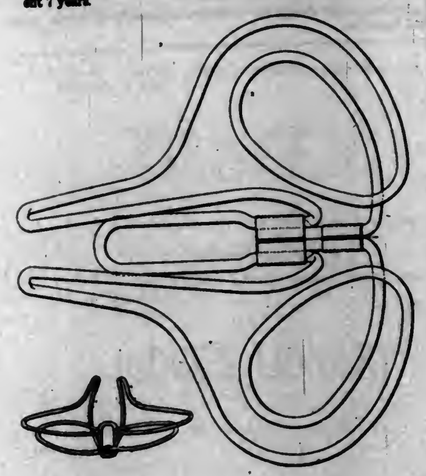
28,509. CORNER-PROTECTOR STRIP. ROBERT E. DANIELS, Youngstown, Ohio. Filed Apr. 5, 1897. Serial No. 630,976. Term of patent 14 years.

Claim.—The design for a corner-protector strip for walls, herein shown and described.



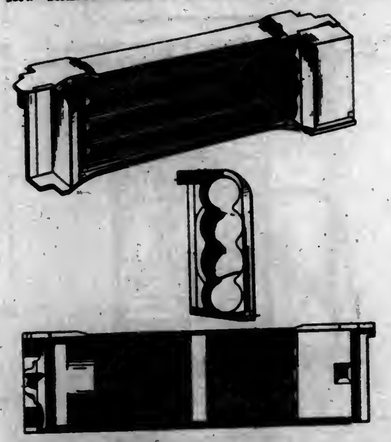
28,510. WITHDRAWN.

28,511. WASHER. FREDERICK W. HUMBERGER, Milwaukee, Wis. Filed Oct. 27, 1897. Serial No. 656,564. Term of patent 3½ years.



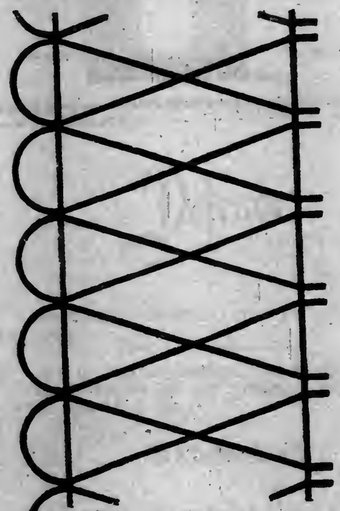
Claim.—The design for a washer, as herein shown and described.

28,512. WRENCH-FRAME. ROBERT CORBIN BLEECH, Southington, Conn., assignor to The Peck, Stow & Wilcox Company, same place. Filed Dec. 23, 1896. Serial No. 616,816. Term of patent 7 years.



Claim.—The design for a wrench-frame herein shown and described.

28,513. BICYCLE-SADDLE SPRING. GEORGE PARKER HOLDEN, Kingston, N. Y. Filed Nov. 13, 1897. Serial No. 658,498. Term of patent 7 years.



28,514. WATER-FRONT FRAME. ROBERT HARTLEY, Rochester, N. Y., assignor to the Sill Stove Works, same place. Filed Aug. 23, 1897. Serial No. 649,260. Term of patent 14 years.

Claim.—The design for a water-front frame, substantially as shown and described.

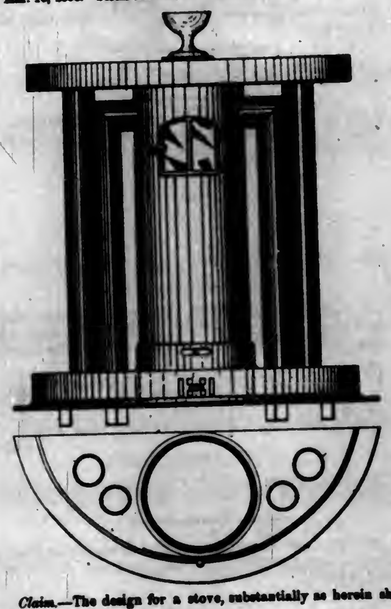
28,515. PATTERN FOR WIRE FENCING. DAVID M. KITSELMAN, Ridgeville, Ind. Filed Jan. 26, 1898. Serial No. 668,078. Term of patent 7 years.

Claim.—The design for a pattern for wire fencing, herein shown and described.

28,516. TEXTILE FABRIC. ISAAC H. GOODMAN, Philadelphia, Pa. Filed Feb. 4, 1898. Serial No. 669,153. Term of patent 3½ years.

Claim.—The design for a textile fabric, substantially as described and as shown in the accompanying drawing.

28,517. BADGE. WILLIAM H. HAYNES, Somerville, N. J. Filed Mar. 12, 1898. Serial No. 673,662. Term of patent 3½ years.



Claim.—The design for a badge as herein shown and described.

28,518. HANDLE FOR BUTTON-HOOKS, &c. FERDINAND THIMAN, Brooklyn, N. Y. Filed Mar. 12, 1898. Serial No. 673,663. Term of patent 3½ years.

Claim.—A design for a handle for button-hooks, and similar articles, substantially as herein shown and described.

28,519. STOVE. CHARLES STUMMBORN, New York, N. Y. Filed Mar. 10, 1898. Serial No. 672,494. Term of patent 7 years.

Claim.—The design for a stove, substantially as herein shown and described.

TRADE-MARKS

REGISTERED APRIL 26, 1898.

81,480. PHOTOGRAPHIC PRINTING-OUT PAPER AND PRINTS MADE THEREON. RESSEMBRAGH, MOREY & WILL COMPANY, Rochester, N. Y. Filed Mar. 2, 1898.

VELUTYPE

Essential feature.—The word "VELUTYPE." Used since November 15, 1897.

81,481. PHOTOGRAPHIC PRINTING-OUT PAPER. RESSEMBRAGH, MOREY & WILL COMPANY, Rochester, N. Y. Filed Mar. 2, 1898.

VICTOR

Essential feature.—The word "VICTOR." Used since May 15, 1897.

81,482. PHOTOGRAPHIC PRINTING-OUT PAPER. RESSEMBRAGH, MOREY & WILL COMPANY, Rochester, N. Y. Filed Mar. 2, 1898.

VERA

Essential feature.—The word "VERA." Used since May 15, 1897.

81,483. PAPER. HENRY LIEBMANN'S & SONS, New York, N. Y. Filed Feb. 26, 1898.

TRAFFIC

Essential feature.—The word "TRAFFIC." Used since July, 1897.

81,484. PERIODICALS. ARENA PUBLISHING COMPANY, New York, N. Y. Filed Jan. 31, 1898.

JUDGE'S · LIBRARY ·

Essential feature.—The words "JUDGE'S LIBRARY." Used since 1889.

81,485. PANTS, COATS, VESTS, AND OVERALLS. BRAY CLOTHING COMPANY, Louisville, Ky. Filed Nov. 19, 1897.

Essential feature.—The representation of a jackass in the attitude of braying. Used since January, 1897.

81,486. LEATHER BELTING. DETROIT OAK BELTING COMPANY, Detroit, Mich. Filed Feb. 26, 1898.

KING

Essential feature.—The word "KING." Used since April, 1898.

81,487. MEN'S SHIRTS. WOODWARD & BAILEY, New York, N. Y. Filed Feb. 26, 1898.

Defender

Essential feature.—The word "DEFENDER." Used since October 15, 1895.

81,488. CERTAIN ANTISEPTIC AND HEALING LOTION OR PREPARATION FOR THE SKIN. THEODORE H. BAYER, New York, N. Y. Filed Feb. 26, 1898.

BALM-ZOIN

Essential feature.—The compound word "BALM-ZOIN." Used since February 1, 1897.

81,489. PAINTS. LUCAS & SANFORD, New York, N. Y. Filed Feb. 26, 1898.

Toxanoy

Essential feature.—The word "TOXANOY." Used since September 15, 1897.

81,490. POLISHING AND DRESSING COMPOUNDS FOR LEATHER. I. D. SMITH & Co., Chicago, Ill. Filed Feb. 14, 1898.

Essential feature.—The representation of a single stem of clover and the letters "C. D. S." Used since January 15, 1897.

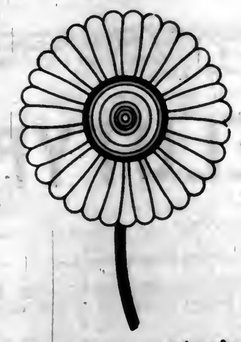
81,491. CHEWING-GUM. HARRY PEDER, New York, N. Y. Filed Feb. 3, 1898.

NERVO

Essential feature.—The word "NERVO." Used since January 17, 1898.

81,492. ALE, LAGER-BEER, AND PORTER. ALONZO G. VAN NOSTRAND, Boston, Mass. Filed Mar. 1, 1898.

P.B.



Essential feature.—The letters "P. B." Used since June, 1875.

81,498. WHISKY. MARTIN L. WOLF, Philadelphia, Pa. Filed Oct. 29, 1897.

Essential feature.—The signature of the registrant, "MARTIN L. WOLF." Used since August 17, 1897.

81,494. CRUMB HOME-MADE YEAST. SARAH A. YOST, Arkansas City, Kans. Filed Dec. 15, 1897.

Essential feature.—The representation of a sunflower. Used since January 30, 1892.

81,495. BICYCLES, TRICYCLES, VELOCIPEDES, AND PARTS THEREOF. THE BIRMINGHAM SMALL ARMS COMPANY, LIMITED, Birmingham, England. Filed Feb. 26, 1898.

B.S.A

Essential feature.—The letters "B. S. A." Used since 1894.

81,496. FOLDING BEDSTEADS. THE HALE & KILBURN MANUFACTURING COMPANY, Philadelphia, Pa. Filed Feb. 26, 1898.

Essential feature.—The pictorial representation of a telescope. Used since December, 1897.

THE NORRIS PETERS CO. PHOTO-LITH. WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE TYMESON AND BORLAND.

Decided March 17, 1898.

1. DIVISION—DIFFERENT PROCESSES—AGGREGATION.

Where the Examiner required division between a set of claims stated to be for the process of producing woven fabric and another set for the process of winding yarn and some of the claims of the first set included the step of winding yarn. *Held* that if the claims for producing the fabric, including the step of winding yarn, are for a legitimate combination division should not be required. If they are not for such a combination, they should be rejected for aggregation, leaving the question of division to be settled after the final determination of the question of aggregation. The practice announced in *ex parte Willcox and Borton*, (45 O. G., 455,) *ex parte Bullard*, (45 O. G., 1569,) and *ex parte Carter* (46 O. G., 1891) followed.

2. SAME—PROCESS—PRODUCT—APPARATUS.

A woven fabric, a process of producing the fabric and winding yarn, an apparatus for winding yarn on the spool, and a yarn-spool or bank-spool are each separate and independent inventions and should form the subject of separate applications.

ON petition.

ART AND MEANS FOR PRODUCING WOVEN FABRICS.

Application of Eugene Tymeson and Reuben Borland filed May 26, 1897, No. 638,216.

Messrs. Philipp, Phelps & Sawyer for the applicants.

DUELL, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring division.

The petitioners, after setting forth in their specification the nature and object of the invention, state:

The invention includes an improved fabric and improvement in the art of producing the same, a method of winding yarn for use in such art, a yarn-spool and a bank-spool as new articles of manufacture, and various features in winding apparatus, all of which will be fully described in the following specification and specifically pointed out in the claims.

The claims covering these improvements have been divided by the Examiner into four groups. Claims 1 to 6, which are for the improvement in the art of producing woven fabric, he puts in group 1; claims 7 to 10, for the method of winding yarn, in group 2; claims 11 to 13, for a woven fabric, in group 3, and claims 14 to 17, for a yarn-spool, and claims 18 to 21, for apparatus for winding yarn, in group 4.

An examination of claims 4, 5, and 6 shows that they include in one process the steps of weaving stated by claims 1, 2, and 3, and the steps of winding yarn stated by claims 7, 8, 9, and 10. If claims 4, 5, and 6 are for a legitimate combination, all of these claims should be included in one application. If, on the other hand, these claims are not for such a combination, they should be rejected for aggregations, and if the applicants acquiesce in this rejection or the Examiner's action is sustained on appeal claims 1, 2, and 3 should be made the subject of one application and claims 7, 8, 9, and 10 of another. The practice announced in *ex parte Willcox and Borton*, (45 O. G., 455,) *ex parte Bullard*, (45 O. G., 1569,) and *ex parte Carter*, (46 O. G., 1891,) should be followed.

The fabric covered by claims 11, 12, and 13 seems to be independent of the method covered by the preceding claims or the spool and apparatus of claims 14 to 21. These claims should, therefore, form the subject-matter of a separate application. While the Examiner has placed claims 14 to 21 in one group, I am of the opinion that the spools covered by claims 14 to 17 are independent of the apparatus covered by claims 18 to 21. The spools may be wound with yarn by other means than that covered by claims 18 to 21, or they may be wound by hand. Such spools are merchantable articles that may be placed on the market for use for other purposes than in such an apparatus as here described and claimed. The spools are also independent of the process or fabric of the other claims. Claims 18 to 21 cover winding apparatus that may be in one application.

Division on the line here indicated should be made. The petition is denied.

ROTH *v.* BROWN AND STILLMAN.

Decided February 25, 1898.

INTERFERENCE—MOTION TO DISSOLVE—RES ADJUDICATA—PRIOR SUIT IN COURT, EFFECT OF, ON OFFICE PROCEEDINGS.

Where it was moved to dissolve an interference for the reason that the question of the interference is *res adjudicata* as between the parties, that the question of priority having been determined by a court of competent jurisdiction could not be retried by the same parties in the Patent Office, and that one of the parties was estopped from asserting his right to the invention, *Held* that these questions should not be passed upon on an interlocutory motion, as they are such questions as relate to the merits of the interference and would more properly form the basis of a judgment of priority of invention than for the dissolution of the interference.

APPEAL on motion.

PNEUMATIC TIRES.

Application of Charles H. Roth filed July 8, 1893, No. 479,908. Patent granted Alexander T. Brown and Geo. F. Stillman December 20, 1892, No. 488,494.

Messrs. Philipp, Phelps & Sawyer for Roth.

Messrs. Kerr, Curtis & Page for Brown and Stillman.

GREELEY, *Assistant Commissioner:*

This is an appeal by the American Dunlop Tire Company, assignees of Brown and Stillman, from the decision of the Examiner of Interferences denying a motion to dissolve the above-entitled interference for the reason that the matter in issue is *res adjudicata* and that the parties in interest in behalf of Charles H. Roth, the New Brunswick Rubber Company, are estopped from asserting their rights to the invention as against the assignees of Brown and Stillman. The appellants also present a petition praying, among other things, that the Commissioner make an order dissolving the interference, or directing that it be dissolved, and rejecting the claim of Roth, or directing that it be rejected, upon the ground that the parties in interest in his behalf are estopped from asserting the same against the petitioners.

On July 17, 1896, the appellants presented a motion under Rule 122 that the interference be dissolved for the reason that Roth has no right to make the claim in issue and that he is estopped from asserting a claim of prior inventorship as against Brown and Stillman. This motion was duly transmitted to the Primary Examiner, who refused to dissolve the interference. The parties then proceeded to take testimony, and during the examination of Roth as a witness notice was given by the American Dunlop Tire Company that a motion would be made to dissolve the interference on the grounds here presented. After the close of Roth's testimony further taking of testimony was suspended by consent of counsel for the purpose of presenting to the Patent Office the motion now under consideration.

The motion was made by appellants and was heard by the Examiner of Interferences, who on June 8, 1897, rendered a decision denying the motion, substantially on the ground that consideration of the question by the Primary Examiner would involve the determination by him of the legal effect of a consent decree, and as this is a matter beyond his jurisdiction he refused to transmit the motion, under the authority of *Faure* v. *Bradley et al.*, (44 O. G., 945; C. D., 1888, 120,) holding that the grounds urged for dissolution may be presented at the hearing, as they would more properly form the basis of a judgment than for the dissolution of the interference.

It appears that on January 16, 1893, the American Dunlop Tire Company, as owners of the Brown and Stillman patent involved in this interference, filed a bill of complaint in the United States Circuit Court for the District of New Jersey against the Phelps & Dingle Manufacturing Company and Lucius J. Phelps, its president, for infringement of said Letters Patent. The defendants set up in their answer to the bill, among other defenses, that Brown and Stillman were not the first and original inventors of the matter in controversy, but that Charles H. Roth had previously invented and used the same. The complainant took proofs to support the bill, but the defendants failed to take any proofs. On motion of complainant a decree was entered, to which the defendants consented, decreeing, among other things, that claim 1 of Letters Patent to Brown and Stillman, the claim of the patent involved in this interference, is good and valid in law.

On July 1, 1893, during the pendency of this suit, the Phelps & Dingle Manufacturing Company, through an assignment, became the owner of the invention and the application of Roth involved in this interference, and continued as such owner up to and after this interference was declared. During the interference proceeding the Phelps & Dingle Manufacturing Company reassigned to Roth, who then assigned to the New Brunswick Rubber Company.

In view of these facts it is urged that the motion should be granted, for the reason that the question of the interference is *res adjudicata* as between the parties; that the question of priority of invention, which was essential to the finding of the decree and not a collateral question in the said suit, having been determined by a court of competent jurisdiction, could not be retried by the same defendants in the Patent Office; that Roth is the same defendant or was privy to the prior suit, so far as concerns any interest held by him at the time the interference was declared, because such interest was derived from the Phelps & Dingle Manufacturing Company, the defendant in that suit, during the pendency of the suit, and that he is now estopped from laying claim to prior inventorship.

The parties had a hearing before the Commissioner, and voluminous briefs have been presented in support of and against the motion, and while I have considered these briefs, yet, from the view I take of this case, it is not necessary at this stage to pass upon the questions raised by the motion, as they are such questions as relate to the merits of the interference and, as the Examiner of Interferences has held, would more properly form the basis of a judgment of priority of invention than for the dissolution of the interference.

In the case of *Ungar* v. *Saxlehner* (35 MS. Dec., 430) a motion was made to dissolve the interference on the ground that Ungar was estopped and bound by an award of priority in a former interference between Saxlehner and the P. Scherer Company. On appeal to the Commissioner from the decision of the Examiner of Interferences on said motion it was substantially held that this question related to the merits of the invention and the evidence of the estoppel went to establish the issue involved in the interference—namely, priority of invention; that on the final hearing on the question as to who is entitled to priority Saxlehner might have demanded an award of priority upon the conclusive effect of the prior determination; that if the interference were dissolved without determining the question of priority the applications involved would be restored to their original *ex parte* condition and the question of priority left

unsettled—in other words, that the Commissioner in the consideration of such an interlocutory motion is called upon to finally adjudge that Ungar was bound by the former adjudication and not entitled to an award of priority whereas such an adjudication by him should be had upon the merits only after the parties had taken evidence and submitted the case to the Examiner and appealed; that the party insisting upon the former adjudication could have introduced the record as evidence and relied upon that alone and demanded judgment, or he could in addition have taken evidence as to the actual priority; that in either event the case should have been submitted in the first instance to the Examiner of Interferences, and the defeated party could then have appealed upon the merits and the case have been properly tried before the Commissioner, and that the motion to dissolve the interference was not a proper method of presenting the question of former adjudication in such a case.

Although this case of *Ungar* v. *Saxlehner* was a trade-mark interference, I am of the opinion that the doctrine laid down therein applies equally as well to the case at bar and that this interference should not be dissolved, but should proceed to final determination on its merits.

In reaching this conclusion I have not overlooked the argument advanced by appellants that an interference between an applicant and a patentee should be dissolved without judgment of priority whenever it appears that the applicant is for any cause not entitled to a patent.

The decision of the Examiner of Interferences in denying the motion to dissolve is therefore affirmed, and the petition is dismissed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

WELSBACH LIGHT COMPANY v. THE SUNLIGHT INCANDESCENT GAS LAMP COMPANY.

Decided March 24, 1898.

RAWSON—PRODUCTION OF INCANDESCENT MANTLES—PIONEER INVENTION—INFRINGEMENT.

Claim 1 of Letters Patent No. 407,963, granted July 30, 1889, to Frederick L. and William S. Rawson, for the production of incandescent mantles, consisting in coating the complete mantle with paraffin or other suitable material, construed, *Held* to be for a pioneer invention and infringed by a process consisting in coating with a solution of collodion.

Mr. William Findlay Brown and *Mr. John R. Bennett* for the complainant.

Mr. Charles G. Coe for the defendant.

TOWNSEND, *J.:*

The questions herein presented at final hearing on bill and answer relate to the first claim of Patent No. 407 963, granted July 30, 1889, to Frederick Lawrence Rawson and William Stepney Rawson, for "Production of incandescent mantles" and assigned to complainant.

Prior to the discussion of the issues directly involved it will be necessary to briefly describe the Welsbach light.

In 1885 Dr. Carl Auer von Welsbach discovered or invented the mantle of the incandescent light which bears his name. Prior to that date it was known that certain rare earths when heated to incandescence were possessed of great luminosity. Dr. Auer von Welsbach, or, as he will hereinafter be called, "Welsbach," was the first to discover that by immersing a textile fabric in a solution of the salts of said rare earths and afterward applying heat and consuming the fabric the earthy salts would be left in a coherent condition, exactly reproducing the fabric consumed and capable of emitting the intense white Welsbach incandescent light. Great as was this scientific discovery it was commercially valueless. The resultant product was so light and fragile that although, as stated by the inventor, "it would remain effective as an illuminant for hundreds of hours" it would crumble to ashes if handled or even touched by a hard body.

In their specification the patentees, after speaking of the difficulty previously found in transporting these mantles without breakage, say:

> This difficulty our invention is designed to overcome by dipping the mantles, after they have been given their proper shape, into a liquid which will thoroughly penetrate the pores of the material and will afterward set to such a degree of hardness as to protect the material from danger of breakage in packing or handling, and which can afterward be removed without mechanical injury to the mantles or without leaving any objectionable residue.

The claim in suit is as follows:

> 1. The herein-described improvement in strengthening incandescent mantles, consisting in coating the completed mantle with paraffin or other suitable material, substantially as set forth.

The defenses are invalidity for lack of invention and denial of infringement.

Bright's British patent, No. 12,305, granted in 1848, for "Improvements in lamps, wicks, and covers for vessels for holding oil and other fluids," *inter alia*, describes a method of "manufacturing hollow cylindrical wicks in a stiffened state" to permit of their easy insertion into the lamp-burner "by inserting into them paper cases * * * or by dipping them (not partially but wholly) in wax or in any other suitable stiffening matter." It has not the same purpose nor mode of operation as the patent in suit and does not anticipate it.

Gwynne patent, No. 52,788, issued in 1866, for an "Improved process for saturating wood, cloth, paper, etc., with paraffin," and Toppan patent, No. 89,005, for "Improved water-repellent material," may be considered together. The patentee Gwynne says that—

> when the paraffin is thus combined with the substances they seem together to form a new substance inasmuch as it cannot be again expelled,

and that substances thus saturated acquire—

> greatly-increased tenacity, toughness, power of endurance and of resistance to the action of the elements.

Toppan describes a similar treatment with a solution of paraffin. Each of these patents describes a process for making wood, paper, and cloth waterproof by permanently combining them with paraffin. Neither of them attempts to effect the object of the Rawson patent; but defendant relies chiefly upon Patent No. 261,529, issued July 25, 1882, to Charles Clamond, for "Means and apparatus for

producing intense white light." Figure 9 of the drawings shows a burner composed of magnesian threads. These threads are made by forcing a wet plastic material through dies. While thus wet they are shaped into the form of a cone, which is then dried and baked. The resultant product is a fragile porcelain-like shell or basket of refractory material capable of use with a gas-burner to produce an incandescent light. In connection with this basket the patentee used small rods formed of the same material. It was not claimed that there was anything novel in Clamond's magnesium light which is relevant herein; but defendant contends that—

this patent shows that the strengthening of such fragile refractory cones to protect them against breakage in transporting and handling was not new.

This contention is founded upon the following statement in Clamond's specification:

The basket may be cased over with paper or other combustible material, so as to strengthen it for transport and handling, this casing being burned away when the jet is ignited.

In this chief reliance of defendant I find nothing to detract from the merit of the patented invention. There was no strengthening treatment of a refractory material having the form of a textile fabric, no combination with another substance by saturation in a protecting solution, and no process of hardening the protecting solution. In short, Clamond merely proposed to wrap up his porcelain cone in a piece of paper which would burn off when the cone was placed over a lighted flame. He protected his shell by an ordinary external wrapper, which could be removed in the ordinary way, leaving the shell as before. By the Rawson process the solution so penetrated the interstices of the Welsbach fabric that it became an integral part thereof.

But the expert and counsel for defendant claim that—

all the Rawsons have done is to apply the old Gwynne process of dipping porous articles into hot melted paraffin, or the Topan process of dipping porous articles in paraffin solutions with a volatile hydrocarbon, such as benzin or naphtha, without any difference in their mode of application, or the result obtained therefrom, to the old purpose of protecting fragile mineral cones in transport and handling set forth by Clamond.

I cannot assent to this proposition. The Clamond protecting-wrapper is not even remotely allied to the Rawson strengthening process. The result of the latter is new, distinct, and strikingly unexpected. To introduce these processes in this new art and to work out and apply the undeveloped possibilities of this use of paraffin in solution in connection with these earths, so as to place this light within the reach of the general public, was a most meritorious invention. Defendant says it does not infringe because it does not coat its mantles with paraffin or any of the equivalents mentioned in complainant's patent and relies upon certain limitations claimed to be disclosed by the file-wrapper.

After describing the use of paraffin in the specification it is there set forth that—

other materials may be employed as long as they set hard at ordinary temperatures and burn away without mechanical destruction to the mantle and without leaving any residue which would injure the light-giving properties of the mantle.

The Examiner required the patentee to insert a specific statement as to what other materials are used, and the following was thereupon added:

The materials referred to as being capable of use in lieu of paraffin may be any solid hydrocarbon of a high boiling-point and many resins and gums soluble in spirit, such as alcohol, etc. Shellac will serve the same purpose, but not quite as advantageously

The defendant insists that the patent cannot be infringed by the use of any materials other than those thus specified.

It is admitted—

that the defendant corporation herein has * * * and still is coating completed incandescent mantles or hoods for the purpose of strengthening them for purposes of transport and handling by dipping or immersing them in a solution composed chiefly of collodion with the addition of a small percentage of castor-oil, and in excess of five per cent. That such solution is a liquid which, after the mantle or hood is coated therewith by dipping or immersing said hood in such solution will afterward set at ordinary temperatures to such a degree of hardness as to strengthen the mantle or hood for the purpose of preventing breakage in transport and handling and of such a character that it can afterward be removed by burning away, without mechanical destruction to the mantle and without leaving any residue which would injure the light-giving properties of the mantle or hood.

Complainant contends that this collodion solution is included under the words "paraffin or other suitable material, substantially as set forth," in the first claim, notwithstanding the enumeration of equivalents in the patent.

The invention of the patent in suit transformed the Welsbach mantle from a laboratory experiment into an article of commerce. That it has successfully overcome the obstacles previously encountered and has accomplished results quite as important as the original Welsbach invention is admitted. The evidence as to Welsbach's understanding of the limitations upon the practical use of his light, and the graphic illustration at the hearing herein of the bold and unique treatment of the fragile mantle, and the success of the adaptations employed in producing the desired results, indicate not only the presence of inventive genius, but claim for the invention the rank of a pioneer.

For these reasons this patent should not be narrowly interpreted, but should be so construed as to cover a broad range of equivalents.

The undisputed testimony of Drs. Chandler and Morton shows that it was well known at the date of this invention that such a collodion solution would operate in the same way as a paraffin or shellac solution in the treatment of such substances and was therefore an "other suitable material." That in every other respect the defendant has appropriated the patented process appears from his admission. While collodion is not chemically an equivalent of a hydrocarbon resin gum and is not paraffin or shellac, it performs the same functions in the same manner and with the same result.

A patentee is not obliged in his specification to state all the known equivalents of the materials used by him. It is the patent as finally issued which the court is to construe and upon which the patentee must stand. In this case the patentees have claimed "paraffin or other suitable material, substantially as set forth." They have set forth that "other materials may be employed as long as they set hard at ordinary temperatures and burn away without mechanical destruction to the mantle." The defendant uses a suitable material known at the date of the invention to have all these properties and characteristics, and has thereby appropriated complainant's product.

Let a decree be entered for an injunction and an accounting.

U. S. Circuit Court of Appeals—Second Circuit.

THOMSON-HOUSTON ELECTRIC COMPANY *v.* UNION RAILWAY COMPANY *et al.*

Decided April 7, 1898.

VAN DEPOELE—ELECTRIC RAILWAY, TRAVELING CONTACT FOR—VOID—PREVIOUSLY PATENTED TO SAME INVENTOR.

Claims 2 and 4 of Letters Patent No. 495,443, for a traveling contact for electric railways, granted April 11, 1893, to the administrators of Charles A. Van Depoele, construed and *Held* to be void, as they are for the same invention which has been previously patented to the same inventor in Letters Patent No. 424,695.

Mr. William H. Kenyon and *Mr. Charles E. Mitchell* for the appellant.

Mr. Frederick H. Betts for the appellees.

PER CURIAM:

This appeal involves the question whether claims 2 and 4 of Letters Patent No. 495,443, for a "traveling contact for electric railways," granted April 11, 1893, to the administrators of Charles A. Van Depoele, assignors to the complainant, are void, because they are for the same inventions which had been previously patented in Letters Patent No. 424,695. The invention, to adopt the language of an expert witness for the complainant in a former suit brought upon the patent—

consists generally in an electric railway, having an overhead conductor, and a car for said railway provided with a contact device carried by the car so as to form a unitary structure therewith, and consisting of a trailing arm hinged and pivoted to the car so as to bridge the space between it and the conductor, and move freely both laterally and vertically, and said arm carrying at its outer end a contact device capable of being pressed upward by a suitable tension device into engagement with the under side of the conductor.

The essential features of construction involve the location of the supply-conductor above the track and line of travel of the car and contact with its under side, the arrangement of the contact device on a trailing arm, and the maintenance of a constant upward pressure by means of a tension device operating upon a hinged arm. The two claims in controversy are:

2. The combination of a car, an overhead conductor above the car, a contact device making underneath contact with the conductor, and an arm carried by the car and carrying the contact device, and pivoted so as to swing freely around a vertical axis.

4. The combination of a car, an overhead conductor above the car, a contact device making underneath contact with the conductor, and an arm on the car movable on both a vertical and a transverse axis and carrying the contact device.

The patent contains sixteen claims. The characteristics of the invention and the scope and validity of many of the claims were considered by this court in *Thomson-Houston Electric Company v. Hoosick Railway Company*, (82 Fed. Rep., 461; 80 O. G., 967,) where we held that claims 6, 7, 8, 12, and 16 were for the same inventions which had been previously patented, and a reference to the opinion in that case will dispense with the necessity for any extended discussion now. Referring to some of those claims we said:

It would be a waste of time to dwell upon the verbal differences in these claims. The changes in phraseology import nothing of substance into their respective combinations. They describe the same thing in different language.

It is insisted for the appellants that the two claims now in controversy are for the same combinations specified in some of the claims which were then held to be void. The appellee contends that they are not, because they omit to specify any means for holding the contact device in underneath contact with a conductor, and consequently can be construed as covering a subcombination in which such means are not employed, or if such means must be read into the claims by implication the claims are not limited to the means described in the specification, and that upon either construction they are not the claims of the earlier patent. The court below adopted this view. If the appellants are right, no other question need be considered. It will be seen that these claims are for identical combinations, except that the arm is differentiated in each by functional characteristics. The specification describes a traveling arm carried by a post on top of the car—

which is hinged and should in most instances be also pivoted to the top of the post, although a reasonable amount of looseness in the hinged joint will answer the purpose of the pivot.

When pivoted, "it swings freely around a vertical axis" and meets the terms of claim 2. When hinged and loosely jointed, it is "movable on both a vertical and transverse axis" and meets the terms of claim 4. We do not entertain any doubt that there must be incorporated into these claims, by implication, means for maintaining the contact device and the conductor in their normal working relations. Without them there is really no "traveling" contact device and no operative combination, and the claims would cover merely an aggregation of devices which do not coact unless assisted by some instrumentality which must be discovered and supplied. The function of the arm as constructed and arranged is to establish "moving contact" while maintaining a positive mechanical connection between the vehicle and the conductor. It was devised because as previously mounted the contact device was found to be deficient in capacity to follow the sinuosities and deflections of the conductor while the car was in motion. It can only perform this function by the aid of some instrumentality which holds it constantly in the proper relations to bridge the space between the car and the conductor and keep the contact device and the conductor in electrical connection. As pointed out in the specification, this consists of a tension device operating upon the arm and maintaining a constant upward pressure, thus holding the contact device to the conductor. This tension device or its equivalent is an indispensable element of the respective combinations.

That the proper construction of the claims is as thus indicated is evidenced by the proceedings upon interference in the Patent Office. Claim 2 is a literal statement of the issue defined and formulated by the Patent Office between what was then claim 1 of the application and the claims of two interfering applications. Claim 1 was as follows:

In an electric railway, the combination with a suitable contact and the supply-conductor suspended above the track, of a car provided with a swinging arm carrying a contact device in its outer extremity and means for imparting upward pressure to the outer portion of the arm and contact, to hold the latter in continuous working relation with the under side of the supply-conductor substantially as described.

In formulating the issue the Office omitted as unnecessary, because necessarily implied, the elements enumerated in claim 1 of the application which are not enumerated in claim 2 of the patent.

One of these elements was "means for imparting upward pressure to the outer portion of the arm and contact." This element was apparently thought to be as indispensable to the operativeness of the combination of the claim as was "a suitable track," an element also omitted.

The appellee concedes that the claims are for combinations specified in other claims of the patent, which by our former decision were held to be void if they require the construction which we have placed upon them. Indeed, claim 6, which we held to be void, is identical in terms with claim 1 of the interference proceedings, the claim which the Patent Office regarded as embodying the invention covered by present claim 2. The rule of construction which usually obtains, whereby the several claims of a patent are to be differentiated, so that effect may be given each, cannot be reasonably invoked in behalf of this patent, where so many of the claims are duplicated.

The order granting a preliminary injunction is reversed.

JAPAN.

PATENTS, DESIGNS, AND TRADE-MARKS.

The following treaty is republished from THE OFFICIAL GAZETTE *of March 16, 1897, together with the sections of the former treaty affected by it, as full information in regard to the rights of American citizens to procure Japanese patents.*

Convention Between the United States of America and the Empire of Japan.

PATENTS, TRADE-MARKS, AND DESIGNS.

Concluded at Washington January 13, 1897.
Ratification advised by the Senate February 1, 1897.
Ratified by the President February 2, 1897.
Ratified by the Emperor March 6, 1897.
Ratifications exchanged at Tokyo March 8, 1897.
Proclaimed March 9, 1897.

BY THE PRESIDENT OF THE UNITED STATES OF AMERICA.

A PROCLAMATION.

Whereas a Convention between the United States of America and the Empire of Japan securing immediate reciprocal protection for patents, trade-marks and designs, was concluded and signed by their respective plenipotentiaries at the city of Washington on the thirteenth day of January, one thousand eight hundred and ninety-seven, the original of which Convention being in the English language is word for word as follows:

The President of the United States of America and His Majesty the Emperor of Japan, being desirous of securing immediate reciprocal protection for patents, trade-marks and designs, have resolved to conclude a Convention for that purpose, and have appointed as their plenipotentiaries:

The President of the United States, the Honorable Richard Olney, Secretary of State of the United States; and His Majesty the Emperor of Japan, Toru Hoshi, Jushii, His Majesty's Envoy Extraordinary and Minister Plenipotentiary near the Government of the United States;

Who, after having communicated to each other their respective full powers, found in good and due form, have agreed as follows:

Article XVI of the Treaty of Commerce and Navigation between the United States of America and Japan concluded at Washington on the twenty-second day, the eleventh month, the twenty-seventh year of Meiji, corresponding to the twenty-second day of November, eighteen hundred and ninety-four of the Christian era, shall have full force and effect from the date of the exchange of ratifications of this Convention.

The present Convention shall be duly ratified by the President of the United States of America, by and with the advice and consent of the Senate thereof, and by His Majesty the Emperor of Japan in the usual manner; and the ratifications shall be exchanged at Tokyo as soon as possible.

In witness whereof, the respective plenipotentiaries have signed this Convention and have thereunto affixed their seals.

Done, in duplicate original, at Washington, this thirteenth day of January in the one thousand eight hundred and ninety-seventh year of the Christian era.

RICHARD OLNEY. [SEAL.]
TORU HOSHI. [SEAL.]

And whereas the said Convention has been duly ratified on both parts, and the ratifications of the two Governments were exchanged at Tokyo on the eighth day of March, one thousand eight hundred and ninety-seven;

Now, therefore, be it known that I, William McKinley, President of the United States of America, have caused the said Convention to be made public, to the end that the same and every clause thereof may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the city of Washington this ninth day of March in the year of our Lord one thousand eight hundred and [SEAL] ninety-seven and of the Independence of the United States the one hundred and twenty-first.

WILLIAM McKINLEY.

By the President:
JOHN SHERMAN,
Secretary of State.

Extracts from a Treaty concluded between the Governments of Japan and the United States November 22, 1894.

ARTICLE XVI.

The citizens or subjects of each of the high contracting parties shall enjoy in the territories of the other the same protection as native citizens or subjects in regard to patents, trade-marks and designs, upon the fulfillment of the formalities prescribed by law.

ARTICLE XIX.

This Treaty shall go into operation on the 17th day of July, 1899, and shall remain in force twelve years from that date.

Either high contracting party shall have the right, at any time thereafter to give notice to the other of its intention to terminate the same, and at the expiration of twelve months after such notice is given this Treaty shall wholly cease and determine.

Regulations in Relation to Mail-Matter.

In order to insure the ready identification of the division from which mail-matter emanating from this Office was sent, and the prepayment of any foreign postage thereon, as well as to prevent the retention for general delivery in the post-office of this city of any wrongly-addressed letter when this Office could supply a fuller or more accurate address, it is directed that the following regulations be observed with reference to all mail-matter forwarded from this Office:

Each envelop forwarded from any division will be stamped or marked in the upper left-hand corner with the division number or letter, as the case may be.

Each envelop addressed to a foreign country must be forwarded to the mail-room and the proper stamps affixed thereto before mailing.

Such mail as is to be delivered in this city shall be directed "Washington, D. C." If a letter addressed to a person in this city and not marked for general delivery be returned to this Office, it will be promptly remailed with an accurate and full local address supplied, if possible. In remailing, the envelop should be marked or stamped "Hold in General Delivery," but no envelop should be thus marked until the address thereon is as full and accurate as the Office can supply. A letter to a person in this city will not be filed "Undelivered" until it is returned to this Office in an envelop thus addressed and marked.

Oaths of Applicants in Foreign Countries.

It is hereby directed that oaths accompanying applications for patents made within the following-named foreign countries must be taken before a minister, chargé d'affaires, consul, or commercial agent holding commission under the Government of the United States:

Austria-Hungary.
Argentine Republic.
Belgium.
Brazil.
Costa Rica.
Denmark.
Haiti.
Honduras.
Italy.
Mexico.
Netherlands.
Norway.
Peru.
Portugal.
Russia.
San Salvador.
Servia.
Sweden.
Switzerland.

Applications filed in this Office presenting oaths not executed in compliance with this order will be treated as incomplete.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Price of Printed Copies of Specifications and Drawings.

It is hereby ordered, pursuant to an amendment of section 498 of the Revised Statutes, entitled "An act amending the statutes relating to the sale of printed copies of patents," approved May 19, 1898, that the price to be paid for uncertified printed copies of specifications and drawings of patents shall be, for single copies, or any number of unclassified copies, five cents each; for copies by subclasses, three cents each; by classes, two cents each, and for the entire set of patents issued, in one order, one cent each.

This order will be in effect on and after July 1, 1898.

Money by Mail.

Money sent by mail to the Patent Office will be at the risk of the sender. Letters containing money should be registered.

CERTIFICATES OF REGISTRATION ISSUED MAY 3, 1898.

PATENTS

GRANTED MAY 3, 1898.

603,243. BUNG FOR ALE-BARRELS. FREDERICK W. ALBRIGHT, Jr., Brooklyn, N. Y. Filed Nov. 11, 1897. Serial No. 658,144. (No model.)

Claim.—1. In a barrel-bung, the combination of a metal support arranged to be secured to the barrel, a spherical valve-seat provided with a port or opening, a spherical rotary valve arranged to open and close the port, a support therefor located on the side of the valve-seat opposite the actuating device, the arrangement of the support being such that no portion of it projects through the valve and an actuating device for imparting a rotary movement to the valve.

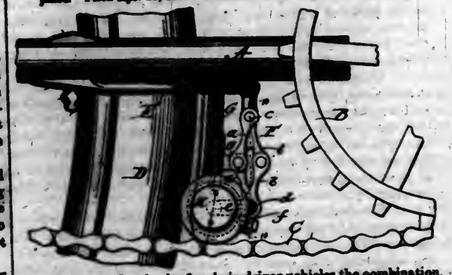
2. In a barrel-bung, the combination of a metal support arranged to be secured to the barrel, a spherical valve-seat, a self-centering spherical valve, a spring situated outside of the working parts of the valve forcing the valve against the seat, and an actuator arranged to impart a rotary motion to the valve, so arranged that it does not project through the valve.

3. In a barrel-bung, the combination of a screw-threaded plug which is secured to the barrel, a ground spherical valve-seat screw-threaded to the plug, a self-centering spherical valve, a strainer secured to the plug, and a spring located between the strainer and valve for holding the valve in place.

4. In a barrel-bung, the combination of a screw-threaded plug, a valve-seat provided with flat and spherical faces, disk and spherical valves, a clamping-ring for holding the disk-valve in place, a spring-support for the spherical valve, and an actuating device.

5. In a barrel-bung, the combination of a screw-threaded plug, a spherical valve-seat, a spherical valve mounted for rotary movement, a socket in the curved side of the valve, and an actuator which passes through the valve-seat and enters the socket in the valve.

6. In a barrel-bung, the combination of a screw-threaded plug, a valve-seat screw-threaded to the plug and provided with flat and spherical surfaces, ports in the valve-seat, disk and spherical valves, a socket in the spherical valve, a plug on the disk entering the socket, a spherical strainer screw threaded to the valve-seat, and a compression-spring which supports the spherical valve in place and permits it to automatically adjust itself.



603,244. FLUSH JOINT FOR TUBULAR-FRAME CONSTRUCTIONS. FREDERICK C. AVERY, Toledo, Ohio. Filed June 26, 1897. Serial No. 642,663. (No model.)

Claim.—1. A flush joint for the angular connection of tubing consisting of a receiving member having a continuous circular kerfed seat cut entirely through the cylindrical side of the tube at two opposite points, and having grooved but uncut bridge-pieces at intermediate points; in combination with the tubular entering member having its end inserted throughout its entire circumference into the circular kerfed seat of the receiving member substantially as and for the purpose described.

2. A flush joint for the angular connection of tubing consisting of a receiving member having a continuous circular kerfed seat cut entirely through the cylindrical side of the tube at two opposite points, and having uncut bridge-pieces at intermediate points with acute angular grooves in them; in combination with the tubular entering member having its end beveled upon the inner side and inserted throughout its entire circumference into the circular kerfed seat of the receiving member substantially as and for the purpose described.

603,245. AUTOMATIC VEHICLE-BRAKE. HERBERT I. BAILEY, Chicago, Ill., assignor to the Bailey Manufacturing Company, same place. Filed Apr. 28, 1897. Serial No. 634,501. (No model.)

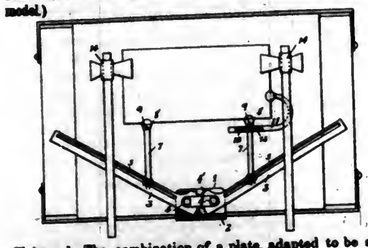
Claim.—1. In a brake for chain-driven vehicles the combination, with a toggle pivoted, at one end, to the vehicle-frame and arranged to be engaged, at its free end, by the driving-chain, of a brake-spoon secured to the toggle between its ends, substantially as described.

2. In a brake for chain-driven vehicles the combination, with a toggle pivoted, at one end, to the vehicle-frame and arranged to be engaged, at its free end, by the driving-chain, of a brake-spoon loosely mounted on the pivot connecting the toggle-arms, substantially as described.

3. In a brake for chain-driven vehicles the combination, with a toggle pivoted at one end to the vehicle-frame and a chain-engaging device adjustably secured to the free end of the toggle, of a brake-spoon secured to the toggle between its ends, substantially as described.

4. In a brake for chain-driven vehicles the combination, with a toggle pivoted at one end to the vehicle-frame and a chain-engaging device adjustably secured to the free end of the toggle, of a brake-spoon loosely mounted on the pivot connecting the toggle-arms, substantially as described.

5. In a brake for chain-driven vehicles the combination, with a toggle pivoted at one end to the vehicle-frame and a chain-engaging device secured to the free end of the toggle and vertically as well as horizontally adjustable thereon, of a brake-spoon secured to the toggle between its ends, substantially as described.



6. In a brake for chain-driven vehicles the combination, with a pair of toggles pivoted, at one end, to each other and to the vehicle-frame and, at their free ends, pivoted together and arranged to be engaged by the driving-chain, of a brake-spoon secured to one of said toggles between its ends, substantially as described.

7. In a brake for chain-driven vehicles the combination, with a pair of toggles adjustably pivoted, at one end, to each other and adjustably pivoted to the vehicle-frame and a chain-engaging device adjustably secured to the free ends of said toggles, of a brake-spoon secured to one of said toggles between its ends, substantially as described.

8. In a brake for chain-driven vehicles the combination, with a pair of toggles pivoted, at one end, to each other and adjustably pivoted to the vehicle-frame and a chain-engaging device adjustably secured to the free ends of said toggles, one arm of one of said toggles being rigid, of a brake-spoon secured to the other of said toggles between its ends, substantially as described.

9. In a brake for chain-driven vehicles the combination, with a toggle pivoted, at one end, to the vehicle-frame and arranged to be engaged, at its free end, by the driving-chain, of a brake-spoon secured to the toggle between its ends, and a spring bearing upon said toggle for normally holding the spoon out of contact with the wheel-tire, substantially as described.

603,246. FEED-GAGE FOR PRINTING-PRESSES. CLEMENT H. BALDING, Holton, Kans. Filed June 12, 1897. Serial No. 640,564. (No model.)

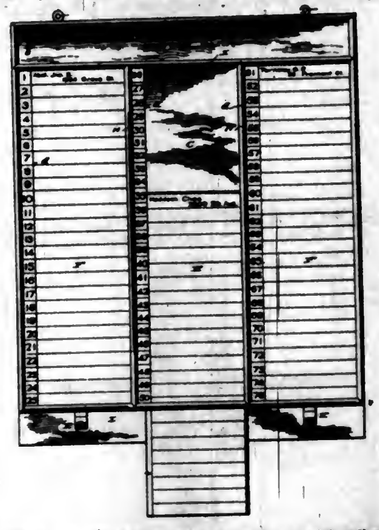
Claim.—1. The combination of a plate, adapted to be secured to the platen of a press, arms pivoted thereto, and carrying intermeshing cogs on their inner ends, secondary arms adjustable on said arms, and a marginal gage adjustable upon one of said secondary arms, substantially as set forth.

2. The combination of a plate having a flange which is adapted to be secured by the clamp of the platen, arms pivoted to the plate, and carrying intermeshing cogs on their inner ends; said arms having longitudinal slots, secondary arms adjustable in said slots, securing means carried by the outer ends of said secondary arms whereby they are attached to the tympan, seats formed upon the upper ends of said arms against which the sheet to be printed is adapted to rest, substantially as set forth.

3. The combination of a plate having a flange which is adapted to be secured by the clamp of the press, arms pivoted to said plate and carrying intermeshing cogs on their inner ends, said arms having longitudinal slots, secondary arms adjustable in said slots, securing means carried by the outer ends of the said secondary arms whereby they are attached to the tympan, seats formed on the upper ends of said arms against which the edge of the material is adapted to rest, whereby it is supported at the desired height, and a marginal gage adjustable on one of said secondary arms, substantially as set forth.

4. The combination of arms secured to the platen of a press and adjustable thereon, secondary arms adjustable upon the first-named arms, a marginal gage adjustable upon one of said secondary arms, plates adapted to be positioned upon the gripper-fingers of the press, and laterally-extending arms carried by said plates, said arms being bulged outwardly from the plates, so as to grip the opposite sides of the paper without interfering with the gage, substantially as set forth.

603,247. KEY-HOLDER. FREDERICK W. BECKER, Newark, N. J. Filed Jan. 3, 1898. Serial No. 666,080. (No model.)



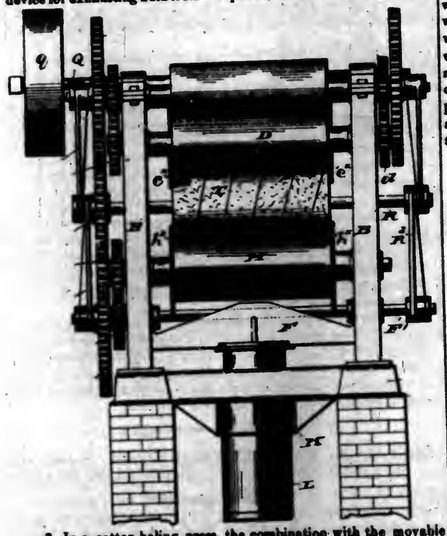
Claim.—1. A split ring, the convolutions of which lie closely together throughout the greater portion of their length, but separated at one or more points away from the free ends thereof, substantially as shown and described.

2. A key-holder composed of a single piece of wire the two ends of which overlap, the overlapping portions lying closely together at the tips or ends of the wire, but separated at a point between said tips or ends, substantially as and for the purposes described.

3. A key-holder composed of a single piece of wire bent to form two or more convolutions which lie closely together throughout the greater portion of their length, but separated at one or more points away from the free ends of the wire, substantially as and for the purposes described.

603,248. BULLETIN-BOARD. WILLIAM H. BENSON, Kansas City, Mo. Filed Jan. 24, 1896. Serial No. 576,696. (No model.)

Claim.—1. The bulletin-board herein shown and described comprising the stationary frame having a closed back, parallel guide-strips *c* fixed to said back and within the frame, number-plates attached to the guide-strips and inscribed with columns of figures in consecutive order, glass front or fronts fastened to said stationary frame and the guide-strips by suitable devices, a series of vertically-slidable cases confined edgewise between the guide-strips and laterally between the back and number plates, and name-slips removably fitted in said cases, a series of such name-slips being provided for each case and each slip arranged in alinement with one figure in a column on one number-plate, all arranged and combined for service as set forth.



2. A bulletin-board comprising a back, a series of guide-strips attached thereto, a series of number-plates of greater width than the guide-strips and fastened to the latter to project beyond the edges thereof and serving, in connection with the back, to confine the sliding cases against lateral displacement, and the glass-front panes fastened to the number-plates, combined with a series of slidable cases fitted edgewise between the guide-strips and laterally between the back and the projecting edges of the number-plates, and name slips or cards fitted in the slidable cases, substantially as described.

3. A bulletin-board comprising a back, a series of guide-strips attached thereto, a series of number-plates of greater width than the guide-strips and projecting, at their edges, beyond the same to serve in connection with the back as guides to confine slidable cases against lateral displacement, the glass-front panes arranged over the number-plates, the molding-strips applied over the edges of the glass-front panes, and the fasteners passed between the edges of the glass-front panes and holding the moldings, the glass panes, and the number-plates on the back, combined with a series of slidable cases fitted edgewise between the guide-strips and laterally between the back and the projecting edges of the number-plates, means for locking said cases in a detachable vertical position, and removable cards or slips carried by the slidable cases, substantially as described.

603,249. BALING-PRESS. CHARLES L. BENNERETTE, Waco, Tex. Filed Mar. 9, 1896. Serial No. 582,422. (No model.)

Claim.—1. In a cotton-baling press the combination with the stationary compressing-rollers, of movable compressing-rollers, each disposed diametrically opposite with respect to the bale to one of said fixed rollers, of a hydraulic cylinder, a hollow piston in said cylinder operatively connected with said movable rollers having a communication between said cylinder and the interior of said piston, means for forcing air into said piston, and automatic devices for exhausting the air from the interior of said piston, substantially as described.

2. In a cotton-baling press, the combination with the movable and stationary compressing-rollers, of a hydraulic cylinder, a hollow piston in said cylinder for moving the movable compressing-rolls, having a communication between the interior of said piston and said cylinder, means for forcing a fluid into said piston and an automatic device for exhausting fluid from said piston, substantially as described.

3. In a cotton-baling press, the combination with the movable and stationary compressing-rollers, of a hydraulic cylinder, a hollow piston engaging said cylinder and having an aperture forming a communication between the interior of said piston and cylinder, a regulating-valve for said aperture, means for forcing a fluid in said piston and an automatic relief-valve for said piston, substantially as described.

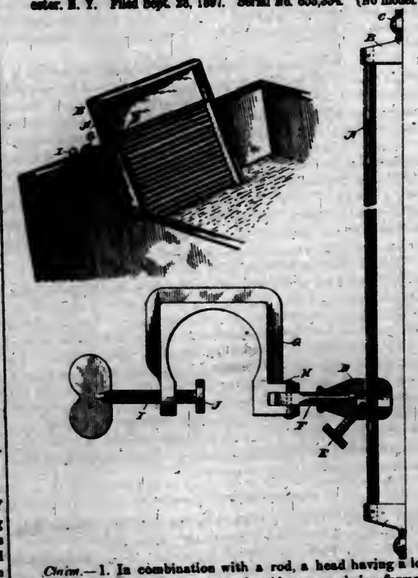
603,250. PROCESS OF BALING COTTON. CHARLES L. BENNERETTE, Waco, Tex. Filed Mar. 9, 1896. Serial No. 582,423. (No specimens.)

Claim.—1. The herein-described process of baling cotton, which consists in first forming a bat, then forming a loosely-wound cushion-core from the bat, then compressing the cushion-core by winding the bat about the cushion-core in true helical form, under great pressure, to form binding-laps, then winding on the bat to form a substantial number of outer laps under reduced pressure, substantially as described.

2. As a new article of manufacture, a cotton-bale consisting of a compressed cushion-core, surrounded by greatly-compressed binding-laps of true helical form, said binding-laps being surrounded by a substantial number of less tightly wound helical laps, substantially as described.

603,251. ADVERTISING OR SIGN LAMP. SHANKER A. BUDE, Bombay, India. Filed May 27, 1897. Serial No. 638,477. (No model.)

Claim.—1. An advertising or sign lamp, provided with an outer stationary casing, and an inner revoluble casing said outer casing being provided with signs or advertisements, the words of which are cut therein, in vertical lines, and said inner casing being provided with a vertical row of colored transparent or translucent panels or panes which correspond with the number of the words in each sign, and with an equal number of transparent or translucent panels or panes arranged in the same circumferential line but diagonally of said casing, substantially as shown and described.

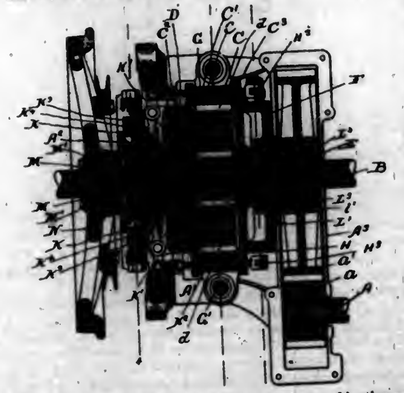


2. An advertising or sign lamp, comprising an outer cylindrical stationary casing, provided with a plurality of signs, the words of which are cut in vertical lines therein, and an inner revoluble casing which is provided with a vertical row of colored panels or panes which equal in number the words in each sign or advertisement, and with a diagonal row of colored panes or panels which also equal in number the words of each sign, substantially as shown and described.

3. An advertising or sign lamp, comprising an outer cylindrical stationary casing, provided with a plurality of signs, the words of which are cut in vertical lines therein, and an inner revoluble casing which is provided with a vertical row of colored panels or panes which equal in number the words in each sign or advertisement, and with a diagonal row of colored panes or panels which also equal in number the words of each sign, said inner revoluble casing being pivotally supported and provided at the upper end thereof, with propeller-fans which are formed integrally therewith, and which are adapted to be operated by the heated gases or products of combustion, substantially as shown and described.

4. An advertising or sign lamp, comprising an outer cylindrical stationary casing, provided with a plurality of signs, the words of which are cut in vertical lines therein, and an inner revolubie casing which is provided with a vertical row of colored panels or panes which equal in number the words in each sign or advertisement, and with a diagonal row of colored panes or panels which also equal in number the words of each sign, said inner revoluble casing being pivotally supported and provided at the upper end thereof, with propeller-fans which are formed integrally therewith, and which are adapted to be operated by the heated gases or products of combustion, and means for supporting a candle or other illuminating-sign in the bottom of the revoluble casing, substantially as shown and described.

603,252. WASHBOARD-FASTENER. HENRY S. BRIGGS, Rochester, N. Y. Filed Sept. 28, 1897. Serial No. 653,334. (No model.)

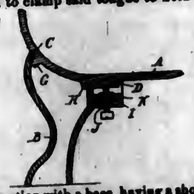


Claim.—1. In combination with a rod, a head having a longitudinal passage formed therethrough said passage being formed in

two sizes whereby a shoulder is produced, a spindle having a head formed thereon, said spindle having its body fitted in the small-sized portion of the passage and the head fitted against the shoulder a U-shaped clamp pivoted on the outer end of the spindle, said head having a second passage formed therethrough at right angles to the first and run through the large-sized portion thereof, said rod being passed through the last-named passage, as and for the purpose described.

2. The herein-described combination of a rod, brackets to which said rod is attached, a head adapted to slide upon said rod, a screw for holding said head in any adjustment upon the rod, a spindle swiveled within the head, a clamp pivoted to the outer end of the spindle, and a screw threaded through one end of the clamp for securing the device to a tub, as specified.

608,258. PLANET-GEAR MOTION-TRANSMITTING AND SPEED-VARYING MECHANISM. HAROLD P. BROWN, New York, N. Y. Filed Mar. 11, 1893. Serial No. 465,629. (No model.)



Claim.—1. In a planet-gear mechanism, the combination with shaft B of disk D, secured to said shaft, planet-gears *d d* carried by said disk, sleeve E loose upon said shaft and having pinion *d'* secured thereto and meshing with said planet-gears, internal gear C having friction-brake surface C' and a brake applicable thereto, a frame or support to which said brake is secured, supplemental friction-wheel F, and a supplemental friction device H mounted to revolve with said internal gear C, said internal gear C having a hollow shell C^3 C^3 furnished with bearing sleeves or hubs C^4 C^5, and means for operating said brake G and said supplemental friction device H, substantially as specified.

2. In a planet-gear mechanism, the combination with shaft B of disk D secured to said shaft, planet-gears *d d* carried by said disk, sleeve E loose upon said shaft and having pinion *d'* secured thereto and meshing with said planet-gears, internal gear C having friction-brake surface C' and brake C applicable thereto, a frame or support to which said brake is secured, supplemental friction-wheel F, and supplemental brake device H mounted to revolve with said internal gear C, said internal gear C having a hollow shell C^3 C^3 furnished with bearing sleeves or hubs C^4 C^5, said disk having a sleeve or hub D', said sleeves or hubs C^4 C^5 fitting one upon said hub D', and one upon said sleeve E, and means for operating said brake G and supplemental friction device H, substantially as specified.

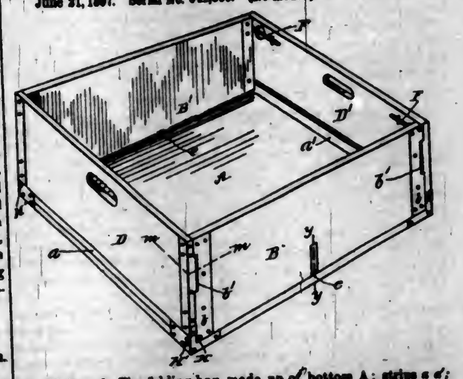
3. In a planet-gear mechanism, the combination with shaft B of disk D secured to said shaft, planet-gears *d d* carried by said disk, sleeve E loose upon said shaft and having pinion *d'* secured thereto and meshing with said planet-gears, internal gear C having friction-brake surface C' and a brake applicable thereto, a frame or support to which said brake is secured, supplemental friction-wheel F, and supplemental brake device H mounted to revolve with said internal gear C, said internal gear C having a hollow shell C^3 C^3 furnished with bearing sleeves or hubs C^4 C^5, said disk D having a sleeve or hub D', said sleeves or hubs C^4 C^5 fitting one upon said hub D', and one upon said sleeve E, bushings *c c* at the bearings between said revolving parts, and means for operating said brake G and supplemental friction device H, substantially as specified.

608,254. LEG FOR BATH-TUBS. DAVID D. BUICK, Detroit, Mich. Filed Aug. 11, 1897. Serial No. 647,807. (No model.)

Claim.—1. The combination with a base having a shouldered seat formed thereon, and a strap or horizontal flange beside said seat, of a leg adapted to be engaged with said seat so as to be held thereby from lateral movement in any direction, a laterally-extending tongue on said leg adapted to be engaged above said strap by inclining the leg before engaging it with its seat and a set-screw in said strap adapted to clamp said tongue to hold the leg to its seat.

2. The combination with a base, having a shouldered seat formed thereon, of a leg adapted to engage with said seat and provided with a laterally-extending lug or tongue, a strap or flange on said base projecting beneath said lug or tongue, and a set-screw on said strap or flange adapted to clamp said lug or tongue against the base to secure the leg from displacement.

3. The combination with a base, having the lugs G and H formed thereon, of a leg having the shoulders E and F adapted to bear against the lugs G and H, and the lug or tongue D projecting from one side thereof; the strap or flange I on the base projecting beneath the lug or tongue D and the set-screw passing through said strap or flange, adapted to clamp said lug or tongue to the base.



608,255. FIXTURE FOR CURTAIN-ROLLERS. AUGUST CAESAR, Butte, Mont. Filed Mar. 25, 1897. Serial No. 629,124. (No model.)

Claim.—1. A bracket for the purpose set forth made up of a single piece of wire which is looped upon itself to present parallel members forming a slot, the end portions of the wire being twisted upon themselves and one end extended to form a supporting-arm terminating in an eye, while the other is extended at an angle to form a pivot-pin, substantially as shown and for the purpose set forth.

2. In combination with a shade-roller having a drum and ratchet-wheel, of a bracket made of a single piece of wire which is looped upon itself centrally to present parallel members forming a slot, the end portions of the wire being twisted upon themselves at the end of the loop and one end portion extended to form a supporting-arm terminating in an eye while the other end portion extends at substantially right angles to provide a pivot-pin; together with a pawl made of a single piece of wire formed centrally into a number of coils to receive the pivot-pin of the bracket, while the end portions form the pawl proper and operating-arm therefor, the terminal of the latter being bent into a loop, substantially as shown and for the purpose set forth.

608,256. BOX. GEORGE W. CARVER, Brookline, Mass. Filed June 21, 1897. Serial No. 641,603. (No model.)

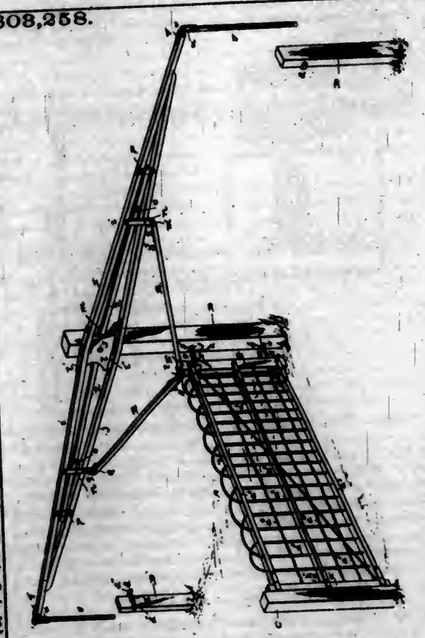
Claim.—1. The folding box made up of bottom A; strips *a a'*; ends D D' hinged to strips *a a'* and provided with strips of sheet metal secured to their ends and hooks *d'* formed integral with those strips; sides B B' hinged to bottom A and provided with strips of sheet material secured to their ends in which are cut slots *b'* all arranged so that the swinging of the ends and sides into an upright position will cause hooks *d'* to engage slots *b'* substantially as and for the purpose described.

2. The folding box made up of bottom A provided with staples *c'*; strips *a a'* provided with staples *c'*; ends D D' hinged to strips *a a'* provided with strips of sheet metal secured to their ends, hooks *d'* formed integral with those strips and hooks *c* secured to their lower edges; sides B B' hinged to bottom A provided with strips of sheet material secured to their ends in which strips are cut slots *b'* and with hooks *c* secured to their lower edges, all arranged so that when the sides and ends are swung into an upright position the hooks *d'* will engage slots *b'* and hooks *c* will engage staples *c'* substantially as and for the purposes described.

608,257. WHIFFLETREE-COUPLING. FRANK W. CHENEBRING, Cabot, Vt. Filed Dec. 3, 1897. Serial No. 660,566. (No model.)

Claim.—1. In a whiffletree-coupling, the whiffletree; the hard-metal lining D rigid in the bore therein and provided with the plate K extending under and secured to the under side of the whiffletree, said plate being formed with the downwardly-projecting annular flange or cup K'; the cross-bar; the hard-metal lining C rigid in the bore therein and provided with the flange or plate F extending over and secured to the upper surface of the cross-bar, said plate being provided with the integral metallic platform or circular block F' formed with the annular groove F'' for the reception of the balls H, said cup or flange extending down over the platform or block as described; the bolt E extending down through the said linings D and C; and a safety-spring one end of which is secured to the bolt between the head thereof and the upper surface of the whiffletree, and the other end is secured to the bolt below the cross-bar and held in such position by a suitable nut, substantially as described.

2. In a whiffletree-coupling, the whiffletree provided with the metal lining D secured thereto and formed with the plate K extending under the whiffletree, said plate being provided with the downwardly-extending flange or cup K'; the cross-bar provided with the metal lining C formed with the plate F extending over the surface of the cross-bar, said plate being provided with the circular platform or block F' extending up into the said cup; the bolt E extending through said linings in the whiffletree and cross-bar; the spring L provided at its lower end with the oppositely-extending spring-arms S, the upper end of said spring being secured to the bolt between the head thereof and the upper side of the whiffletree and the lower end being secured to said bolt below the cross-bar, said spring-arms being formed to hold the portion of the spring next the lower end of the bolt normally at a short distance below the cross-bar; and a nut adapted to regulate the tension of the spring at that point thereby holding the two parts of the coupling together and keeping the bolt rigid with the cross-bar, thus allowing the whiffletree to turn thereon, substantially as set forth.



608,258. GATE. WILLIAM H. CLAY, Elizabeth, Ky. Filed June 17, 1895. Renewed Oct. 23, 1897. Serial No. 656,706. (No model.)

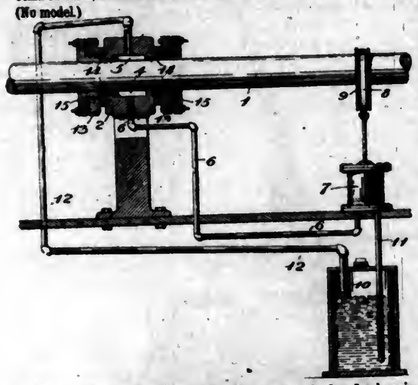
Claim.—1. The combination with a hinge-post, a gate, and a lower hinge, of an upper hinge having two pintle-hooks, connected by a perforated link, which is provided with a boss or seat between its perforations, substantially as and for the purposes described.

2. The combination with a hinge-post, a gate, and a lower hinge, of the upper hinge consisting of a bolt attached to the gate, another bolt attached to the hinge-post and provided with an eccentric face and with a vertical pintle situated in a vertical plane to one side of the plane of the pintle of the lower hinge, and a link having an eccentric boss or seat arranged to ride against the eccentric face of the hinge-bolt, as and for the purposes described.

3. A walking-beam for gates comprising the socketed central plate, the converging bars *i j* attached at their inner ends to the central plate and fastened together at their outer ends, the brace-plates *n, o*, attached to said bars at points between their ends, the back plate *m* arrranged opposite to the central plate, and the brace-bars *k* inclined laterally to the bars *i, j*, and fastened to the plate *m*, the brace-plate *n, o*, and to the bars *i, j* substantially as described.

608,258.

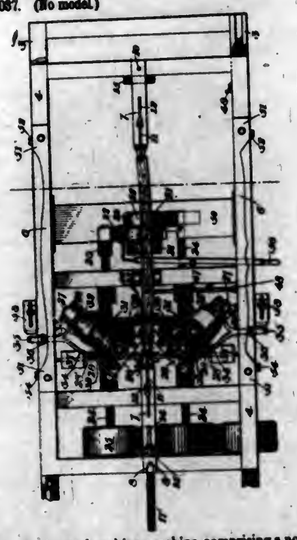
608,259. WHEEL. JAMES R. COMPTON, Lynn, Mass. Filed May 24, 1898. Serial No. 682,408. (No model.)



Claim.—1. In combination, the hub, a series of rocking levers supported by the hub, a series of arms engaged by one end with the levers, a rim engaged by the opposite ends thereof, and means connecting with the free ends of the levers, to be moved for rocking the levers whereby the arms are drawn together, substantially as described.

2. In combination, a hub, a series of rocking levers supported by the hub, a series of arms engaged by one end with the levers, a rim engaged to the opposite ends thereof, and means supported adjustably on the hub, in connection with the free ends of the levers, to be moved thereagainst for rocking the levers, whereby the arms are drawn for tightening the parts together, substantially as described.

3. In combination, a hub comprising the disk provided with flanges, a series of rocking levers fulcrumed on the disk against said flanges, a series of arms engaged by one end with the levers, a rim engaged by the opposite ends thereof, and means connecting with the free ends of the levers, to be moved thereagainst for rocking the levers, whereby the arms are drawn for tightening the parts together, substantially as described.



4. In combination, a hub, a series of rocking levers supported by the hub, a series of arms engaged by one end to the levers, a rim composed of voussoirs engaged by the opposite ends of said arms, and means connecting with the free ends of the levers to be moved for rocking the levers, whereby the arms are drawn for binding the voussoirs together, substantially as described.

608,260. MEANS FOR LUBRICATING SHAFT-BEARINGS. ORIN F. COOK, San José, Cal. Filed Oct. 12, 1897. Serial No. 654,967. (No model.)

Claim.—The combination with a horizontal shaft, of a bearing-box provided at its ends with stuffing-boxes and having formed respectively in the upper and lower sides of its bore, and in the same vertical plane, oil chambers or pockets disposed longitudinally of the shaft and of a materially less width than the diameter of the latter, whereby the shaft will form a loose closure for the open sides of said chambers or pockets, an oil-inlet pipe arranged to deliver oil under pressure to the lower of said chambers or pockets, and an oil-outlet pipe communicating with the upper of said chambers or pockets and of a greater diameter than said inlet-pipe, substantially as set forth.

608,261. WOODWORKING-MACHINE. DAVID P. COOPER, Struthers, Ohio. Filed Oct. 30, 1895. Renewed Oct. 4, 1897. Serial No. 654,037. (No model.)

Claim.—1. A woodworking-machine, comprising a non-rotatable frame carrying a blank and having a pattern thereon, a rotatory mandrel having a circular cutter, the axial line of the mandrel and cutter lying substantially in a plane passing through the center of the blank, a roller movable upon the pattern and connected to the cutter, and means for moving the cutter and the frame relatively to each other.

2. A woodworking-machine, comprising a non-rotatable frame, carrying a blank and having thereon oppositely-arranged patterns, rotary mandrels on opposite sides of the frame and having thereon circular cutters, the axial lines of the cutters lying substantially in a common plane which passes through the center of the blank, rollers movable upon the patterns and connected to the cutters, and means for moving the frame and cutters relatively to each other.

3. A woodworking-machine, comprising a non-rotatable frame carrying a blank and having oppositely-arranged patterns thereon, swinging standards having circular cutters thereon, said cutters being located oppositely to each other and having their axial lines lying substantially in a common plane which passes through the center of the blank, each cutting its edge of the blank independently of the other cutter, rollers movable upon the patterns and connected to the cutters, and means for moving the frame longitudinally past the cutters.

4. A woodworking-machine, comprising a non-rotatable frame arranged to carry a blank and having oppositely-arranged patterns thereon, a swinging standard having a rotatory mandrel carrying a circular cutter, the axial line of the cutter lying in a plane which passes through the center of the blank, a driven pulley having the same axis as the pivot of the swinging standard, a belt extending from the pulley to the shaft of the rotatory mandrel, and means for moving the frame longitudinally past the cutters.

5. A woodworking-machine, comprising a frame arranged to carry a blank and having oppositely-arranged patterns thereon, rotary cutters carried on shafts mounted in swinging standards, two driven shafts belted to the cutter-shafts, yokes connected to the standards and having rollers bearing upon the patterns, and a shaft arranged to move the frame past the cutters, said shaft having belt connections arranged to drive the same from either of the driven shafts; substantially as described.

6. A woodworking-machine comprising a frame having a pattern thereon, a blank-carrying bar removably secured thereto, said bar having clamps for holding the blank in place, a rotary cutter arranged to operate upon the blank, a roller movable upon the pattern and connected to the cutter, and means for moving the cutter and frame relatively to each other; substantially as described.

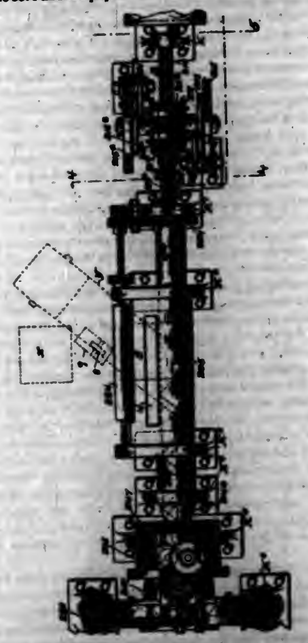
7. A woodworking-machine, comprising a frame having a pattern thereon, a blank-carrying bar removably secured thereto, said bar having clamps for holding the blank in place, a yielding roller arranged to press upon the upper face of the blank, a rotary cutter arranged to operate upon the blank, a roller movable upon the pattern and connected to the cutter, and means for moving the cutter and frame relatively to each other; substantially as described.

8. A woodworking-machine comprising a frame arranged to carry the blank and having a pattern thereon, a rotary cutter mounted upon a swinging standard and arranged to operate upon the blank, the cutter being so arranged that its axial line lies in a plane which passes through the center of the blank an adjustable bearing for said standard, and a roller bearing upon the pattern and having a support connected to the swinging standard, substantially as described.

603,262. WRAPPING-MACHINE. LUTHER C. CROWELL, Brooklyn, N. Y., assignor to Robert Hoe, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Aug. 4, 1897. Serial No. 647,060. (No model.)

Claim.—1. The combination of a core, a reciprocating member for advancing a paper longitudinally on the core, and means for winding a wrapper about the core and the paper on the core to form a spirally-wound wrapper-tube inclosing the core and the paper thereon, substantially as described.

2. The combination of a rotating core, a reciprocating member rotating with the core for advancing a paper longitudinally on the core, and means for guiding a wrapper to the core at an angle to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.



3. The combination of a rotating core, means for feeding papers successively to the core transversely to the axis of the core, a reciprocating member rotating with the core for advancing the papers longitudinally on the core, and means for guiding a succession of wrappers to the core at an angle to spirally wind the wrappers about the core and the papers thereon, substantially as described.

4. The combination of a core, a pusher moving longitudinally of the core to advance a paper on the core, and means for winding a wrapper about the core and the paper to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.

5. The combination of a rotating core, a pusher rotating with the core and moving longitudinally thereof to advance a paper on the core, and means for guiding a wrapper to the core to form a spirally-arms of the crank-axle with the cranks of the drive-wheel axle, an wound wrapper-tube about the core and the paper thereon, substantially as described.

6. The combination of a rotating core, means for feeding papers successively to the core, a pusher rotating with the core and moving longitudinally thereof to advance the papers on the core, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

7. The combination of a rotating core, means for feeding papers successively to the core transversely to the axis of the core, a reciprocating pusher rotating with the core and engaging the successive papers to advance them longitudinally on the core, means for guiding a succession of wrappers to the core to spirally wind the wrappers about the core and the papers thereon, substantially as described.

8. The combination of a rotating core, means for feeding papers successively to the core transversely to the axis of the core, a reciprocating pusher rotating with the core and engaging successive papers to advance them longitudinally on the core, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, feeding devices engaging the wrapper-tube beyond the wrapping-point, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

9. The combination of a rotating core, a reciprocating pusher carried by the core and spring-pressed to project outside the core, means for reciprocating said pusher to advance successive papers longitudinally on the core, and means for guiding a succession of wrappers to the core at an angle to spirally wind the wrappers about the core and the papers thereon, substantially as described.

10. The combination of means for supporting a succession of independent papers as they are longitudinally advanced, means for feeding the papers successively to said supporting means, a pusher engaging successive papers to advance them longitudinally, and means for winding a succession of wrappers spirally about the papers as they are advanced, substantially as described.

11. The combination of a rotating core, pushers 230, 230ª mounted within the core and spring-pressed to project outside the core, means for reciprocating said pushers alternately longitudinally of the core to advance alternate papers longitudinally on the core, means for guiding a succession of wrappers to the core at an angle to spirally wind the wrappers about the core and the papers thereon, substantially as described.

12. The combination of a rotating core, means for feeding papers successively to the core transversely to the axis of the core, pushers 230, 230ª mounted within the core and spring-pressed to extend outside the core, means for reciprocating said pushers alternately longitudinally of the core to advance alternate papers longitudinally on the core, means for guiding a succession of wrappers to the core at an angle to spirally wind the wrappers about the core and the papers thereon, substantially as described.

13. The combination of a rotating core, spring-pressed pushers 230, 230ª mounted to reciprocate within the core and extending outside the core, operating-rods 213, 213ª for reciprocating said pushers extending beyond the core, and means for reciprocating said rods alternately, substantially as described.

14. The combination of a rotating core, a casing extending about the core, means for advancing papers successively to the core through an opening in the casing, a reciprocating pusher rotating with the core and engaging the successive papers to advance them longitudinally on the core inside the casing, and means for guiding a succession of wrappers to the core at an angle through an opening in the casing to spirally wind the wrappers about the core and the papers thereon, substantially as described.

15. The combination of a rotating core, a casing extending about the core, means for advancing papers successively to the core through an opening in the casing, a reciprocating pusher rotating with the core and engaging the successive papers to advance them longitudinally on the core inside the casing, means for guiding a continuous wrapper-web to the core at an angle through an opening in the casing to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, feeding devices engaging the wrapper-tube beyond the wrapping-point, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

16. The combination of a core, means for advancing a paper longitudinally on the core, means for winding a wrapper about the core and the paper to form a spirally-wound wrapper-tube inclosing the core and the paper thereon, and means for flattening the wrapper-tube and inclosed paper as they are advanced from the core, substantially as described.

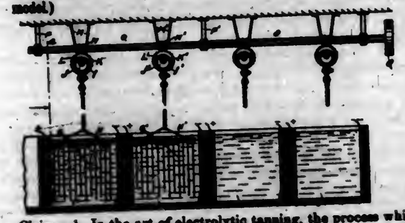
17. The combination of a rotating core, means for advancing a paper longitudinally on the core, means for guiding a wrapper to the core at an angle to form a spirally-wound wrapper-tube about the core and the paper thereon, and guides rotating with the core for flattening the wrapper-tube and inclosed paper as they are advanced from the core, substantially as described.

18. The combination of a core, means for advancing a succession of independent papers longitudinally on the core in line, means for winding a continuous wrapper-web spirally about the core and the papers on the core to form a continuous spirally-wound wrapper-tube inclosing the core and the papers thereon, means for flattening the wrapper-tube and inclosed papers as they are advanced from the core, and means for severing the flattened wrapper-tube between successive papers, substantially as described.

19. The combination of a rotating core, means for advancing a succession of independent papers longitudinally on the core in line as it rotates, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, means for flattening the wrapper-tube and inclosed papers as they are advanced from the core, and means for severing the flattened wrapper-tube between successive papers, substantially as described.

20. The combination of a rotating core, means for advancing a succession of independent papers longitudinally on the core in line as it rotates, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, guides rotating with the core for flattening the wrapper-tube and inclosed papers as they are advanced from the core, and a cutting-blade rotating with said guides for severing the flattened wrapper-tube between successive papers, substantially as described.

21. The combination of a rotating core, means for advancing a succession of independent papers longitudinally on the core in line as it rotates, means for guiding a continuous wrapper-web to the core to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, guides rotating with the core for flattening the wrapper-tube and inclosed papers as they are advanced from the core, and feeding and cutting rolls rotating with said guides for advancing the flattened wrapper-tube and inclosed papers and severing the wrapper-tube between successive papers, substantially as described.



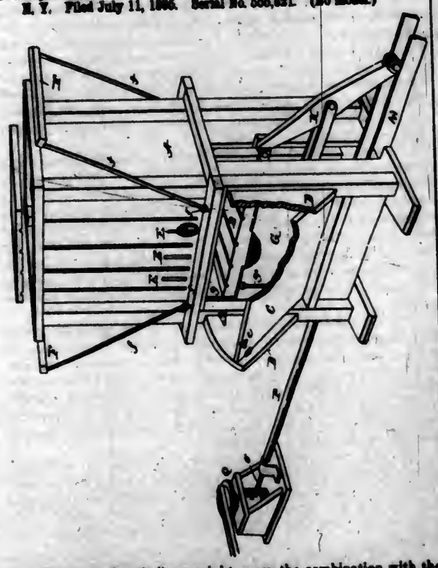
22. The combination of the rotating core 200, casing 205, means for advancing a succession of independent papers longitudinally on the core inside the casing, means for guiding a continuous wrapper-web to the core to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, feeding and cutting rolls 241 rotating with the core, and means for flattening the wrapper-tube and inclosed papers as they are advanced from the core to the cutting-rolls, substantially as described.

23. The combination of means for supporting and rotating a paper, means for applying a wrapper about the paper to form a wrapper-tube inclosing the paper, means for advancing the wrapped paper longitudinally, and means rotating with the paper-rotating means for flattening the wrapper-tube and inclosed paper, substantially as described.

24. The combination of a rotating core, means for applying a wrapper about the core and a paper thereon to form a wrapper-tube inclosing the paper and core, means for advancing the wrapped paper

longitudinally from the core, and means rotating with the core for flattening the wrapper-tube and inclosed paper, substantially as described.

603,263. PROCESS OF AND APPARATUS FOR ELECTROLYTIC TANNING. EDWARD DAVIS, Philadelphia, Pa., and HORACE R. MUSTARD, Smyrna, Del. Filed July 27, 1896. Serial No. 600,605. (No model.)



Claim.—1. In the art of electrolytic tanning, the process which consists in suspending skins and effecting their continuous vertical reciprocation in a solution of tanning liquor, simultaneously passing an electric current through said solution of tanning liquor perpendicular in direction to the surfaces of said skins, and intercepting the particles precipitated at the anodes or passing therefrom by the action of a screen, as specified.

2. In the art of electrolytic tanning, a journaled shaft, a worm fixed on said shaft and adapted to revolve therewith, a second journaled shaft and a gear-wheel fixed thereon adapted to engage said worm, an eccentric fixed on said second shaft, a tanning-vat, in combination with electrodes, a frame for suspending skins therefrom within the vat, and means for connecting said frame and eccentric, as specified.

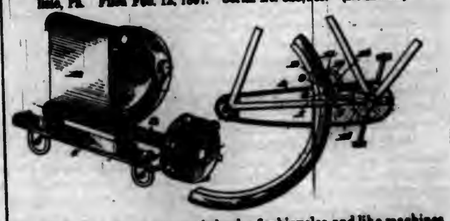
3. In the art of electrolytic tanning, the process which consists in, first, purifying water by electrolysis, then leaching with said water, then electrolyzing the tanning liquor obtained from leaching, then suspending the skins to be tanned in said tanning liquor and subjecting them to the action of an electric current, as specified.

4. The combination of a tanning-vat, electrodes so arranged as to pass an electric current across the vat from electrode to electrode when the vat is supplied with tanning liquor and means for vertically suspending and vertically reciprocating the skins between the electrodes with the sides of the skins opposed to the direction of the electric current, as and for the purpose set forth.

603,264. BALING-PRESS. PETER K. DEDERICK, Londonville, N. Y. Filed July 11, 1896. Serial No. 598,631. (No model.)

Claim.—1. In a baling upright press, the combination with the press-case, having the open upper end, a feed-opening in the side wall, at or near the bottom of the same, the removable head with means of retaining the same in the open upper end of the press-case of the reciprocatory traverser working in the press-case, and the guard-door connected directly therewith, and having a movement relative thereto and bridging or closing the feed-opening when the traverser is elevated, substantially as described.

2. In a baling-press, the combination with the press-case, having the open upper end, a feed-opening in the side wall at or near the bottom of the same, and the removable head with means for retaining the same in the open upper end of the press-case, of the reciprocatory traverser working in the press-case, and the door-section loosely connected therewith, and bridging or closing the feed-opening when the traverser is elevated, whereby the traverser is permitted to drop to the bottom of the press-case, substantially as described.



3. In a baling-press, the combination with the press-case having the open upper end, a feed-opening in the side wall, at or near the bottom of the same, and a removable head with means for retaining the same in the open upper end of the press-case, of a reciprocatory traverser working in the press-case, the door formed by the substantially flat piece of sheet metal working in guides in the press-case, and loosely connected with the traverser, whereby it is adapted to close the feed-opening when the traverser is elevated, and to permit of a movement of the traverser when the door is arrested; substantially as described.

4. In a baling-press, the combination with the vertical press-case having the feed-opening in the side wall, at or near the bottom, the feed-door for closing said opening, hinged at the lower edge to constitute a hopper when open, of the traverser reciprocating within the case, and a guard-door section loosely connected with the traverser for closing the feed-opening when the traverser is elevated, whereby the hopper may be filled without regard to the position of the traverser; substantially as described.

5. In a press, the press-frame and traverser adapted to work therein, of a straight power-arm pivotally connected to the traverser at one end and supported by the press-frame at the extreme opposite end, a toggle-lever pivotally connected with the traverser at one end and pivotally connected with the press-case at the opposite end, a link or links connecting the straight lever and toggle-lever for simultaneous movement in the same direction and the power applied in line with the lower end of the straight arm; substantially as described.

6. In a baling-press, the combination with the press-frame having the track in the lower portion thereof and the reciprocatory traverser working in the press-frame, of the toggle-lever pivotally connected to one end of the traverser and frame, the straight power-arm pivotally connected to the opposite end of the traverser and resting on the track at the opposite end and a link or links connecting said straight arm and toggle-lever for simultaneous movement in the same direction; substantially as described.

603,265. BACK-PEDALING BRAKE. CHARLES F. DUBLE, Carlisle, Pa. Filed Feb. 12, 1897. Serial No. 622,146. (No model.)

Claim.—1. In an automatic brake for bicycles and like machines, the combination with the drive-wheel, crank-axle, and connections between the drive-wheel and crank-axle embodying a clutch mechanism, whereby the machine may be impelled upon forward pedaling and the crank-axle may have its motion reversed or be held stationary without effecting the forward motion of the machine, of a shaft journaled in bearings parallel with the crank-axle, a brake secured upon an end portion of the shaft and normally held out of action when pedaling forward, gear elements applied to the said shaft and crank-axle, one of the said elements containing a clutch mechanism to permit of forward pedaling without setting the brake and to apply the brake upon back-pedaling, and means for connecting the said gear elements, substantially as described.

2. In an automatic brake for bicycles, &c., the combination of a shaft bearing a brake, sprocket-wheels applied to the crank and brake shafts, respectively, a sprocket-chain connecting the sprocket-wheels, an intermediate clutch mechanism for throwing the brake-shaft into active position upon the application of back pressure to the pedals and connections between the crank-axle and drive-wheel embodying a clutch mechanism, substantially as described.

3. In a brake mechanism for bicycles and the like, the combination with a ground-wheel, of a shaft, side pieces, means for adjustably connecting the shaft with reference to the side pieces, an end and a middle support, an endless band supported by the shaft and the end and middle supports, and means for turning the shaft in its bearing to set the brake, substantially as set forth.

4. In an automatic brake for bicycles, &c., the combination of a shaft, a brake secured to the shaft and disposed to automatically fall away from the drive-wheel, a gear-wheel mounted upon the said shaft and having clutched engagement therewith to cause the setting of the brake upon back-pedaling, a direct connection between the gear-wheel of the brake-shaft and the crank-shaft, and means for transmitting motion from the aforesaid shaft to the drive-wheel and embodying a clutch mechanism, substantially as and for the purpose set forth.

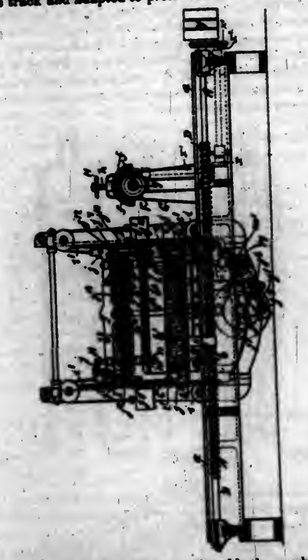
5. An automatic brake for bicycles, &c., comprising a plate having stub-arms, a shaft mounted in the said arms, curved side pieces secured to the shaft, an end and an intermediate support having connection with the side pieces, an endless band passing around the shaft and the said supports, a sprocket-wheel mounted upon the shaft and having a clutch engagement therewith to turn backward with the shaft and permit the shaft to turn forward independently thereof, means for imparting movement to the sprocket-wheel directly from the pedal-shaft and means for transmitting motion from the aforesaid shaft to the drive-wheel and embodying a clutch mechanism; substantially in the manner and for the purpose specified.

603,266. SAND-BOX. JAMES B. DOBLEY, Hartford, Conn., assignor of one-half to Halsey B. Philbrick, same place. Filed Dec. 4, 1897. Serial No. 660,796. (No model.)

Claim.—1. The combination, with a sand-box, of a discharge-pipe passing through said sand-box and having its inlet located above the level of the sand, and an air-blast pipe leading into said sand box and having an air-blast opening or openings situated below the inlet end of said discharge-pipe and above the level of the sand.

2. The combination, with a sand-box, of a discharge-pipe passing through and into said sand-box and flared at its upper end, and an air-blast pipe passing through the sand-box and one end surrounding the discharge-pipe, said surrounding portion having one or more air-escape openings.

3. The combination, with a sand-box, of a discharge-pipe passing through the bottom of the sand-box and having a flared inlet end located above the level of the sand, and an air-blast pipe passing through the sand-box and having an annular portion surrounding the discharge-pipe, said annular portion having one or more air-escape openings on its under side.



4. The combination, with a sand-box, of an air-blast pipe, and a sand-discharge pipe the delivery and receiving ends, respectively, of which are situated in the sand-box and are located above the level of the sand.

5. The combination, with a sand-box, of a discharge-pipe communicating therewith and having a flared inlet, a removable cap for covering the inlet of said pipe, a detachable cover for the sand-box, and an air-blast pipe leading into the latter.

6. The combination, with a sand-box, of a discharge-pipe communicating therewith and having a flared inlet above the level of the sand, and an air-blast pipe passing through a wall of the sand-box and having an air-escape opening or openings.

603,267. MACHINE FOR SAND-MOLDING. JOSEPH D. DUNKEY, Glasgow, Scotland, and WILLIAM RADDON, Rotherham, England. Filed Sept. 28, 1896. Serial No. 607,060. (No model.) Patented in England Dec. 12, 1896, No. 29,782.

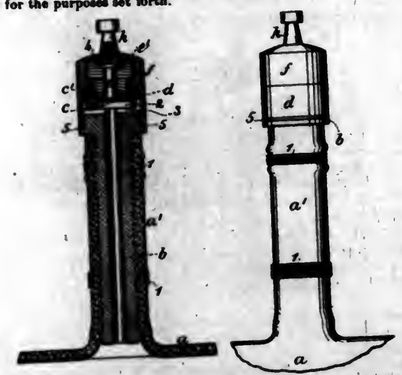
Claim.—1. In a machine for making sand molds, the combination of a platform B carrying mold-boxes b', b^3, box b' being positioned on the platform, the other box being above box b' with means for moving it toward and from the same, means for raising both boxes from the platform, inverting and then lowering them, a machine-bed having rails on which said platform can travel under and out from under said means, a screw D in said bed, a nut engaging the screw and operatively connected to the platform, and a compression-roller above the track and adapted to press sand into the mold-boxes.

2. In a machine for making sand molds the combination of lifting-frames J actuated by crank-disks j' and connecting-rods, suspension-arms j^3 pivoted on said frames, and engaging trunnion-axles O formed on the parts of the mold-box to raise it, a worm-wheel e on one of said trunnions, and a transverse spindle k and worm K thereon and engaging worm-wheel e, to effect the turning of said box when it is desired to fill the other box part or parts with sand, substantially as described.

3. In a machine for making sand molds, the combination with the lifting-frames J of devices for separating the mold box parts and removing the pattern-plate b^4, said devices consisting of vertical shafts N in bearings on the lifting-frames J carrying levers n to which are pivoted horizontal shelves n' adapted to engage with the pattern-plate b^4 and upper box part or parts, substantially as described.

4. In a machine for making sand molds, the combination of a platform B carrying mold-boxes b', b^3, box b' being positioned on the platform, the other box being above box b', means for moving it toward and from box b', means for raising both boxes from the platform and turning them, a machine-bed having rails on which said platform can travel under and out from under said means, means for moving said platform and parts carried thereby on said track, a pneumatic roller above said track arranged to press the contents into said boxes when the platform and boxes are moved under it.

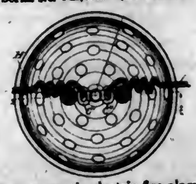
603,268. ELASTIC TIRE FOR VEHICLES. JAMES B. FORSYTH, Boston, Mass. Filed Sept. 7, 1897. Serial No. 650,705. (No model.)



Claim.—1. A tire composed of a tread portion and a base portion, each of vulcanizable compound formed with tube-receiving grooves; and a contractile resilient tube (one or more) which the grooves in the tread and base portions fit, the tread portion, base portion and tube being united by vulcanization, substantially as described.

2. In a tire composed of tread and base portions with a contractile resilient tube (one or more) vulcanized in place between them, a spiral wire to strengthen the interior tube, substantially as described.

603,269. VALVE FOR PNEUMATIC TIRES. EMIL FRITSCHLE, New York, N. Y., assignor to himself and Joseph Schottmuller, same place. Filed Oct. 10, 1896. Renewed Sept. 8, 1897. Serial No. 650,981. (No model.)

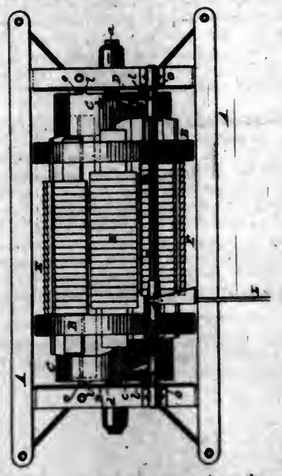


Claim.—1. In a valve for pneumatic tires, the combination with a tubular stem recessed at its outer end, of a perforated cover adapted to screw upon the end of the tubular stem, a disk within the recessed end of the tubular stem adapted to be seated against the end of said cover, a cap screwing upon the cover and perforated, and a device extending through and seated within the cap and acted upon by the disk to simultaneously shut off the escape of air at the opening in the cap with the closing of the opening in the cover, substantially as and for the purposes set forth.

2. In a valve for pneumatic tires, the combination with the tubular stem *b* recessed at 2 at its outer end and transversely slotted at 3, and a disk *c* received within the recessed end, of a cover *d* centrally perforated, and screwing upon the end of the tubular stem, a centrally-perforated cap *f* screwing upon the end of the cover *d*, the stem *c*, disk *c'* and washer 4, and the tapering head *h* passing through the opening in the cap and screwing upon the end of the stem *c*, said stem resting upon the disk *c* when the disk is seated upon the flat under side of the cover *d*, and the washer 4 being simultaneously pressed against the end of the cap *f* to form a double seal to prevent the escape of the confined air of the tire, and at the same time a means for providing, by the pressure of the finger against the head, for the escape of the air at pleasure, substantially as set forth.

3. In a valve for pneumatic tires, the combination with the tubular stem having a transverse slot, of a perforated cover screwed thereon and having a screw-thread to connect with a pump, a disk valve between the end of the stem and the under side of the cover, a removable perforated cap screwed on the cover, a valve adapted to close against the under side of the cap and its stem extending through the cap and nearly to the disk valve, so that the two valves can be opened by hand, substantially as specified.

603,270. AUTOMATIC ELECTRIC FIRE-ALARM. WALTER R. FROST, Lewiston, Me., assignor to Orland S. Ham, same place. Filed June 30, 1897. Serial No. 642,908. (No model.)



Claim.—1. In an automatic electric fire-alarm in combination a shell or case having an air-chamber and a concave or sunken drum-head or diaphragm, a movable float circuit-closer arranged centrally within said case or shell and loosely supported on said diaphragm a stationary electrode metallically connected to said case or shell and circuit-wires connected respectively to said electrode and float circuit-closer substantially as and for the purpose set forth.

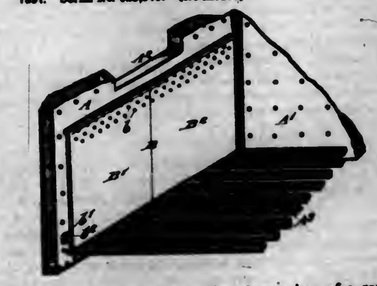
2. In an automatic electric fire-alarm, in combination an inclosing shell or case having an air-chamber and a concave or sunken diaphragm, a circuit-closing float supported loosely on said diaphragm, a guide-ring of fiber or suitable material secured within said case or shell, a stationary electrode and circuit-wires connected respectively to said float circuit-closer and stationary electrode substantially as and for the purpose set forth.

3. In an automatic electric fire-alarm in combination an inclosing shell or case having an air-chamber and a concave or sunken diaphragm, a movable circuit-closing float resting on said diaphragm, a guide-ring secured within said shell, a stationary electrode secured within said shell, a flexible hair wire connecting the said float, and one of the circuit-wires and an electrical connection from the other circuit-wire to the stationary electrode substantially as and for the purpose set forth.

608,271. COTTON-THINNER. RICHARD J. GATLING, New York, N. Y. Filed Dec. 18, 1897. Serial No. 662,445. (No model.)

Claim.—1. In a machine for thinning plants, the combination of the rotatable wheels B having a series of cutters mounted loosely therein, disks engaging the projecting ends of said cutters with cams for operating the same, and means for raising the disks and cutters, substantially as and for the purpose set forth.

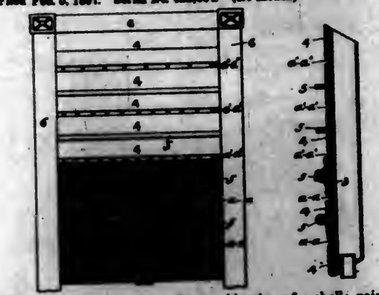
2. In combination with the movable disks, the cams F with means for adjusting the same, substantially as shown and described.



3. In a plant-thinning machine, the wheels B provided with slots adapted to permit a longitudinal and also a radial movement of cutters mounted therein, with means substantially such as shown and described for moving the cutters both longitudinally and radially in the slots of said wheels while in motion, as set forth.

4. In combination with the vertically-movable disks arranged to engage the ends of the cutters, the antifriction-rollers *r*, *r*, arranged to operate substantially as described.

5. In combination with the main frame and the vertically-movable disks, ribs or guides arranged to prevent lateral movement of the disks as set forth.



6. The combination in a plant-thinning machine, of the slotted wheels B, the cutters E mounted therein, the movable disks C provided with an annular recess to engage the ends of the cutters with cams located in said recesses, the rock-shaft *b* provided with a lever L, and arms *c* with rods *d* connecting said arms and disks, all constructed and arranged to operate substantially as herein described.

603,272. FURNACE. RAY GAUL, Brooklyn, N. Y. Filed Mar. 1, 1897. Serial No. 625,575. (No model.)

Claim.—The combination with a furnace-box, of a removable air-plate extending along one end of the same with its top in engagement with the end wall, the said air-plate being provided with hooks at its bottom adapted to engage studs or lugs projecting from the sides of the furnace-box for removably holding the bottom of the plate spaced from the end wall to form an air-space, the said plate being further provided with air-distributing openings near its top, substantially as set forth.

608,278. GAS-BURNER. JOSEPH F. HEWITT, Allegheny, Pa. Filed Feb. 6, 1897. Serial No. 622,604. (No model.)

Claim.—1. In gas-burners, the combination of a shell; pairs of transverse incombustible strips secured to the face of said shell; ribs of incombustible material secured between said strips and projecting at right angles to the face of the burner and gas-outlets between said pairs of transverse strips whereby the upper gas-jets are shielded from the blow-out effect of the lower gas-jets.

2. In gas-burners the combination of a shell; pairs of transverse strips of incombustible material secured to said shell; gas-outlets extending across said burner between adjacent pairs of said strips and incombustible material projecting horizontally intermediate of the pairs of the strips and shielding the gas-outlets.

608,274. FENCE. JOHN W. HOLLER, Van Buren, Ind., assignor of one-half to Charles D. Grandstaff, same place. Filed July 19, 1897. Serial No. 645,128. (No model.)

Claim.—1. A stay for wire-runner fences, provided with a plurality of runner-engaging eyes, projecting from one side surface of the stay, and arranged in a zigzag series alternately adjacent to opposite edges of the stay, each eye being closed and consisting of a loop having crossed sides, and diagonally-disposed connections between the eyes, arranged in contact with the opposite side of the stay, substantially as specified.

2. A stay for wire-runner fences provided in its opposite edges with a zigzag series of notches or seats, in combination with a zigzag tie-wire provided with spaced loops arranged respectively in said notches or seats, with the connecting portions between said loops arranged diagonally in contact with one side surface of the stay, all of said loops projecting perpendicularly beyond the opposite side surface of the stay to form runner-engaging eyes, substantially as specified.

3. A stay for wire-runner fences provided in its opposite edges with notches or seats arranged in a zigzag series, in combination with a continuous tie-wire provided with spaced loops arranged respectively in said notches or seats to project beyond a common side surface of the stay, and having the sides of the loops crossed, the connecting portions of the tire-wire lying in contact with the opposite side surface of the stay, substantially as specified.

4. In a fence, the combination with runners, of an intersecting stay provided in its opposite edges with notches or seats arranged in a zigzag series, and a continuous tie-wire terminally attached to the uppermost and lowermost runners, and provided at intervals with loops extending respectively through said notches or seats, and engaging the runners at the opposite side surface of the stay, substantially as specified.

5. In a fence, the combination of runners, the uppermost and lowermost runners being provided with crimps, a stay arranged at one side surface in contact with the runners, and having its extremities arranged contiguous to said crimps in the uppermost and lowermost runners, said stay being provided in its opposite edges with a zigzag series of notches or seats, and a continuous tie-wire terminally coiled around the crimped portions of said uppermost and lowermost runners, and provided with intermediate spaced loops arranged respectively in said notches or seats to form runner-engaging eyes, substantially as specified.

6. In a fence, the combination with runners, of an intersecting stay provided in its opposite edges with notches or seats arranged in a zigzag series and disposed respectively in the planes of the runners, and a tie-wire terminally attached to the uppermost and lowermost runners, extended transversely across the stay in the planes of said uppermost and lowermost runners, respectively, having its intermediate portion extended in a zigzag direction between said notches or seats, and provided at intervals with loops extending respectively through the notches or seats, and projecting beyond the opposite side surface of the stay, to form runner-engaging eyes, the intermediate eyes being loosely fitted upon the engaged runners, substantially as specified.

608,275. DUPLEX-WRITING APPARATUS. HOMER R. HOLMES, Burr Oak, Kans. Filed May 20, 1897. Serial No. 638,771. (No model.)

Claim.—1. A duplex-writing apparatus having a writing-plate provided at its front edge with a transverse guide, revoluble supports mounted upon the plate to traverse a stationary record-surface and support said plate in a position approximately parallel with, and with its front edge contiguous to the plane of, said surface, supply and receiving rollers mounted above and carried by the writing-plate, and one of them being operatively connected with said rolling supports for actuation thereby, and a record-strip terminally connected respectively to said supply and receiving rollers, traversing the upper and lower surfaces of the writing-plate, and extending around said transverse guide at the front edge thereof, substantially as specified.

2. A duplex-writing apparatus having a writing-plate, supporting-rollers mounted upon the writing-plate to traverse a record-surface, receiving and supply rollers mounted upon the writing-plate to carry a record-strip, the receiving-roller being carried by the common spindle of the supporting-rollers and adapted to receive rotary motion therefrom, and a handle projecting axially from one of the supporting rollers to provide for manually turning the same to advance the writing-plate and reel the record-strip, in combination with an inscribing medium having a plurality of inscribing-points to respectively traverse the record-strip and the record-surface, substantially as specified.

3. A duplex-writing apparatus having a writing-plate provided at its front end with a transverse guide, transversely opposite main supporting-rollers mounted upon the record-plate in rear of said transverse guide and adapted to traverse a record-surface, rear auxiliary rollers mounted upon the plate to traverse the record-surface in rear of the main supporting-roller, supply and receiving rollers mounted upon the writing-plate in rear of its transverse guide, the receiving-roller being carried by the spindle of said main supporting-rollers, and a record-strip terminally attached respectively to the supply and receiving rollers and extending around said guide, substantially as specified.

4. A duplex-writing apparatus having a writing-plate adapted to be advanced over a record-surface, a receiving-roller mounted upon the writing-plate for carrying a record-strip, a paper-clamp for engaging one extremity of the record-strip, and a flexible connection between the paper-clamp and the receiving-roller, substantially as specified.

5. A duplex-writing apparatus having a writing-plate adapted to be advanced over a record-surface and having a guide-slot parallel with its writing-surface, a receiving roller or drum mounted transversely above the plane of the writing-plate, a clamp comprising a bar having a slot for alinement with the slot of the writing-plate and a bail for engaging the inserted extremity of a record-strip, and a

flexible connection between said bar and the receiving-roller, substantially as specified.

6. A duplex-writing apparatus having a writing-plate provided with a slot parallel with its writing-surface, alined supporting-clips contiguous to the front edge of the writing-plate, a receiving-roller mounted transversely above the writing-plate, and a clamp flexibly connected with the receiving-roller for engaging the extremity of a record-strip, said clamp having a slotted bar adapted to be seated in said supporting-clips with its slot in registration with that of the writing-plate, and means for engaging the extremity of the strip inserted through the slot in the bar, substantially as specified.

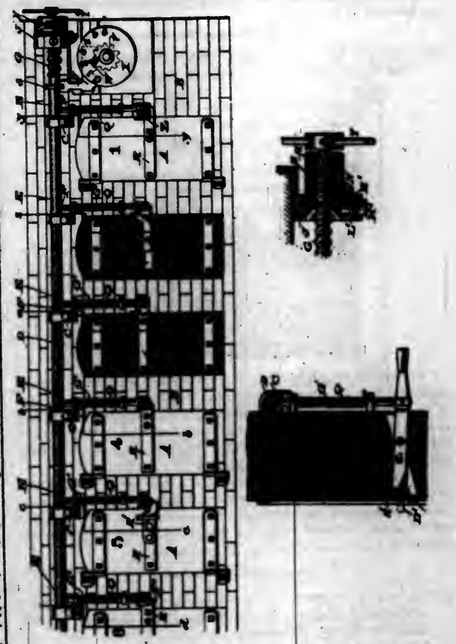
7. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of an inscribing medium having main and auxiliary inscribing-point holders, the auxiliary holder being mounted for lateral adjustment, and for adjustment toward and from the main holder, and means for securing the auxiliary holder in the desired position with relation to the main holder, substantially as specified.

8. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of an inscribing medium having main and auxiliary inscribing-point holders, the auxiliary holder being mounted for lateral adjustment, and for adjustment toward and from the main holder, and common means for securing the auxiliary holder at the desired adjustment against movement in either direction, substantially as specified.

9. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of main and auxiliary inscribing-point holders, the auxiliary holder being pivotally mounted upon the main holder for lateral adjustment with relation thereto, and being flexibly connected with said main holder for swinging movement in a plane perpendicular to said lateral movement, whereby the interval between the extremities of the holders may be varied, and means for securing the auxiliary holder at the desired adjustment, substantially as specified.

10. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of main and auxiliary inscribing-point holders, the auxiliary holder having a spring-shank pivotally mounted upon the main holder to allow lateral adjustment of the free end of the auxiliary holder, and adjustment of said free end toward and from the corresponding end of the main holder, and means for securing the auxiliary holder at the desired adjustment with relation to the main holder, substantially as specified.

11. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of main and auxiliary inscribing-point holders, the auxiliary holder being mounted upon the main holder for lateral and forward and rearward adjustment, a lateral ear on one of the holders provided with a plurality of threaded sockets, and an adjusting-screw swiveled upon the other holder and engaged with one of the sockets in said ear of the first-named holder, whereby the auxiliary holder may be secured at the desired adjustment in either of its planes of movement, substantially as specified.



12. In a duplex-writing apparatus, the combination with a writing-plate adapted to carry a record-strip and traverse a record-surface, of main and auxiliary inscribing-point holders each having a barrel, the auxiliary holder being mounted upon the main holder for lateral swinging movement and forward and rearward swinging movement, means connecting the holders for securing the auxiliary holder in the desired position in both of its planes of movement, and flat inscribing-points having carriers revolubly fitted in said barrels for adjustment to vary the relative positions of said inscribing-points, substantially as specified.

603,276. PNEUMATIC TIRE. WILLIAM L. JOLLY, Arrowtown, New Zealand. Filed Jan. 22, 1898. Serial No. 667,606. (No model.)

Claim.—In combination, the rim, the plurality of independent inflatable sections having necks extending through the rim, the continuous air-tube located inside the rim and having nozzles corresponding to said necks and designed to be detachably connected therewith, the single plate extending in line with all of the necks on one side, the plurality of independent plates located on the opposite side, and screws for securing the independent plates of the continuous plate and thereby clamping the necks, substantially as described.

603,277. LOCK FOR PRISON-CELLS. GERRAUS F. KENDZ, Woodbury, N. J., assignor of one-half to Charles R. Van Stege, same place. Filed Jan. 28, 1898. Serial No. 668,264. (No model.)

Claim.—1. A rod or shaft having thereon a series of recesses the members thereof extending in a coincident line, and another series of recesses thereon having its members extending in an irregular line and bolts for doors, adapted to enter all of the first-named recesses at one time, or either bolt to enter only one of the second-named recesses under a different adjustment of said shaft.

2. A rod or shaft having thereon series of recesses, one series thereof having its members extending in a coincident line, and the other series having its members extend in an irregular line, bolts adapted to engage said recesses, under a different adjustment of said shaft, and a register connected with said shaft, whereby the latter may be set to cause the registration of the recesses with the respective bolts.

3. In a lock for cells, a shaft in combination with means for imparting both rotary and sliding motions thereto, said shaft being provided with different series of recesses, the members of one series extending in a coincident line and those of the other series extending in an irregular line.

4. In a lock for prison-cells, a rotatable shaft having a recess thereon, a screw on said shaft, a shifting collar in which said screw is mounted, a sleeve on which said collar is mounted, and a lever on said collar which is adapted to engage said sleeve.

5. In a lock for prison-cells, a rotatable shaft having a recess thereon, a screw on said shaft, a shifting collar in which said screw is mounted and means for locking said collar.

6. In a lock for a prison-cell, a rotatable shaft with recesses therein, means for shifting said shaft in longitudinal direction, a series of bolts adapted to enter said recesses and bars or latches for said doors connected with said bolts, said recesses being in different series, the members of one series extending in a coincident line, and those of the other series extending in an irregular line.

7. In a lock for a prison-cell, a rotatable shaft with recesses therein, means for shifting said shaft in longitudinal direction, a series of bolts adapted to enter said recesses and bars or latches for said doors connected with said bolts, in combination with a register of the number of cells having the axis of its index connected with said shaft by means of a sliding bar which engages with said axis and is freely connected with said rotatable shaft.

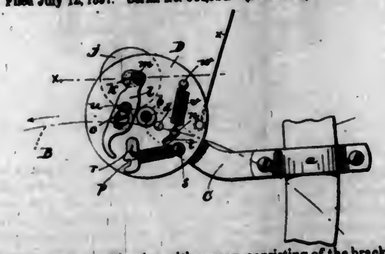
8. In a lock for a cell having outer and inner doors, a bolt, a shaft for controlling said bolt, and a latch operated by said bolt, in combination with locking-bars on said outer and inner doors engaged by said latch, the latter being provided with a shoulder which may

partially or entirely engage the bar of the inner door, said bolt thus serving to simultaneously lock both the outer and inner doors and unlock only the outer door or both doors.

9. In a lock for a prison-cell, a bolt, a recessed shaft for controlling said bolt, a shifting collar in which a threaded portion of said shaft is fitted, and a lock on the support of said collar, the latter having a keeper and said lock having a semicylindrical bolt which is adapted to enter said keeper.

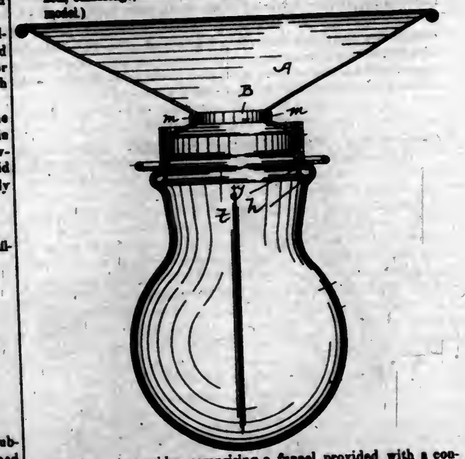
10. In a lock for a prison-cell, the latch Z, the bolt Q, and the bar R with which said bolt is adapted to engage, and the bar B' in combination with outer and inner doors for said cell, said latch having a lug such as C for engagement with the bar of the inner door, said latch being adapted to release the outer door without necessarily raising the inner door.

603,278. BEER-TAPPING IMPLEMENT. AUGUST KOPP, Hamilton, Ohio. Filed July 26, 1897. Serial No. 646,163. (No model.)



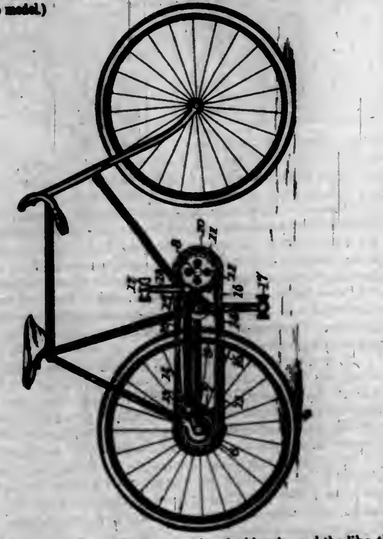
Claim.—1. In a beer-tapping implement, the combination, substantially as set forth, of a handle having an enlarged end formed with a dovetailed recess in its face, and a soft-metal block dovetailed in said recess and having its face forming the end extremity of said handle, said handle and block being provided with an open longitudinal groove.

2. In a beer-tapping implement, the combination, substantially as set forth, of a longitudinally-grooved handle provided with an enlarged end containing a socket at right angles to the axis of the handle and a socket at the end of the handle, a soft-metal block firmly seated in said last-mentioned socket and grooved in prolongation of the groove in the handle, and a wooden plug firmly seated in the first-mentioned socket.



3. In a beer-tapping implement, the combination, substantially as set forth, of a longitudinally-grooved handle having at one end a pair of transverse claws and having at the other end a socket at right angles to the axis of the handle and a socket at the end of the handle, a soft-metal block firmly seated in the last-mentioned socket and grooved in prolongation of the groove in the handle, and a wooden plug firmly seated in the first-mentioned socket.

603,279. BICYCLE-BELL. HAROLD G. MARTIN, Providence, R. I. Filed July 12, 1897. Serial No. 644,234. (No model.)

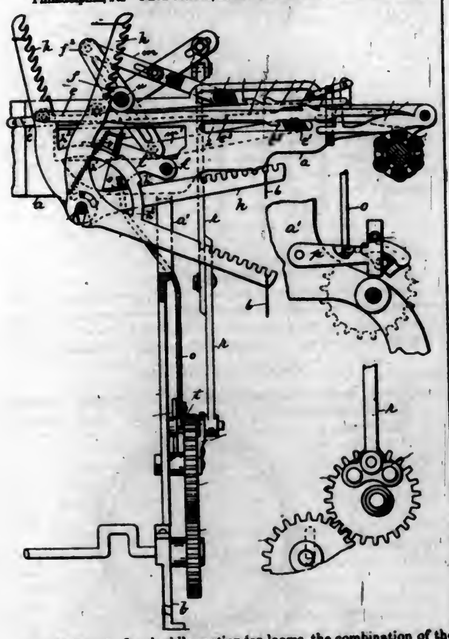


Claim.—In combination with a gong, consisting of the bracket C having a journal-stud *f* at its forward end, the oscillatory disk D eccentrically mounted upon said stud and having a centrally-projecting hub, integral with said disk, adapted to support the gong, the sleeve *g* projecting outwardly from the disk, and integral therewith, the shaft *i* loosely fitting in said sleeve and carrying the friction-roller, a crank *k* formed upon the inner end of said shaft, the claw-lever *l* attached to said crank and provided with an elongated slot *u*, the stud *o* fastened to the disk and loosely fitting in said slot, the spring-hammer *r* fastened to the disk and provided with a notch *p*, the slot *t* cut through the disk radially from the center of the journal-stud *f*, with a pin *n* fastened to the arm of the bracket and projecting through said slot, a pin *w* fastened to the disk, with the spiral spring *v* having its ends secured to each of said pins, respectively, adapted to turn the disk to throw and hold the friction-roller out of contact with the wheel, with means for turning the disk in the other direction to force the friction-roller into contact with the tire of the bicycle-wheel, substantially as shown and described.

603,280. CUSPIDOR FOR DENTAL CHAIRS. FRANK G. MCCLELLAN, Cambridge, Mass. Filed May 21, 1897. Serial No. 637,567. (No model.)

Claim.—A cuspidor comprising a funnel provided with a contracted neck, the lower end of said neck having an outward projection; a clamping-ring fitted to slide on said neck, and a rubber body adapted to be secured by its mouth between said neck and projection.

603,281. BICYCLE PROPELLING MECHANISM. THOMAS B. MCDERMOTT, Portland, Oreg. Filed May 25, 1897. Serial No. 638,123. (No model.)

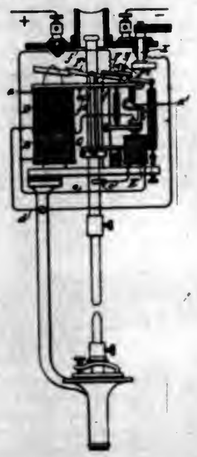


Claim.—1. In propelling mechanism for bicycles and the like, the combination of a drive-wheel, an axle mounted independently of and concentric with the drive-wheel, a crank-axle, means for connecting the crank-axle with the drive-wheel axle, an idle-shaft provided with differential gearing, and means for connecting the elementary parts of the differential gearing with the drive-wheel and its axle, substantially as set forth.

2. In propelling mechanism for bicycles and the like, the combination of a drive-wheel, an axle mounted independently of and concentric with the drive-wheel and provided at its ends with cranks, a crank-axle, pitmen connecting the cranks at the ends of the crank-axle with the cranks of the drive-wheel axle, an idle-shaft having differential gearing, and independent connections between the component parts of the said differential gearing and the drive-wheel and the drive-wheel axle, substantially as set forth.

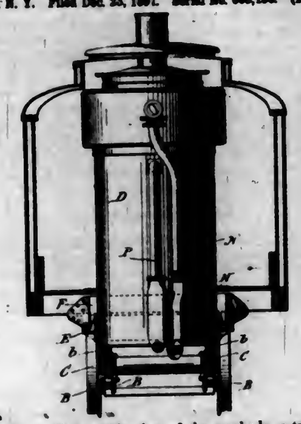
3. In propelling mechanism for bicycles and the like, the combination of a fixed tubular bearing, a drive-wheel mounted upon the said bearing, an axle journaled within the tubular bearing and provided at its ends with cranks, a crank-axle, pitmen connecting the arms of the crank-axle with the cranks of the drive-wheel axle, an idle-shaft having differential gearing, and independent connections between the elements of the said differential gearing and the drive-wheel and its axle, substantially as described.

603,282. SHEDDING-MOTION FOR LOOMS. GEORGE OLDHAM, Philadelphia, Pa. Filed Jan. 14, 1895. Serial No. 534,804. (No model.)



Claim.—1. In a heddle-motion for looms, the combination of the notched bell-crank levers or jacks constructed as described, notched draw-bars adapted to operate said jacks, transverse knives adapted to operate the draw-bars, and a locking-frame, with an eccentric gear adapted to operate the knives, an operating-rod adapted to raise and lower the locking-frame, a lever pivoted to the loom-frame and adapted to raise and lower the operating-rod, and a cam carried by the eccentric gear and adapted to operate the lever, substantially as and for the purposes described.

2. In a heddle-motion for looms, the combination of the jacks, a shouldered rib formed on said jacks radially to the point of support, notched draw-bars adapted to operate the jacks, transverse knives adapted to operate the draw-bars, and a locking-frame adapted to engage the shoulders of the rib of the jacks, with the eccentric gear adapted to operate the knives, an operating-rod adapted to raise and lower the locking-frame, a lever pivoted to the loom-frame and adapted to raise and lower the operating-rod, a roller carried by said lever, and a cam carried by said eccentric gear and adapted to bear against said roller to thereby raise the lever, substantially as and for the purposes described.



603,283. ELECTRIC-ARC LAMP. TIMOTHY H. PETTENGILL, Amsterdam, N. Y. Filed Sept. 7, 1897. Serial No. 650,795. (No model.)

Claim.—1. In an arc-lamp, the combination with the coarse and fine wire coils, the starting-coil, bridge-contacts and circuit connections, of the armature-lever, an insulated cut-out contact carried thereby, a circuit connection from said contact to the terminal of the coarse coil adjacent to the bridge-contacts, and a short-circuiting contact against which the first-named contact is drawn when the armature-lever is brought to its lowest position, substantially as and for the purpose set forth.

2. A cut-out device adapted to be inserted in a lamp of the character described, and consisting of the plate P having the slots p^1, a cut-out contact as p^3, the stud p, and an adjustable screw-contact p', in combination with the armature-lever F' upon which it is mounted, and from which it is insulated, the retaining-screws working in the slots p^1, the circuit connections, and the cut-out contact of the trimmer's switch X on the frame of the lamp against which the contact p^3 works, substantially as and for the purpose set forth.

603,284. STEAM-PROPELLED CAR. ALBERT J. PITKIN, Schenectady, N. Y. Filed Dec. 23, 1897. Serial No. 663,120. (No model.)

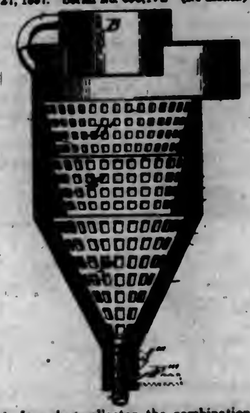
Claim.—1. The combination of the car-body, a truck, a boiler extending through the floor of the car-body resting on and supported directly by the truck, and having its axis coincident with the axis about which the truck turns, an annular casting concentric with the boiler surrounding it and secured to the car-body, an annular casting resting on and supported by the truck and sustaining the weight of the car-body, and having its axis coincident with the axis of the boiler, ball or roller bearings interposed between the two castings, a steam-engine mounted on the truck outside the car-body and rigid steam-pipes formed with flattened portions extending through an elongated opening in the lower casting and connecting the engine with the boiler and with the exhaust.

2. The combination of the car-body, the car-truck, a steam-boiler, an annular casting resting on the truck, another annular casting surrounding the boiler and secured to the car-body, ball or roller bearings interposed between the two castings and clips (such as J) permitting the castings to have a slight vertical movement relatively to each other but which prevent their separation.

3. The combination of a car-body, the car-truck, the boiler, a lower casting having an annular grooved flange containing balls or rollers and laterally-projecting brackets which rest on the frame of the truck, and an upper casting having a downwardly-projecting flange resting on the balls or rollers and secured to the car-body.

4. The combination of the truck-frame, the axle-boxes, the beams resting on the axle-boxes, springs secured to the beams and connected with the truck-frames, a boiler resting on the frames, a lower annular casting also resting on the truck-frames, an upper annular casting connected with the car-body, ball or roller bearings interposed between the two castings, steam-cylinders supported on the truck-frames, a steam-pipe extending through a vertical opening in the lower casting and connected with the boiler and with the steam-cylinders, and valve-gearing supported by the truck-frame.

5. The lower casting herein described, formed with a vertical annular portion adapted to surround a cylindrical boiler, and with a laterally-projecting flange having a vertical flanged portion formed with a ball-groove, said lateral flange being formed with elongated openings for steam-pipes, &c., substantially as described.



6. The herein-described lower casting formed with a circular opening to accommodate a cylindrical boiler, an annular ball-groove, an opening to accommodate a steam-pipe, and laterally-projecting brackets adapted to be connected with the truck-frame.

7. The combination of the truck-frame, the car-body, the boiler extending through the car-body, the upper casting secured to the car-body, the lower casting secured to the truck-frame, a steam-cylinder supported by the truck-frame, and a steam-pipe connected with the cylinder and with the boiler, said steam-pipe having a flattened portion extending through an elongated opening in the lower casting.

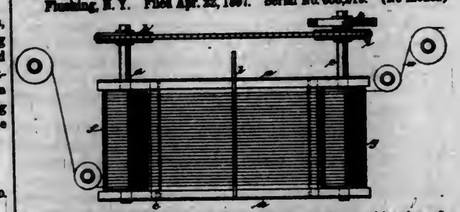
8. The combination of the wheels, axles, and axle-boxes of the side frames of the truck, the spring-supporting beams resting on the axle-boxes, spring carried by said beams and connected with the side frames of the truck, a cylindrical boiler resting on the side frames of the truck, a circular casting also resting on the side frames, another casting secured to the car-body and resting on the first-mentioned casting, steam-cylinders carried by the truck outside the car-body, valve-gearing supported by the lower casting, and a rigid steam-pipe connected with the cylinders and the boiler, and passing through an opening in the lower casting.

9. The combination of the car-body, the car-wheels, their axles, the axle-boxes arranged between the wheels, the spring-supporting beams resting on the axle-boxes, springs carried by said beams and connected with the side frames of the truck, a cylindrical boiler resting on the side frames of the truck, a circular casting also resting on the side frames, another casting secured to the car-body and resting on the first-mentioned casting, and steam-cylinders carried by the truck outside the car-body.

603,285. DUST-COLLECTOR. OTTO FORSECK, St. Louis, Mo. Filed Sept. 27, 1897. Serial No. 653,174. (No model.)

Claim.—1. In a dust-collector, the combination with an outer cylindrical casing, of a series of conical walls arranged in said casing, said walls forming a connected series of separating-chambers, the walls of the different cones being formed with different-sized perforations, and walls or partitions extending from the converging ends of the upper cones, to the casing, forming individual collecting-chambers, substantially as described.

2. The combination with the outer casing of a dust-collector, of a series of individual collecting-chambers within said casing, a connected series of perforated separating-chambers superimposed one above the other and cooperating with said individual collecting-chambers respectively, and means for adjusting the size of the perforations of the separating-chambers.

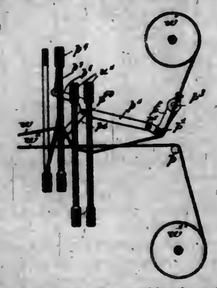


3. The combination with the outer casing of a dust-collector, of a series of individual collecting-chambers therein, and a superimposed series of connected separating-chambers cooperating with said collecting-chambers, said separating-chambers comprising conical side walls, having perforations therein, sleeves surrounding said side walls and formed with perforations adapted to register with the perforations in the side walls, and means for moving said sleeves to change the size of the perforations; substantially as described.

4. In a dust-collector, the combination with the outer casing, of a series of individual collecting-chambers having separate outlets, a series of connected separating-chambers cooperating with said collecting-chambers, said separating-chambers having adjustable perforations, means for individually adjusting said perforations in the different separating-chambers, said means extending to the outside of the casing, an air-outlet, and a pipe leading from a point in proximity to the air-outlet to the interior of the casing at a point above the uppermost separating-chamber; substantially as described.

5. In a dust-collector, the combination with the outer casing, of a series of individual collecting-chambers having separate outlets, a series of connected separating-chambers cooperating with said individual collecting-chambers, said separating-chambers having adjustable perforations, means for individually adjusting said perforations in the different separating-chambers, said means extending to the outside of the casing, an air-inlet, and a spiral way leading from the lowermost of said collecting-chambers to the outlet of said chamber; substantially as described.

6. In a dust-collector, the combination with the outer casing, of a series of connected separating-chambers, a series of individual collecting-chambers, and means for controlling communication between the several collecting-chambers, whereby the machine may be used as a general, or individual, collecting-chambered machine; substantially as described.



603,286. ELECTROPLATING APPARATUS. LOUIS POTTHOFF, Flushing, N. Y. Filed Apr. 22, 1897. Serial No. 633,219. (No model.)

Claim.—1. In an electroplating apparatus, the combination of a bath, a frame contained therein and comprising side bars *a*, bearings *b* and cross-bars *c*, a plurality of shafts, rollers *f* located on the shafts between the side bars of the frame, and one or more guiding combs of conducting material for guiding the wire, one or more anodes and circuit connections for the anodes and combs, substantially as described.

2. In an electroplating apparatus for electroplating wire, the combination of a framework carrying rollers, a conducting-comb carried by the framework for conducting current from the wires and for maintaining separate turns of the wires apart, a vat surrounding the said framework, comb and rollers, one or more anodes contained in the vat, and circuit connections to the anode or anodes and comb, substantially as described.

603,287. LOOM FOR CROSS-WEAVING. WILLIAM H. REDDING, Worcester, Mass., assignor to the Crompton & Knowles Loom Works, same place. Filed May 15, 1896. Serial No. 591,606. (No model.)

Claim.—1. In a loom, the combination with a vibrating guide and actuating means therefor, of means to at times resist vibration of the said guide, substantially as described.

2. In a loom, the combination with a vibrating warp-guide, and actuating means therefor, of connections between said guide and the loom-frame to relieve said actuating means from the tension of the warp-threads on said guide, substantially as described.

3. In a loom, the combination with the warp-guide, a stationary support and jointed levers connecting said guide and support, of means to relatively move said jointed levers to thereby vibrate said guide, substantially as described.

4. In a loom, the combination with a warp-guide, a stationary support, and toggle-levers connecting said guide and support and normally receiving the tension of the warp threads on said guide, of means connected with a moving part of the loom to relatively move said toggle-levers to vibrate said guide, substantially as described.

5. In a loom, the combination with the harness-frames, a warp-guide, a stationary support, and toggle-levers connecting said guide and support, of a connection between said toggle-levers, and a harness-frame for moving the former by the latter, substantially as described.

6. The combination with a loom-frame, the harness-frames, the warp-beams, and the warp-guides, one of which is capable of vibration, of toggle-levers connecting said vibrating guide with said loom-frame, and connections between said toggle-levers, and a harness-frame for moving the former by the latter, substantially as described.

7. In a loom, the combination with a harness-frame, its harness-lever and an auxiliary harness-moving mechanism, of connections between said lever and frame and between the said moving mechanism and frame, for moving the latter by either the said lever or mechanism without necessary movement of the other, substantially as described.

8. The combination with a harness-frame, its harness-moving lever, and an auxiliary frame-moving mechanism, of a rigid connection interposed between the said frame and said lever and auxiliary mechanism, through which movement is transmitted to said frame by said lever and auxiliary mechanism, substantially as described.

9. The combination with a harness-moving lever, and the auxiliary frame-moving mechanism having an arm, of a rigid link device adapted to be engaged by either the said lever or arm, and when moved by either, having a sliding movement with relation to the other, the harness-frame and connections between the same and said rigid link device, substantially as described.

10. In a loom of the class described, the combination with a harness-actuator, a harness-frame, and harness connections engaging with the said harness-actuator, the said harness-actuator operating to transmit full-length movements to the harness-frame, of devices connected with the said harness connections, to communicate a half-and-return movement to the said harness-frame without imparting movement to said harness-actuator, substantially as described.

11. In a loom of the class described, the combination with a harness-actuator, a harness-frame, and harness connections having an elongated loop to engage with the said harness-actuator, the said harness-actuator operating to transmit full-length movements to the harness-frame, of a half-stroke lifting device engaging with the said harness connections to communicate a half and return movement to the said harness-frame, substantially as described.

608,288. SNAP-HOOK. ANDREW RYAN, Grand Rapids, Minn. Filed Mar. 24, 1897. Serial No. 628,943. (No model.)

Claim.—1. In a hook the combination with the hook proper and its shank and stem, of a spring-tongue secured thereto, a block secured to the spring-tongue and supported on the stem and movable transversely to a longitudinal plane including the hook proper and stem and adapted normally to close the opening between the hook and the stem, a lug on the block, and a stop on the stem against which the lug is adapted to strike to limit the side motion of the block in opening the hook.

2. In a snap-hook, the combination with the hook proper and its stem, of a spring-tongue secured on the side of the stem, a block secured to said spring-tongue and supported on the stem and movable transversely to a longitudinal plane including the hook proper and the stem and adapted normally to close the opening between the hook proper and the stem, a stop on the stem, a lug on the block adapted to strike against the stop on the stem, said block working beside said stop on the stem and constituting a protecting means therefor, substantially as described.

603,289. BICYCLE-FRAME. BENJAMIN F. RYDER, New York, N. Y. Filed Feb. 23, 1897. Serial No. 624,707. (No model.)

Claim.—1. In a bicycle-frame, a circular portion forming the center, and having secured thereto a head attachment for the handle-bars, an attachment for the seat-posts or rear fork, and an attachment for the crank-shaft, substantially as described.

2. In a bicycle frame, a central portion formed of a tube bent in circular form, and having secured thereto a clamp or bracket for union with the head attachment for the handle-bar, a clamp or bracket for the reception of the seat-post and rear-fork or saddle-post braces, and a clamp or bracket for the crank-shaft, substantially as described.

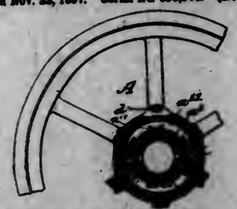
3. The combination in a bicycle-frame, having a steering-head, saddle-post brace or rear fork, and lower reaches, of a circularly-bent tube, a clamp or bracket secured to said tube and having a sleeve to receive the steering-head, a clamp or bracket having a saddle-post socket, and a clamp or bracket having a tubular crank-bearing and means for connection with the lower reaches, substantially as described.

4. The combination in a bicycle-frame, having a steering-head, saddle-post braces and lower reaches, of a circularly-bent tube, a clamp secured to said tube and having a sleeve to receive the steering-head, a clamp or bracket having a saddle-post socket, and means to clamp it about such post and the rear fork or stays, and a clamp having a tubular crank-bearing, and a rear extension by means of which the lower reaches are supported, substantially as described.

5. In a bicycle-frame, the central portion constructed of a tube, bent in the form of an arc of a circle, and having secured thereto a head attachment for the handle-bars, an attachment for the seat-post and rear fork or braces, and an attachment for the crank-shaft, substantially as described.

6 A frame, for a tandem bicycle, having the central portion made of two or more tubes bent in circular form and connected to one another, combined with head attachments for the handle-bars, attachments for the seat-posts and rear forks or braces, and attachments for the crank-shafts, substantially as described.

603,290. WRENCH. HUBERT M. SMITH, New York, N. Y. Filed June 9, 1897. Serial No. 639,974. (No model.)



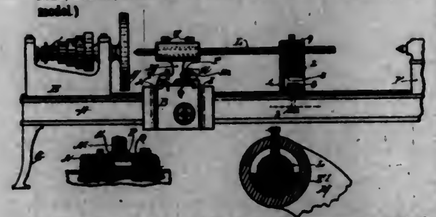
Claim.—1. A wrench, comprising a rod having a rack on the rear edge thereof, a fixed jaw extended at right angles to the rod, and a sliding apertured jaw mounted on said rod, said jaw having a toothed surface formed at the rear upper end thereof for engagement with the said rack, and a convex surface extended downwardly from the said toothed surface, whereby the teeth may be swung out of engagement with the rack, and a spring for maintaining the sliding jaw normally at right angles with the said rod, substantially as shown and described.

2. In a wrench, the combination of a rod having a fixed jaw extended at right angles therefrom, a rack formed upon the rear edge thereof, and a sliding jaw engaging with the said rod, said jaw having a toothed surface for normally engaging with the said rack and a convex surface extended from said toothed surface, and a spring in the shank adapted to engage the rod for maintaining the sliding jaw in operative position, substantially as shown and described.

3. In a wrench, the combination of a sliding jaw and a rod having a fixed jaw extended at right angles therefrom, said rod having a rack formed on the rear edge thereof, said jaw having a convex end portion provided with teeth on the upper part thereof and the lower part smooth, adapted for use as a bearing for the jaw when disengaged from the rack, the free end of the jaw having a beveled inner surface and a U-shaped spring connected to the said free end and bearing normally upon the said rod, whereby the jaw is normally maintained at right angles with the rod, substantially as shown and described

---

608,291. SELF-LUBRICATING CAR-WHEEL. WILLIAM T. SNYDER, Catasauqua, Pa., assignor of one-half to James W. Fuller, same place. Filed Nov. 22, 1897. Serial No. 659,571. (No model.)



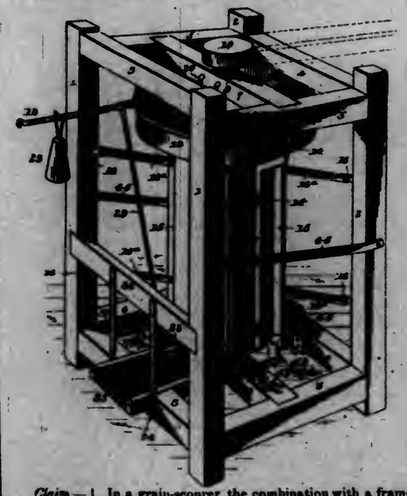
Claim.—In a self-lubricating wheel or pulley, a hub having an internal lubricating-chamber divided into two compartments, the points of junction of which are formed by converging or break walls, said hub having in its bearing-surface an irregular-shaped groove or duct, said duct communicating by two sets of perforations with the lubricating-chamber, one set of perforations leading to the points of junction of the two compartments of said chamber and the other set leading directly to each compartment, whereby during the rotation of the hub the lubricant is first conducted by the break walls into the groove or duct and thereafter by centrifugal force is conducted from said groove or duct directly to the compartments of the lubricating-chamber, substantially as and for the purposes described.

608,292. SELF-LUBRICATING CAR-WHEEL. WILLIAM T. SNYDER, Catasauqua, Pa., assignor of one-half to James W. Fuller, same place. Filed Nov. 22, 1897. Serial No. 659,572. (No model.)

Claim.—In a car-wheel, a hub having a transversely-chambered head A', provided with a vertically-arranged opening *d*, said head adapted to receive the thrust end of the axle or journal, a key adapted to be inserted in said opening *d*, and rigidly held therein, and a cap-plate or cover E, having a seat *e*, adapted to close the opening *d*, and to lock the key within said opening, substantially as and for the purposes described.

608,293. BORING-BAR DEVICE FOR LATHES. FREMONT STARRETT, Denver, Colo. Filed Dec. 21, 1897. Serial No. 662,981. (No model.)

Claim.—1. In a boring-bar for lathes the combination with the lathe-carriage of a bracket slidably dovetailed to the guideway of the carriage, means for clamping the bracket to the carriage at any desired part of the guideway, a sleeve portion to said bracket, a bore through said sleeve portion adapted to support a suitable boring-bar, in axial alinement with the lathe's centers, and a dowel-pin positioned in said bracket and extending into said carriage and arranged and adapted to key said brackets to said carriage in a position to bring its boring-bar supporting bore in exact alinement with the lathe's centers, substantially as described.



2. In a boring-bar for lathes, the combination with the lathe-carriage of the bracket fitted slidably to the slideway of said carriage to move transversely of the lathe's bed, means including a gib-key for securing said bracket at any desired part of the slideway, a bore through the upper end of said bracket in exact axial alinement with the lathe's centers, a boring-bar of smaller diameter than said bore, a suitable cutter in said bore, a semicircular sleeve fitting accurately said bore and supporting said bar and of a thickness to bring the axis of said bar in axial alinement with the centers of the lathe, and means including a bevel-pin for positively, accurately and quickly shifting and locking said bracket and bar in exact alinement with the center of the lathe, substantially as described.

3. In a boring-bar for lathes, the combination with the slideway of the lathe's carriage of the bracket, the downwardly-projecting integral guideway-rib, the loose opposing gib adapted to fit the opposite side of the slideway of said carriage, the tightening set-screws, the dowel-pin, the bore in the upper end of said bracket, the semicircular sleeve fitting said bore and the boring-bar having a double-ended cutter in its end arranged and adapted with its cutting edges extending beyond and clear of the body of said boring-bar, substantially as described.

4. In a lathe boring-bar, the combination of the cutter-bar having a cutter arranged with its cutting-lips extending forward beyond the body of the bar, a bracket adapted to be shiftably clamped to the transverse slideway of the lathe's carriage a bore through said bracket in exact horizontal alinement with the centers of the lathe, and of larger diameter than the said cutter-bar, a semicircular-shaped sleeve or seat-support fitting accurately said bore and said bar, and a taper-key for locking said bracket in exact alinement with the lathe's centers, with a rear rest for said bar comprising a bed-plate adapted to be clamped to the bed of the lathe, a slot or guideway in said bed-plate, a block arranged to slide transversely of the lathe's bed on said bed-plate and fitted to said guideway a bore in said block larger than said cutter-bar, a sleeve operatively fitting said bar and said bore, a lug and screw on said bed-plate for defining the center position of said bore and means for clamping said block to said bed-plate, substantially as described.

5. The combination of the boring-bar having a transverse slot therethrough adjacent to its end, the cutter fitting in said slot and projecting beyond the body of the bar, the wedge for securing said cutter in place, the bracket, means for securing the bracket shiftably to the lathe's carriage, the semicircular seat-supports arranged and adapted to fit said bracket and various sizes of boring-bars with the rear support comprising the bed-plate, the adjustable block and the interchangeable sleeves. substantially as described.

608,294. GRAIN-SCOURER. COLUMBUS STONE, Home, Tenn., assignor of one-sixth to James Armitage, Greenville, Tenn. Filed Aug. 12, 1897. Serial No. 647,902. (No model.)

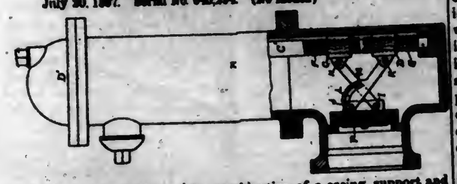
Claim.—1. In a grain-scourer, the combination with a frame, of a cylinder supported within the frame to have limited vertical but no rotary movement, a vertical shaft supported to rotate in said cyl-

inder, a plurality of scouring-blades secured to the cylinder within it, a plurality of scouring-blades radiating from the shaft to work between the blades on the cylinder, and means to automatically control the vertical movement of the cylinder, substantially as described.

2. In a grain-scourer, the combination of the frame, a cylinder supported to have a limited vertical movement within the frame, and having a plurality of vertical series of horizontal scouring-blades firmly secured therein, a vertical shaft journaled to rotate in said cylinder, a plurality of vertical series of horizontal scouring-blades carried by said shaft to work between said fixed blades, each blade being wedge shaped in cross-section and provided with an abrading-surface on opposite faces, and the thin edges of the rotating blades opposing the thin edges of the fixed blades, and tie-bars connected to the cylinder and frame to prevent rotary movement of the cylinder, substantially as described.

3. In a grain-scourer, the combination with the frame, a cylinder supported to have limited vertical movement within the frame, said cylinder being provided with a series of fixed scouring-blades and with a discharge-opening at its lower end, and a shaft provided with a series of scouring-blades, journaled to rotate within said cylinder, of a scale-beam fulcrumed on the frame and connected at one end to the cylinder, a weight adjustable on the other end of the beam, a door to close the discharge-opening, and connections between the weighted end of the beam and said door, substantially as described.

4. In a grain-scourer, the combination with the frame, and a scouring-cylinder provided with a discharge-opening at its lower end, of parallel series of radiating links pivotally connected at their ends to the cylinder and frame, respectively, to permit a limited vertical movement of the cylinder within the frame, a scale-beam fulcrumed on the frame and connected at one end to the cylinder, a weight adjustable on the other end of the beam, a door to close the discharge-opening, and connections between the weighted end of the beam and said door, substantially as described.



5. In a grain-scourer, the combination of a cylinder supported to have limited vertical movement but no rotary movement and having a plurality of vertical series of scouring-blades projecting inwardly toward its center, of a vertical shaft supported to rotate in the axial center of the cylinder, a plurality of vertical series of scouring-blades radiating from said shaft to work between the blades of the cylinder parallel thereto, each blade being wedge-shaped in cross-section and provided with an abrading-surface on its upper and lower sides, and the thin edges of the fixed blades opposing the thin edges of the moving blades, and means to automatically control the vertical movement of the cylinder, substantially as described.

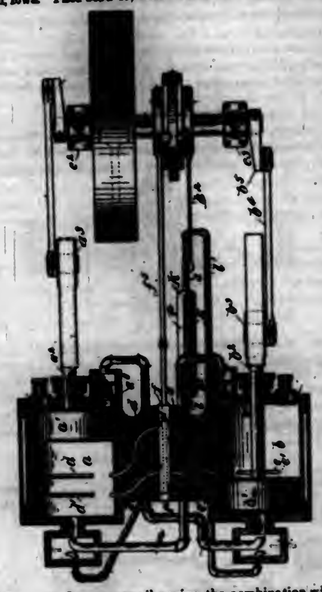
6. In a grain-scourer, the combination with a frame, of a cylinder supported within the frame to have limited vertical but no rotary movement, and having a discharge-opening at its lower end, a movable door to close said opening, a vertical shaft supported to rotate in said cylinder, a plurality of series of scouring-blades secured to the cylinder within it, a plurality of series of scouring-blades radiating from the shaft to work between the blades on the cylinder parallel thereto, means to automatically control the vertical movement of the cylinder and also to operate the door of the discharge-opening, and a sifting device on which the grain is discharged, substantially as described.

7. In a grain-scourer, the frame, a weighted beam fulcrumed at the top of the frame, a self-adjusting vertically-movable scouring-cylinder suspended from one end of the weighted beam and having a discharge-opening, a movable closure for said opening, a connection between said closure and the weighted beam, and scouring devices arranged within the cylinder, substantially as set forth.

8. In a grain-scourer, the frame, an oscillatory weighted beam fulcrumed at the top of the frame, a scouring-cylinder suspended from one end of the beam and having a movable discharge-door and a plurality of pivotal link connections with the frame, a connection between said door and the weighted beam, and scouring devices arranged within the cylinder, substantially as set forth.

608,295. FIRE HYDRANT. CHARLES A. SULSMAN, Waterford, N. Y., assignor of one-half to John Knickerbacker, Troy, N. Y. Filed July 20, 1897. Serial No. 645,294. (No model.)

Claim.—In a hydrant the combination of a casing, support and actuator for the lever end supports, lever end supports, levers attached to said lever end supports and to the valve, a valve to close the inlet-opening in the casing, a pin on one of said levers arranged to work in a groove on the other lever, substantially as set forth.



608,296. GILDING CHINA, EARTHENWARE, OR PORCELAIN ARTICLES. GEORGE W. TOOKER, New York, N. Y. Filed Aug. 7, 1897. Serial No. 647,402. (Specimens.)

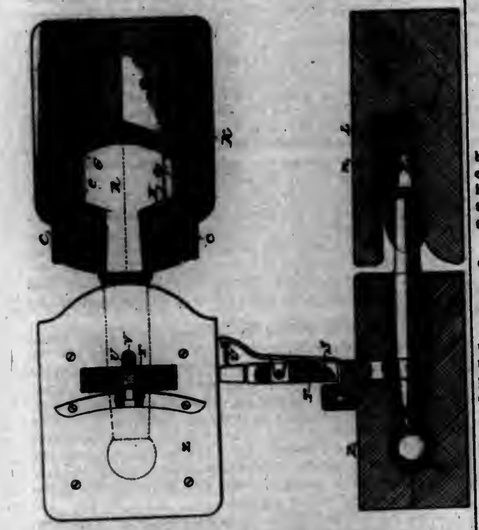
Claim.—1. The process hereinbefore described of gilding plain-finished china, earthenware and porcelain articles, which consists in, first, applying precipitate of gold to the article, second, firing the article, third, burnishing the gold surfaces, fourth, applying the glaze substance to cover the gold decorations, and, fifth, again firing the article but at a lower temperature than the previous firing to fuse the glaze substance; substantially as set forth.

2. The process hereinbefore described of gilding plain-finished china, earthenware and porcelain articles, which consists in, first, applying the precipitate of gold to the article, second, firing the article, third, burnishing the gold surfaces, fourth, applying the grounding-oil and glaze substance to cover the gold decorations, and, fifth, again firing the article, but at a lower temperature than the previous firing to fuse the glaze substance; substantially as set forth.

3. As a new article of manufacture, a china, earthenware or porcelain article comprising as an integral structure the main body, the glaze substance covering and integral with said body, the decoration in precipitate of gold on said glaze covering, and the thin glaze substance over said gold decoration and integral therewith and with said glaze covering, the whole being of the character and construction described.

608,297. OIL OR GAS ENGINE. WALTER F. TROTTER, Marshalltown, Iowa. Filed Sept. 13, 1895. Serial No. 562,422. (No model.)

Claim.—1. In a gas or oil engine, the combination with two cylinders of a mixing or explosion chamber for each cylinder communicating with one end thereof by a constricted passage, an inlet-valve at the opposite or air-feeding end of each cylinder, a pipe or duct extending from the air-feeding end of each cylinder to the other cylinder and opening into the cylinder at the end which communicates with the mixing-chamber, means for maintaining said ducts open during the return stroke of the piston in the cylinder to which the air is fed, and closed during the forward stroke, a fuel-inlet for each of said mixing-chambers for supplying fuel directly thereto, an exhaust-port in each of said cylinders situated at an intermediate portion of the cylinder whereby the admitted air and the returning piston coact in ejecting the exploded gases from the cylinder, and means for closing the exhaust-port at a predetermined point in the return stroke, whereby air is drawn into the air-feeding end of each cylinder on the return stroke and on the forward stroke the air assists the working piston of the other cylinder in driving out the burned gases during part of the stroke and during the remainder of the stroke the pistons of both cylinders act in forcing fresh air into the combustion-chamber of the cylinder whose piston is next to make a working stroke, substantially as described.



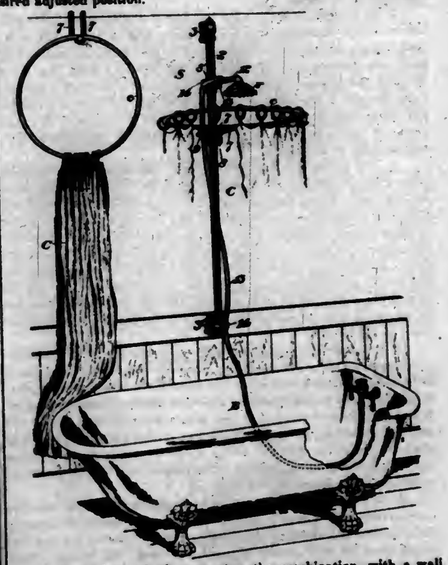
2. In a gas or vapor engine, the combination with a cylinder, of two exhaust-ports leading therefrom, and means for opening one or both of said exhaust-ports according as the load on the engine is great or small; substantially as described.

3. The combination with two cylinders, each provided at one end with a mixing-chamber communicating with the opposite end of the other cylinder, each of said cylinders being provided with two exhaust-ports, of means for opening one or both of said exhaust-ports according as the load on the engine is great or small; substantially as described.

4. In a gas or oil engine, the combination with two cylinders of two pumps, one provided in connection with each of said cylinders for feeding oil or other fuel thereto, the plungers of said pumps being arranged to alternately perform their working strokes, an eccentric for operating both of said pumps and a governor for varying the throw of said eccentric, substantially as described.

5. In a gas or vapor engine, the combination with a cylinder, of a pump for feeding the fuel thereto, an eccentric for operating said pump, said eccentric being mounted upon a pivoted or swinging arm and a governor for rocking said pivoted arm upon its pivot to vary the throw of the eccentric and thereby the stroke of the pump; substantially as described.

603,298. CAR-COUPLING. PETER ULLMAN, Stafford, Ohio. Filed Mar. 17, 1897. Serial No. 626,942. (No model.)



Claim.—1. The combination for automatically coupling moving cars consisting of a blunt arrow-head set at about forty-five degrees (45°) and moving through openings between flanges, and adapted to be caught above by one and below by two horizontal springs which press said arrow-head horizontal, and flanges with which the jaws of the arrow-head engage, substantially as set forth.

2. The contrivance for emergency release consisting of said blunt arrow-head, of said three (3) springs N, G, and H, located above and below in the opposing draw-head and adapted to be compressed by the pressure of overturning car on arrow-head, and of openings above and below said flanges from which openings the arrow-head escapes, substantially as set forth.

603,299. SHOWER-BATH APPARATUS. WILLIAM VANDERMAN, Willimantic, Conn. Filed Sept. 13, 1897. Serial No. 651,902. (No model.)

Claim.—1. In a shower-bath apparatus, the combination, with a carrier adapted to be secured to a wall and having a pair of parallel horizontal apertures therein, of a curtain-holder having a pair of parallel horizontal arms adapted to enter the apertures in said carrier.

2. In a shower-bath apparatus, the combination, with a carrier-rod adapted to be secured to a wall, of a clamp having a pair of parallel horizontal apertures therein; a curtain-holder having a pair of parallel horizontal arms adapted to enter the apertures in said clamp and adjustable therein; and means for securing said arms in any desired adjusted position.

3. In a shower-bath apparatus, the combination, with a wall bracket or fixture embodying carrying means, of a rose-head and a curtain-holder both adjustable in a vertical direction and also in a horizontal direction on said carrying means, and means for securing the rose-head and the curtain-holder in any desired adjusted positions.

603,300. PROCESS OF MAKING CARBOXYLATED PRODUCTS OF TRIPHENYLMETHANE. HENRI R. VIDAL, Paris, France. Filed July 24, 1897. Serial No. 645,859. (Specimens.) Patented in France Feb. 24, 1897, No. 264,234, and in England Mar. 2, 1897, No. 5,535.

Claim.—The process of making mono and di carboxylated products derived from phenolic and amidated compounds of triphenylmethane, by heating a mixture of phenol and the compound of triphenylmethane in presence of condensing agents such as oxalic and sulfuric acid, substantially as described.

608,301. MATCH-SAFE. JOHN VILLARD and JAMES P. HENDERSON, Bonham, Tex. Filed Oct. 18, 1897. Serial No. 655,605. (No model.)

Claim.—1. In a match-safe, the combination with an outer casing provided with a match-delivery slot in one of its sides, of a match-holding compartment within the casing, a slotted sliding plate to receive matches singly from the said compartment, a pivoted disk to receive the match from the plate and carry it to said slot, and means to reciprocate the sliding plate, and to turn the disk on its pivot, substantially as described.

2. In a match-safe, the combination with the outer casing provided with a match-delivery slot in one of its sides, of a match-holding compartment within the casing having a bottom formed of in-

clined sections with a space between their lower ends, a slotted plate supported to slide below the said compartment and to receive the matches singly therefrom in its slot, a pivoted disk to receive the match from the plate and carry it to said delivery-slot, and means to reciprocate the sliding plate and to turn the disk on its pivot, substantially as described.

3. In a match-safe having a delivery-slot in its side, the combination with a match-holding compartment having an opening in its bottom and a sliding plate having a slot to receive the matches singly from said compartment, of a pivoted disk having a fixed jaw and a movable jaw, means to rotate the disk and move the sliding plate to cause the slot in the latter to register with the said jaws and deliver the match between them, devices to actuate the movable jaw, and means to rotate the disk to present the match in the delivery-slot, substantially as described.

4. In a match-safe having a delivery-slot in its side, the combination with a match-holding compartment having an opening in its bottom, and a sliding plate having a slot to receive the matches singly from said compartment, of a pivoted disk having a fixed jaw and a spring-actuated movable jaw, a bar connected to the said movable jaw, means to rotate the disk and move the sliding plate to cause the slot in the latter to register with the said jaws, a stop to engage the bar on the movable jaw to separate the latter from the fixed jaw, to permit the match to fall from the slot between the jaws, and means to rotate the disk to present the match in the delivery-slot, substantially as described.

5. In a match-safe having a delivery-slot in one of its sides, the combination with a match-holding compartment, having an opening in its bottom and a sliding plate having a slot to receive the matches singly from said compartment, of a pivoted disk to receive the match from the plate and carry it to said slot, a lever pivoted within the safe and projecting through a slot in one of its sides, links pivoted to the lever and to the disk and sliding plates respectively, and a spring connected to the lever and safe to move the lever in one direction, substantially as described.

6. In a match-safe having a delivery-slot in one of its sides, the combination with a match-holding compartment having an opening in its bottom and a sliding plate having a slot to receive the matches singly from the said compartment, of a pivoted disk having a fixed jaw and a spring-actuated movable jaw, the opposing faces of said jaws being roughened, means to rotate the disk and move the sliding plate to cause the slot in the plate to register with said jaws and deliver the match between them, and means to rotate the disk and cause it to present the match in the delivery-slot, from which it may be withdrawn from between the roughened jaws and ignited during the withdrawal, substantially as described.

603,302. GIN-SAW-FILING MACHINE. JAMES H. WALTERS, Mooresville, N. C., and WILLIAM H. WALTERS, Waynesborough, Ga. Filed Oct. 28, 1897. Serial No. 656,664. (No model.)

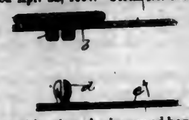
Claim.—1. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a rocking plate, bearing in opposite directions against said carriers and adjustable means for yieldingly holding said plate in operative engagement with the carriers, substantially as specified.

2. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a fulcrumed plate bearing at its ends in opposite directions against said carriers, and a torsion-spring for actuating said plate, substantially as specified.

3. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a fulcrumed bearing-plate having its arms in contact with said carriers to yieldingly press them in opposite directions, a torsion-spring, for actuating said plate, provided with an adjusting-disk, and means for securing the said adjusting-disk at the desired adjustment, substantially as specified.

4. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a fulcrumed bearing-plate terminally arranged to bear in opposite directions against the file-carriers, a torsion-spring terminally connected to the bearing-plate, a revoluble adjusting-disk attached to the opposite end of the torsion-spring, and a clamping or jam nut arranged in operative relation with the adjusting-disk, substantially as specified.

5. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a fulcrumed bearing-plate arranged to bear at its extremity in opposite directions against the carriers, a coiled torsion-spring connected at one end to the bearing-plate, an adjusting-disk connected to the opposite end of the said spring and capable of revoluble and axial adjustment, and means for locking said disk at the desired adjustment, substantially as specified.



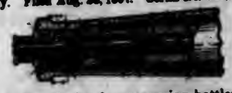
6. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers, and operating devices, of a fulcrumed bearing-plate arranged to bear terminally in opposite directions against said carriers and capable of axial yielding movement approximately parallel with the paths of the carriers, an actuating-spring for holding said bearing-plate torsionally and axially in its normal position, and adjusting devices for said actuating-spring, substantially as specified.

7. In a saw-filing machine, the combination with reciprocatory laterally-movable file-carriers and operating devices, of saw-feeding mechanism including a slide or plunger mounted for reciprocation in a plane approximately parallel with the file-carriers, a spring for returning the slide or plunger and yieldingly holding it in its normal position, operating devices for periodically advancing the slide or plunger, and a trip-yoke pivotally mounted at an intermediate point for swinging movement, and having parallel arms arranged in operative relation, respectively, with diagonally-disposed surfaces of the file-carriers, and adapted, when actuated, to move said carriers laterally in opposite directions, said trip-yoke having a slotted connection with the slide or plunger, whereby the yoke is yieldingly held in its normal position by the return-spring of the slide, substantially as specified.

8. In a saw-filing machine, the combination with a supporting-frame, of a driving-gear, file-carriers operatively connected with the driving-gear, saw-feeding mechanism, including a spring-returned slide or plunger terminally arranged contiguous to the driving-gear, a cam mounted upon the driving-gear for radial and pivotal adjustment, and adapted for contact with the contiguous extremity of said slide or plunger, means for securing said cam at the desired adjustment to vary the extent and rapidity of throw of the slide or plunger, and a trip-yoke operatively connected with said slide or plunger and having arms arranged in operative relation with inclined surfaces on the file-carriers, substantially as specified.

9. In a saw-filing machine, the combination with a supporting-frame, of a driving-gear, file-carriers operatively connected with the driving-gear, saw-feeding mechanism, including a spring-returned slide or plunger terminally arranged contiguous to the driving-gear, a radially and pivotally adjustable cam carried by the driving-gear for contact with the contiguous extremity of said slide or plunger, and having a radially-disposed slot, a set-screw engaging said slot to secure the cam at the desired radial and pivotal adjustment, and a trip-yoke operatively connected with said slide or plunger and having arms arranged in operative relation with inclined surfaces on the file-carriers, substantially as specified.

603,303. GLOVE-FASTENER. JAMES V. WASHBURN, Waterbury, Conn. Filed Apr. 22, 1897. Serial No. 633,300. (No model.)



Claim.—1. In combination, the incurved band, the concave plate adapted to be forced into the grasp of said band with a pliable material between the two, and the part made integral with said plate and adapted for attachable and detachable cooperation with a corresponding member of a glove-fastener or the like, all substantially as described and for the purposes set forth.

2. In combination, the incurved band, the concave plate adapted to be forced into the grasp of said band with a pliable material between the two and the part made integral with said plate and forming a socket adapted for attachable and detachable cooperation with the stud of a glove-fastener or the like, all substantially as described and for the purposes set forth.

3. In combination, the incurved band, the slitted or notched plate adapted to be forced into the grasp of said band with a pliable material between the two, and the part made integral with said plate and adapted for attachable and detachable cooperation with a corresponding member of a glove-fastener or the like, all substantially as described and for the purposes set forth.

4. In combination, the incurved band, the slitted or notched plate adapted to be forced into the grasp of said band with a pliable material between the two and the part made integral with said plate and forming a socket adapted for attachable and detachable cooperation with the stud of a glove-fastener or the like, all substantially as described and for the purposes set forth.

603,304. BOTTLE-STOPPERING DEVICE. LE ROY C. WEBSTER, U. S. Navy. Filed Aug. 26, 1897. Serial No. 649,856. (No model.)

Claim.—1. In a device for stoppering bottles, jugs, and similar vessels, the combination with a stopper, and a hollow tube passing through an axial opening through said stopper and extending some distance below the said stopper, said tube being closed at its lower end and having a plurality of openings therein near said end; of a hollow plug inclosing the lower part of said tube and adapted to slide thereon; stops limiting the movement of said plug; a locking-disk encircling said tube beneath and near said stopper; and a flexible connection between said disk and said stopper, substantially as described.

2. In a device for stoppering bottles, jugs, and similar vessels, the combination with a stopper, and a hollow tube passing through an axial opening through said stopper and extending some distance below said stopper, said tube being closed at its lower end and having two non-communicating longitudinal chambers or passages therethrough with openings near the lower end of said tube leading to said chambers; of a hollow plug inclosing the lower part of said tube and adapted to slide thereon; stops limiting the movement of said plug; a locking-disk encircling said tube beneath and near said stopper; and a flexible connection between said disk and stopper, substantially as described.

3. In a device for stoppering bottles, jugs and similar vessels, the combination with a stopper, and a hollow tube, passing through an axial opening in said stopper and extending some distance below said stopper, said tube being closed at its lower end and having two non-communicating longitudinal chambers or passages therethrough, with an opening entering each chamber near the lower end of said tube, but the one being nearer said end than the other; of a hollow plug inclosing the lower part of said tube and having one or more ribs and grooves thereon, said hollow plug being adapted to slide on said hollow tube and to cover and uncover said opening therein; a locking-disk encircling said tube beneath and near said stopper and having an outer periphery similar to that of said hollow plug; and a flexible connection between said disk and stopper, substantially as described.

4. The combination with a bottle or jug, having a neck provided with a specially-formed contracted internal passage; of a stopper adapted to fit into said passage; a hollow tube passing through an axial opening in said stopper, and adapted to extend into the neck of the bottle or jug, said tube being closed at its lower end and having a plurality of openings near said end; a hollow plug inclosing the lower portion of said tube and adapted to slide thereon of its own weight and thus cover and uncover said openings; stops limiting the movement of said plug; a locking-disk having its periphery formed to correspond with the contracted passage in said neck; encircling said tube beneath and near said stopper; and a flexible connection between said locking-disk and said stopper: substantially as described.

5. The combination with a bottle or jug, having a neck provided with a specially-formed contracted internal passage; of a stopper adapted to fit into said passage; a hollow tube passing through said stopper and adapted to extend into the neck of the bottle or jug some distance, said tube being closed at its lower end and having a pair of openings therein near but at unequal distances from said end; a longitudinal partition dividing said tube into two non-communicating internal passages; a hollow plug inclosing the lower portion of said tube and adapted to slide thereon of its own weight, and thus cover and uncover said openings, stops limiting the movement of said plugs, a locking-disk having its periphery formed to correspond with the contracted passage in said neck encircling said tube beneath and near said stopper, and a flexible connection between said locking-disk and said stopper, substantially as described.

6. The combination with a bottle or jug, having a neck provided with a specially-formed contracted internal passage, of a stopper adapted to fit into said passage; a hollow tube passing through an axial opening in said stopper and adapted to extend some distance into the neck of the bottle or jug, said tube being closed at its lower end; a longitudinal partition in said tube dividing the latter into two non-communicating internal passages an opening in said tube communicating with one of said passages near the lower end of said tube; another opening communicating with the other of said passages at a greater distance from the end of said tube; a hollow plug having a periphery formed to correspond with the contracted passage in said neck, inclosing the lower portion of said tube and adapted to slide thereon of its own weight and thus cover and uncover said opening; stops limiting the movement of said plug; a locking-disk having its periphery formed to correspond with the contracted passage in said neck, encircling said tube beneath and near said stopper, and a spring-wire connection between said locking-disk and said stopper, substantially as described.

603,305. WRENCH. MARTIN WEBB, San Marcos, Tex. Filed May 15, 1897. Serial No. 636,667. (No model.)

Claim.—A device of the class described comprising a shank provided at one end with the laterally-offset integral handle portion 10 and having its other end reduced and threaded, said shank being provided between its reduced end and the handle portion 10 with screw-threads, the adjustable jaw slidingly mounted on the shank and provided with a transverse slot or bifurcation, an adjusting-nut fitting in the slot or bifurcation of the adjustable jaw and engaging the threads of the shank, the jaw 1 provided with an opening to receive the reduced end of the shank and adapted to be removed therefrom, whereby the movable jaw and the adjusting-nut may be placed on and removed from the shank, a nut engaging the reduced end of the shank and securing the jaw 1 to the same, and the member 12 pivoted to the shank adjacent to the inner end of the handle portion, substantially as described.

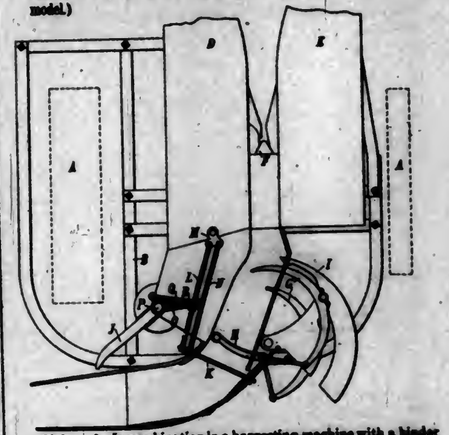
603,306. FACE AND NECK PROTECTOR. JACOB WEIL, Las Animas, Colo. Filed Nov. 6, 1897. Serial No. 657,673. (No model.)

Claim.—1. A face and neck protector, comprising a supporting-frame to fit over the head, neck and shoulders of the wearer and adapted to be sprung open on a vertical line at one side thereof said frame being formed in part of similarly-constructed strips pivoted at

their upper ends to each other and to a fixed part of the frame and having their lower ends connected to movable parts of the frame, a covering of wire-netting secured to the frame, and means applied to the said strips to lock the frame in its closed position, substantially as described.

2. A face and neck protector, comprising a supporting-frame to fit over the head, neck and shoulders of the wearer, said frame being formed in part of two strips of metal arranged one above the other on one side of the frame and pivoted together at their upper ends and to a fixed part of the frame, and connected at their lower ends to movable parts thereof, one strip having a series of headed pins and the other a series of loopholes to fit over said pins, and a covering of wire-netting to fit over said frame, substantially as and for the purposes specified.

3. A face and neck protector, comprising a skeleton frame adapted to fit over the head and neck of the wearer and having shoulder-yokes one of which is divided, said frame being formed of spring-wire and two superposed strips of spring sheet metal, connected at their lower ends to the respective sections of the divided shoulder-yoke, and pivotally connected together at their upper ends and to a fixed part of the frame, means to detachably lock the strips together, and a covering of wire-netting secured to the frame, said netting being divided on one side and secured to the respective metal strips, substantially as described.



4. A face and neck protector, comprising a skeleton frame adapted to fit over the head and neck of the wearer, and having a covering of wire-netting secured thereto, said frame and covering being adapted to open on a vertical line on one side thereof, and the frame having a shoulder-yoke at each side, one of the yokes being separable, and side strips connecting the parts of the separable yoke with the upper fixed part of the frame and straps at the lower ends of the yokes to fit under the armpits of the wearer, substantially as described.

5. In a protector for the head and neck, the combination of shoulder-yokes, one of which is separable at a medial point, side pieces conforming to the outline of the head, neck and shoulders and having their lower ends secured to the middle portion of the fixed shoulder-yoke and to the separable ends of the other shoulder-yoke, and having their upper ends meeting and pivotally connected, fastening means applied to the separable or complementary members of the side strips having connection with the separable shoulder-yoke, and wire-netting secured to the shoulder-yokes and side pieces, substantially as set forth.

6. In a head and neck protector, the combination of a fixed and a separable shoulder-yoke, and a side piece conforming approximately to the outline of the head, neck and shoulder secured at its lower end to the fixed shoulder-yoke, and corresponding side pieces composed of complementary members pivotally connected at their upper ends to each other and to the upper end of the first-mentioned side piece and having their lower ends secured to the upper terminals of the parts of the separable shoulder-yoke, fastening means applied to the complementary members of the separable side piece, front and rear brace-bars connecting correspounding end portions of the shoulder-yokes, means for securing the lower terminals of the shoulder-yokes and the outer extremities of the front and rear brace-bars, and a wire-netting secured to the shoulder-yokes, front and rear brace-bars and to the side pieces, substantially as set forth.

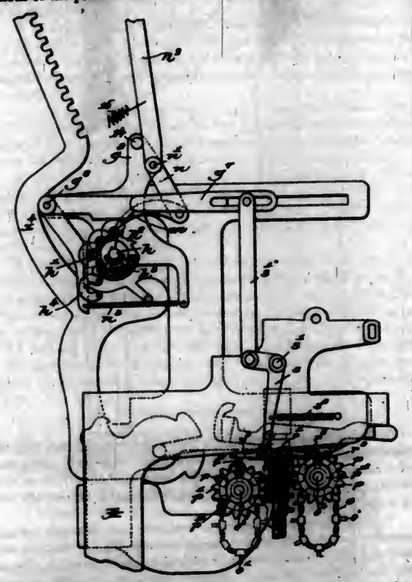
7. The herein-described head and neck protector, comprising a fixed and a separable shoulder-yoke, a side piece conforming approximately to the outline of the head, neck and shoulder secured at its lower end to the upper portion of the fixed shoulder-yoke, a corresponding side piece composed of complementary members pivotally connected at their upper ends and to the fixed side piece and having their lower ends connected with the extremities of the parts of the separable shoulder-yoke, fastening means applied to the parts comprising the separable side piece, upper and lower horizontally disposed curved rods connected midway of their ends to the fixed side piece and at their extremities to the complementary parts of the separable side piece, front and rear horizontal brace-bars connected with corresponding lower terminals of the shoulder-yokes, means for connecting the extremities of the shoulder-yokes, and front and rear brace-bars, and a meshed covering secured to the shoulder-yokes, front and rear brace-bars and to the said side pieces and extending over the curved rods and held distended thereby, substantially as set forth.

608,807. MACHINE FOR HARVESTING CORN. CHARLES H. WITHERSEE, Schaumburg, Ill., assignor to the McCormick Harvesting Machine Company. Filed Apr. 26, 1897. Serial No. 634,194. (No model.)

Claim.—1. In combination in a harvesting-machine with a binder in which the gavel is received and formed into a bundle, a gate positioned across the passage-way of the outgoing bundle to support the heads of the grain, which gate is pivoted with two bars that are independently pivoted to the machine.

2. In combination in a self-binding harvester with a binder in which the gavel is accumulated, a gate to support the heads of the grain, which gate consists of an arm positioned in the path of the heads and pivoted to parallel bars that are independently pivoted to the machine, and means for actuating the gate whereby it is rapidly withdrawn from and projected across the grain passage-way.

3. In combination with a self-binding harvester a gate to support the heads of the grain while the gavel is being formed, consisting of an arm that is pivoted to parallel bars, which are in turn pivoted to the machine, an arm rigidly attached to one of these bars and extending when the gate is across the passage-way in proximity to the extended knotter-shaft, a crank on the knotter shaft and a link connecting the crank on the knotter-shaft with the fixed arm of the gate, substantially as and for the purpose specified.



608,808. SHEDDING MECHANISM FOR LOOMS. ROLAND WYMAN and WILLIAM H. REBBINS, Worcester, Mass., assignors to the Crompton & Knowles Loom Works, same place. Filed May 13, 1896. Serial No. 591,378. (No model.)

Claim.—1. In a loom, a plurality of pattern-surfaces arranged respectively in fixed position and provided respectively with suitably-arranged projections, means to operate said pattern-surfaces singly, selecting-surfaces arranged to cooperate with the respective pattern-surfaces, and means to successively stop said pattern-surfaces each in position with its selecting-surface opposite the space between two projections of the pattern-surface, substantially as described.

2. In a loom, a plurality of pattern-surfaces provided respectively with suitably-arranged projections; means to continuously operate said pattern-surfaces singly, selecting-surfaces arranged to cooperate with the respective pattern-surfaces, and means to successively stop said pattern-surfaces each in position with its selecting-surface opposite the space between two projections of the pattern-surface, substantially as described.

3. In a loom, a plurality of pattern-surfaces provided respectively with suitably-arranged projections; means to operate said pattern-surfaces singly; rigidly-connected selecting-surfaces arranged to cooperate with the respective pattern-surfaces, and means to successively stop said pattern-surfaces each in position with its selecting-surface opposite the space between two projections of the pattern-surface, substantially as described.

4. In a loom, a plurality of pattern-surfaces provided respectively with suitably-arranged projections, means to operate said pattern-surfaces singly, selecting-surfaces arranged to move the same selecting-finger, arranged to cooperate with the respective pattern-surfaces, and means to successively stop said pattern-surfaces each in position with its selecting-surface opposite the space between two projections of the pattern-surface, substantially as described.

5. In a loom, a plurality of pattern-surfaces arranged in fixed position, drivers for the respective pattern-surfaces; means to successively connect said pattern-surfaces with and to be moved by their respective drivers, and the selecting-surfaces cooperating with said pattern-surfaces, substantially as described.

6. In a loom, a plurality of pattern-surfaces mounted to travel about fixed axes; selecting-surfaces; drivers mounted to rotate about axes coincident with said fixed axes, means to rotate said drivers, and clutch devices to successively connect said pattern-surfaces with their respective drivers, substantially as described.

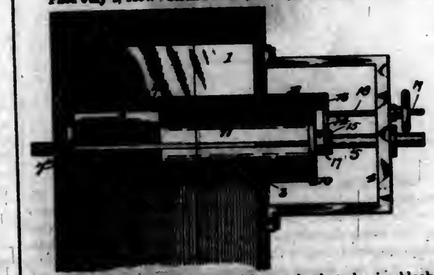
7. In a loom, a plurality of pattern-surfaces mounted in fixed position; continuously-rotating worm-wheel drivers therefor, means to successively connect said pattern-surfaces with and to be moved by said drivers, and the selecting-surfaces, substantially as described.

8. In a loom, a plurality of pattern-surfaces mounted to travel about fixed axes, selecting-surfaces, drivers mounted to rotate about axes coincident with said fixed axes, a single worm arranged to rotate said drivers, and means to successively connect said pattern-surfaces with and to be moved by said drivers, substantially as described.

9. In a loom, a plurality of pattern-surfaces mounted upon shafts journaled in fixed bearings; worm-wheel drivers also mounted on said shafts but rotatable independently of said pattern-surfaces; clutch devices adapted to connect said drivers with their respective pattern-surfaces, sliding collars on said shafts adapted to engage and operate said clutch devices, and means to successively move said sliding collars, substantially as described.

10. In a loom, a plurality of pattern-surfaces, arranged in fixed position, means to successively move said pattern-surfaces, an auxiliary pattern-surface and means controlled thereby to govern the successive operations of said first-named pattern-surfaces, substantially as described.

11. In a loom, a plurality of pattern-surfaces, arranged in fixed position, rotary devices for the respective pattern-surfaces; clutch devices to connect said drivers with and to move their respective pattern-surfaces; and an auxiliary pattern-surface and clutch-actuating devices controlled thereby and governing the operation of said clutch devices, substantially as described.

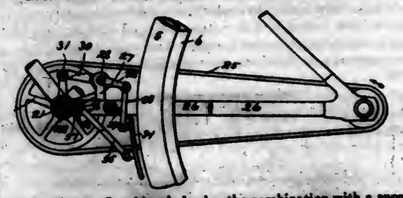


12. In a loom, the combination with a plurality of pattern-surfaces and means to operate the same, of selecting-surfaces for the respective pattern-surfaces, said selecting-surfaces being arranged substantially at right angles to each other, substantially as described.

13. In a loom, the combination with a plurality of pattern-surfaces and means to operate the same, of one or more selecting-fingers provided respectively with a plurality of arms each having a selecting-surface arranged to cooperate with a pattern-surface, substantially as described.

14. The combination in a loom-dobby, of two or more selecting-fingers, pattern-surfaces arranged in fixed positions in different levels, said pattern-surfaces cooperating with said selecting-fingers, and means to actuate said pattern-surfaces, substantially as described.

15. In a loom-dobby, a plurality of pattern-surfaces mounted in fixed bearings; selecting-surfaces, rotary drivers provided at their faces with projecting surfaces, clutch members connected with said pattern-surfaces and means to move the said clutch members into locking engagement with the projecting surfaces of their respective drivers, substantially as described.

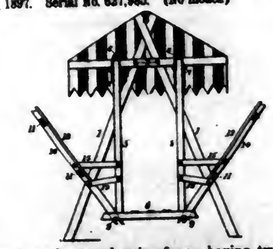


608,809. GRAIN-MEASURE. FRANK YEAGLEY, Lebanon, Pa. Filed July 1, 1897. Serial No. 643,060. (No model.)

Claim.—1. In combination with a grain-chute having blocks secured on opposite sides thereof, said blocks having concaved inner faces and slanting upper faces, a shaft journaled within the chute concentric with the concaved faces of said blocks, a measuring-receptacle having a number of compartments closed at one end and open at the opposite end, a face-plate splined on the shaft, said face-plate having an extension formed thereon, regulating-blocks on the face-plate slidably fitted in the compartments of the measuring-receptacle and forming the ends thereof, a cover having beveled sides to fit on the blocks in the chute, an arm secured at one end to the outer end of the cover and extending downward, said arm being notched to embrace the extension of the face-plate and fit in an annular groove formed therein, and an arm connected to said arm to draw the cover and blocks back and forth, as and for the purpose described.

2. A grain meter consisting of a chute, side blocks secured on the inner walls of the chute, said blocks having slanting tops and concaved faces, a rotary cylindrical measuring-receptacle journaled to be rotated between the blocks, movable blocks fitted in the compartments of the receptacle, and cover having beveled sides fitting on the slanting walls of the side blocks and connected to the movable blocks.

608,810. BACK-PEDALING BRAKE. APOLLO SWIROW, Hoboken, N. J. Filed June 30, 1897. Serial No. 643,060. (No model.)



Claim.—1. In a bicycle-brake, the combination with a sprocket-wheel adapted to be thrown out of action by back-pedaling, of standards supported by the frame of the wheel, a shaft mounted in said standards, a hinged pawl connected with said shaft, a roller-bearing on said sprocket-wheel, a brake-shoe and connections between said brake-shoe and said shaft, whereby when said wheel is revolved backwardly, said roller-bearing in conjunction with said pawl will apply said brake-shoe to the tire of the wheel, substantially as described.

2. The combination with the hub or axle of the drive-wheel of a bicycle or similar vehicle, of a sprocket-wheel which is adapted to be thrown out of action by back-pedaling, and a brake device which is connected with the frame of the vehicle adjacent to the support of

the pedal-shaft, said brake device being adapted to operate in connection with the tire of the drive-wheel when the pedal-shaft is turned backwardly, and consisting of a roller mounted on, or connected with the sprocket-wheel on the pedal-shaft, a suitably-supported shaft which is provided at one end with a hinged pawl which is adapted to be operated by said roller, and centrally thereof, with a backwardly-directed arm which is pivotally connected with a rod which is pivotally connected with the brake-shoe, said brake-shoe being also pivotally connected with a rod which is pivotally connected with the frame of the vehicle adjacent to the support of the pedal-shaft, substantially as shown and described.

608,811. SWING. SAMUEL ANDREWS, Wadsworth, Ohio. Filed Mar. 17, 1897. Serial No. 627,985. (No model.)

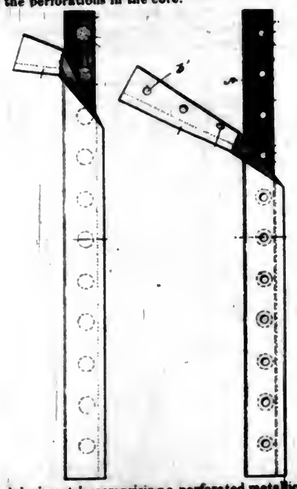
Claim.—1. An improved swing-frame, having two pairs of uprights and a cross-bar each pair of uprights pivotally connected near one end to the cross-bar, each pair of uprights adapted to have their outer ends swing outward to cross their shorter ends, and a detachable bar adapted to rest in the fork of the shorter ends, and having notches to fit and engage said uprights substantially as shown and for the purpose specified.

2. The combination with a supporting-frame having two pairs of uprights and two cross-bars; each pair of uprights pivotally connected near one end to one of said cross-bars, and adapted to have their ends swing outward and to cross above said cross-bars, and a detachable bar adapted to rest in said uprights above their point of crossing, and two pairs of oppositely-disposed pendants; each pair of pendants connected by a cross-rod adapted to rest on said cross-bars, substantially as shown and described.

3. The combination with two pairs of uprights, and two cross-bars, each pair of uprights pivotally connected near one end to one of said cross-bars, and adapted to have their loose ends swing outward, and a detachable bar adapted to rest in said uprights above the point of crossing, and two pairs of oppositely-disposed pendants, each pair of pendants connected by a cross-rod adapted to rest on said cross-bars; of a floor detachably connected with said pendants, and backs detachably connected with said floor, and seats and arms pivotally connected with said backs and pendants, substantially as shown and described.

4. An improved swing-frame having two pairs of uprights each pair crossed near one end, a cross-bar to rest in said pairs above their points of intersection and horizontal bars pivotally attached to said uprights below their points of intersection to form with said cross-bar a support for a canopy-top substantially as shown and described.

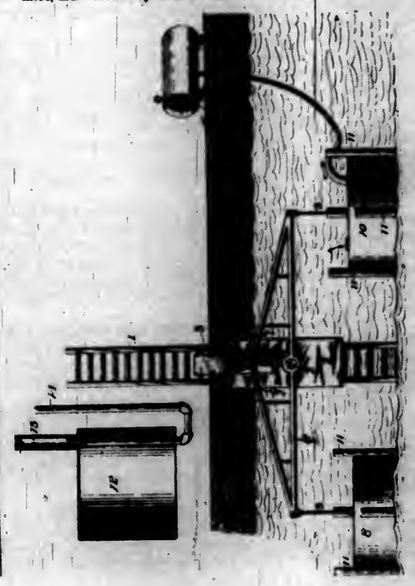
5. In a swing-frame, the combination with the crossed uprights, the cross-beam resting in their crossed ends, and the horizontal bars pivotally connected with said uprights, and a canopy-top to rest on said cross-beam and horizontal bars substantially as shown and described.



608,812. SHOW-CASE. FENIMORE C. BATA, Cleveland, Ohio. Filed May 20, 1897. Serial No. 637,478. (No model.)

Claim.—In a show-case the combination with the glass plates forming the top and front, of channeled protection binding-strip D, having lugs F, dowels *d*, and bolts *b'*, substantially as described.

608,818. LACING-STRIP. MOSES E. BORTREE and MARY H. BORTREE, Grand Rapids, Mich., assignors, by mesne assignments, to Enoch C. Bowling, Detroit, Mich. Filed Aug. 9, 1897. Serial No. 647,589. (No model.)



Claim.—1. A lacing-strip comprising a perforated core having fillings in its perforations, and a covering for said core intimately associated therewith and preventing the dislodgment of the filling material from the perforations in the core.

2. A lacing-strip comprising a perforated metallic core, non-corrosive fillings in the perforations thereof and themselves perforated, and a covering for the core intimately associated therewith so as to prevent dislodgment of the fillings and perforated to correspond with the perforations in the fillings.

3. A lacing strip comprising a composite core of metal and non-corrosive material, the latter covering metallic edges of the core with which the lacing would contact at various points throughout substantially the length of the strip; together with a textile covering closely applied over the composite core and having a free attaching-flap projecting from one longitudinal edge of the latter; said strip having openings at intervals extending through the textile covering and the non-corrosive material of the core, substantially as described.

608,814. TIDE AND WAVE MOTOR. AARON A. BROWN, Baltimore, Md. Filed July 8, 1897. Serial No. 643,841. (No model.)

Claim.—1. In a device of the character described, a walking-beam suitably pivoted, a float attached to one end thereof and a compressor-chamber attached to the other end, as and for the purpose described.

2. In a device of the character described, a walking-beam suitably pivoted, a float attached to one end thereof and an air-compressor having an open bottom attached to the other end, as and for the purpose described.

3. In a device of the character described, a walking-beam suitably pivoted, a float attached to one end thereof, a compressor attached to the other end and means for automatically raising and lowering the pivotal point of the walking-beam, as and for the purpose described.

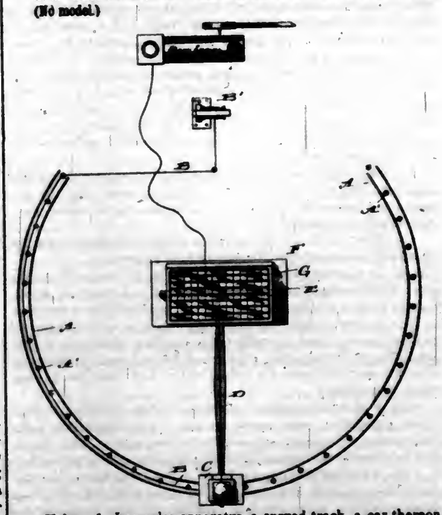
4. In a device of the character described, a standard, a sleeve slidable thereon, a walking-beam carried by the sleeve, spring-pressed levers pivoted on the sleeve and adapted to engage the standard and means for operating the levers, as and for the purpose described.

5. In a device of the character described, a standard, a sleeve slidable thereon, spring-pressed levers pivoted to the sleeve and adapted to engage the standard, a walking-beam pivoted to the sleeve and cam-plates on the walking-beam to operate the levers, as and for the purpose described.

6. In a device of the character described, a standard having a number of rounds, a sleeve slidable thereon, spring-pressed levers pivoted to the sleeves, tapering noses on the levers to engage the rounds of the standard, a walking-beam pivoted to the sleeve cam-plates on the walking-beam to operate the levers, a float attached to one end of the walking-beam, a compression-tank attached to the other end of the walking-beam having an open bottom and an air inlet and outlet and guides for the float and tank, as and for the purpose described.

608,815. WHIFFLETREE ATTACHMENT. PETER BURGLAND, Dodge City, Kans., assignor of one-half to Fred R. Bowman, same place. Filed Sept. 28, 1897. Serial No. 653,333. (No model.)

Claim.—In a device of the class described, the combination of a whiffletree provided at its end with an inwardly-extending longitudinal bore, a trace-receiving loop mounted on the end of the whiffletree and provided with perforations registering with the bore, a casing mounted upon the whiffletree and provided at its outer end with a removable cap and having its inner end open, a rod having its outer end extended through the loop and fitting in the bore of the whiffletree, the body portion of the rod extending through the casing and passing through a perforation of the cap and having its inner end threaded, the stop 12 mounted on the body portion of the rod and arranged within the casing at the inner end thereof, a coiled spring housed within the casing and interposed between the removable cap and the stop 12, and the detachable head 14 threaded to engage the inner end of the rod, and provided with a substantially straight edge arranged contiguous to the top of the whiffletree, and adapted to slide longitudinally thereof, said head being prevented from accidentally unscrewing by the whiffletree, substantially as described.



608,816. PAPER-HOLDING DEVICE. JAMES W. BUSH, Scioto-ville, Ohio. Filed Oct. 21, 1897. Serial No. 655,987. (No model.)

Claim.—1. The herein-described device for holding and permitting of the convenient use of alcohol and tissue-paper comprising a casing having a slot in its side wall, a lip at one side of said slot having its free edge sharpened, and a spring-pressed clamp at the opposite side of the slot impinging against the lip and serving to close the slot, a rotary spool arranged in the casing and having a central opening, and a suitably-supported receptacle for alcohol arranged in the central opening of the spool, substantially as specified.

2. In a device for the purpose described, the combination of the casing comprising the annular vertical wall having a slot and also having a lip at one side of the slot and a spring-pressed clamp at the opposite side adapted to impinge against the lip and close the slot, the bottom wall detachably connected to the annular wall and having antifriction-rollers on its upper side and also having a central pivot-post, and a top wall connected to the upper edge of the annular wall and having a central opening, a disk mounted on the pivot-post of the bottom wall, a spool supported by said disk and having a central opening, a frame resting in the opening of the spool and having a flange at its upper end bearing on the top wall of the casing and also having an inwardly-directed flange at its lower end, a receptacle for alcohol arranged in the frame and resting on the lower flange thereof and having a stopper provided with a brush of fibrous material, and a cap-plate bearing on the top wall of the case and the upper end of the receptacle and having a central opening for the passage of the receptacle-stopper, substantially as specified.

608,817. SOLAR APPARATUS. WILLIAM CALVER, Washington, D. C. Filed Oct. 23, 1896. Renewed Oct. 9, 1897. Serial No. 654,705. (No model.)

Claim.—1. In a solar apparatus, a curved track, a car thereon, a reflector within the space bounded by the track, and an object mounted upon the car to travel across the same and to receive the rays from the reflector, substantially as specified.

2. A reflector, a curved track, a car, and means positively connecting the car with the reflector for changing the position of the support of the reflector with relation to the car, substantially as specified.

3. A reflector, a curved track, a car, means positively connecting the reflector and the car, and mechanism for adjusting the relative position of the support of the reflector and the car by the movement of the car, substantially as specified.

4. A reflector, a curved track, a car, a truck mounted to travel across the car and means for adjusting the position of the truck, substantially as specified.

5. A curved track, a car, a rotatable reflector-supporting frame positively connected with the car, a reflector mounted in said frame, a gearing interposed between the reflector and a relatively-fixed part for receiving movement by the movement of the car upon the track, substantially as specified.

6. A curved track, a car, a reflector-supporting frame pivotally mounted, a positive connection of the car with the said frame so as to move the same upon or about its pivot, a fixed gear, an interposed gearing between the reflector and fixed gear for moving the reflector with relation to the movement of the car, substantially as specified.

7. A series of individual reflectors mounted in a common frame which is in turn pivotally mounted and devices for simultaneously adjusting said individual reflectors, substantially as specified.

8. A reflector composed of individual reflecting-surfaces mounted in a movable frame and each connected to a common adjusting device, and means for operating said device, substantially as specified.

9. A reflector composed of individual reflecting devices connected to a common adjusting device, means for regulating the latter, and a friction device for retaining said means in an adjusted position, substantially as specified.

10. A reflector composed of individual reflectors each connected with a common adjusting device, a rotary supporting-frame for said reflector, a fixed support for said frame, and gearing interposed between said fixed support and the common adjusting device for regulating the position of the individual reflectors, substantially as specified.

11. A rotatable reflector-supporting frame and a reflector mounted thereon, a fixed gear, rotatable gearing mounted on the frame, and a connection between the same and the reflector, substantially as specified.

12. A rotatable reflector-carrying frame, a fixed gear, rotatable gearing mounted on the frame and having means for disconnecting the gearing, substantially as specified.

13. A rotatable reflector-frame, a fixed gear, a rotatable gearing mounted on a crank-shaft carried by the frame, and means for disconnecting the crank-shaft from the gearing mounted thereon, substantially as specified.

14. A rotatable reflector-carrying frame, a reflector mounted therein composed of individual reflecting-surfaces with each connected with a common adjusting device, a disk connected with said device, and a rod connecting said disk with a crank-shaft, a rotatable reflector-frame carrying said crank, and gearing adapted to receive motion through the rotation of said frame, substantially as specified.

15. A rotatable reflector-frame, gearing receiving motion from the movement of said frame, a connecting-rod extending from said gearing to a disk provided with means for attaching said rod at different points on said disk, and an adjusting device operatively connected with said disk and with a series of individual reflectors, substantially as specified.

16. In a solar apparatus, a track-support consisting of a post for supporting the rail, an apertured bed-plate through which the post passes, and means for adjustably securing the post in the bed-plate, substantially as specified

17. The combination of the rail *a*, post A^9, bed-plate A^8 and the adjustable securing device A^4, substantially as specified.

18. In a solar apparatus, the car C having the tracks H^7 and the truck H^5 H^6 mounted to travel across the car and means for adjusting the position of the truck upon the car, substantially as specified.

19. In a solar apparatus, a curved track, a car, a truck mounted to travel across the car, a cable and a windlass, suitable cable-guiding pulleys, a car-propelling weight, and a time-measuring device operatively connected with the weight and with the windlass, substantially as specified.

20. In a solar apparatus, a reflector, a car, a curved track, a truck mounted to move across the car, a steam-producing boiler mounted upon the truck, steam-operated mechanism, and a connection between the boiler and said mechanism, substantially as specified.

21. In a solar apparatus, a reflector, a curved track, a car mounted to traverse the same and positively connected with the reflector, a steam-producing boiler mounted upon the car, and steam-operated mechanism flexibly connected with the boiler, substantially as specified

22. In a solar apparatus, a reflector, a car movable about the reflector, an elevated platform mounted on a truck constructed to travel across the car, and an object to be heated mounted on the platform, substantially as specified.

23. In a solar apparatus, a reflector, a car movable about the reflector, and an object to be heated by the reflector carried by and elevated above the car, substantially as specified.

24. In a solar apparatus, a car having an elevated platform and means for reaching the same and for exposing the object to rays from the reflector upon or above the platform, substantially as specified.

25. The combination with the car, of the truck H^5 H^6 the threaded shaft H° and nut H°, substantially as shown and described.

26. The combination of the car C, the truck H^3, the boiler H, the supply-pipe H′ and the delivery-pipe H^{11}, substantially as specified.

27. The combination with the reflector-frame E′ and its pivot E, of the base F, the gears J I^2 and crank-shaft I, the connecting-rod K and the frame G, substantially as shown and described.

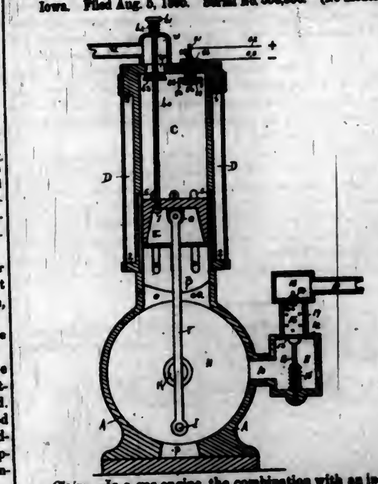
28. The combination with the frame E E′ car C track A and connecting-rod D, of the frame G connecting-rod K and gearing I I^2 and J, substantially as specified.

29. The combination of the frame G carrying the reflectors L, the rods M M^2, spring M^3, disk M^4, connecting-rod K, and gearing I I^2 and J, substantially as specified.

30. The combination of the frame G, individual bars L having journals L′, the plate G^2 having aperture G^3 and slot G^4, and means for securing the plate adjustably to the frame G, substantially as specified.

31. A reflector consisting of a base, a reflecting-surface, bars for supporting the same movably mounted on the base, and means for adjustably connecting the bars with the base, substantially as specified.

32. A reflector consisting of the base L^2, grooved bars N, and devices as N′ for adjustably connecting the grooved bars with the base, substantially as specified



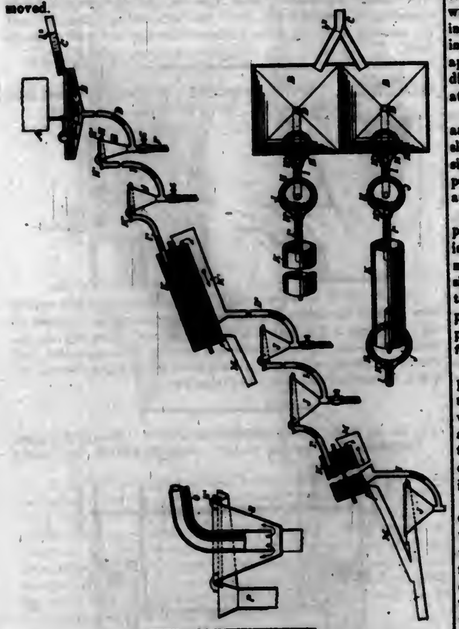
33. In a solar apparatus, a gear having removable devices constituting the cogs thereof, substantially as specified.

34. In a solar apparatus, a gear having removable and adjustable devices constituting the cogs thereof, substantially as specified.

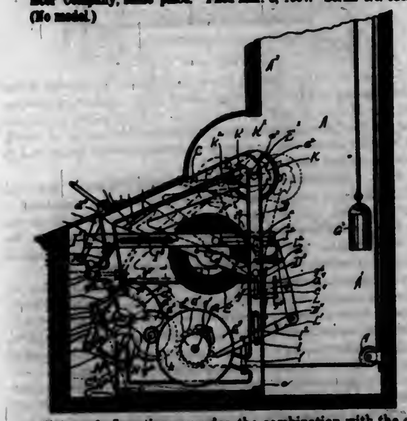
35. In a solar apparatus, a gear provided with cogs adjustable to follow the irregular motion of the sun, substantially as specified.

36. In a solar apparatus, the combination with a reflector, a curved track, a car, and means positively connecting the car with the reflector, of a crank-shaft and its connecting-rod having means for adjustment to suit the different seasons of the year, substantially as specified.

608,818. OIL-GAS MOTOR. HOWARD K CLOVER, Council Bluffs, Iowa. Filed Aug. 5, 1896. Serial No. 552,260. (No model.)



Claim.—In a gas-engine, the combination with an incasing shell, comprising the lower housing, *a*, the upper cylindrical section, C, and the intermediate section, B, said intermediate section being provided with the grooves, 5, 5, of the valved supply-chamber, 11, communicating with said chamber, *a*, the valve-seating, 30, within said upper cylinder, the housing, 31, covering said valve-seating, the escape-pipe, 32, extending from said housing, the rod, 40 working through said housing, 31, the valve, 34, secured to said rod and working into said seating 30, the spring, 42, to force said rod, 40, normally into an upward direction, the supporting-shaft, K, the disks, H, secured to said shaft, the crank-pin, I, securing said disks, H, H, the pitman, F, secured to said crank-pin, I, and the piston, E, said piston, E, being of a length less than the length of said grooves, 5, and reciprocating within said intermediate portion, B, and cylinder, C, said rod, 40, working loosely through said piston, E, in one direction and actuating said rod, 40, in an opposite direction said piston being secured to and actuated by said pitman-rod, F, in combination with a suitable igniter secured within said chamber, C, as and for the purpose set forth.



608,819. SEPARATOR AND CONCENTRATOR. CHARLES B. CROWELL, Stella, and MERRITT F. GALE, San Francisco, Cal.; said Gale assignor to said Crowell. Filed June 4, 1897. Serial No. 639,496. (No model.)

Claim.—An improved apparatus for separating and concentrating heavy valuable materials from lighter slimes, consisting of one or more series of hoppers situated one below the other so that the discharge from the uppermost will be delivered successively into the bottom of the next succeeding hopper, said hoppers being of gradually-increasing diameter and having upwardly-diverging sides, inclined overflow-directing lips surrounding the upper parts of the hoppers, annular troughs surrounding the hoppers into which the overflow-discharge is received and pipes connecting said troughs successively with the bottoms of the next succeeding hoppers whereby an upward flow at a gradually-decreasing rate takes place in each of the hoppers, inclined cylindrical rotary screens journaled intermediate between one or more of each series of hoppers adapted to receive the overflow from the next preceding hopper and deliver it into the following one, casings in which the screens rotate, having pipes leading therefrom to the next succeeding hopper, final discharge sluices, and preliminary water and pulp receivers with means for automatically, regulating the water-supply, a pipe extending to said

receiver with diverging branches leading to the two series of hoppers, and a gate at the junction of the branches whereby the supply is diverted alternately from one to the other series whenever the material collected in the discharge-pipe of the hoppers is to be removed.

608,820. TIME-RECORDER. JOHN W. DRUMMER, Chicago, Ill., assignor, by direct and mesne assignments, to the Chicago Time Register Company, same place. Filed Mar. 3, 1897. Serial No. 626,429. (No model.)

Claim.—1. In a time-recorder, the combination with the casing and the clock-controlled printing mechanism and recording-sheet therein, of means operable from without the casing for taking an impression from the printing mechanism, means enabling the individual effecting the impression to attach his identification-mark thereto, and a sight-opening through which the said impression may be viewed, whereby the individual is enabled to inspect for identification the record to which he attaches his identification-mark.

2. In a time-recorder, the combination of a casing, a clock-controlled printing mechanism, a normally stationary recording sheet or strip therein, and means for feeding the sheet step by step, means operable from without the casing for effecting the printing of a time-record, means enabling the individual making the time-record to mark the same for identification, and a sight-opening through which the time-record may be viewed, whereby the individual is enabled to inspect for identification the record to which he attaches his identification-mark.

3. In an autograph time-recorder, the combination of a casing clock-controlled time-printing mechanism, and a recording-sheet within the casing, means operable from without the casing for effecting the printing of a record on the recording-sheet, a slot in the casing through which the sheet is exposed for signature and a sight-aperture through which the record may be viewed, whereby the individual is enabled to inspect for verification the record to which he attaches his identification-mark.

4. In an autograph time-recorder, the combination with a casing and a recording mechanism and time-recording sheet therein, of a slot in the casing through which the recording-sheet is exposed for signature and a transparency adjacent to said slot through which the printed record to which the signature is affixed, may be viewed when affixing the signature thereto.

5. In an autograph time-recorder, the combination with a casing, provided with a slot and clock-controlled printing mechanism embracing printing-forms arranged within the casing, of a carriage pivotally mounted within the casing, a platen upon said carriage, a recording-sheet carried by the carriage and arranged to pass over the platen thereof and means for swinging the carriage about its pivotal support, said printing-forms being arranged directly in the path of the platen so that the latter is brought into printing contact with said forms by the swinging of the carriage.

6. In an autograph time-recorder, the combination of a casing provided with a slot and clock-controlled printing mechanism arranged within the casing, a movable platen-carrying carriage, mounted within the casing, a recording-sheet arranged to pass over the platen and adapted to be brought into position to receive a signature thereon through the slot and a sight-opening through which the printed record upon the recording-sheet may be inspected at the time of affixing the signature thereto.

7. In an autograph time-recorder, the combination of a casing clock-controlled printing mechanism and an oscillatory platen-carriage within the casing, a recording-sheet carried by said carriage, a slot within the casing through which the recording-sheet may be exposed for signature and means for oscillating the carriage to carry the recording-sheet into printing contact with the printing devices and to thereafter carry it into position to expose the recording-sheet through the slot.

8. In an autograph time-recorder, the combination of a casing clock-controlled printing mechanism, and an oscillatory platen-carriage within the casing, a recording-sheet carried by said carriage, a slot in the casing through which the recording-sheet may be exposed and means for oscillating the carriage to first carry the recording-sheet into printing contact with the printing devices and to thereafter return it to and beyond its normal position into position to expose the recording-sheet for signature to the slot.

9. In an autograph time-recorder, the combination of a casing, clock-controlled printing mechanism and an oscillatory platen-carriage within the casing, a recording-sheet carried by said carriage, a slot in the casing through which the sheet may be exposed and means for oscillating the carriage to first carry the recording-sheet into printing contact with the printing devices and to thereafter return it to and beyond its normal position into position to expose the recording-sheet for signature to the slot, said movement being effected by means of an oscillatory operating-bar arranged outside of the casing and suitable operative connections whereby both the forward and return movements of the carriage are caused by a single movement in one direction of said operating-bar.

10. In an autograph time-recorder, the combination of a casing, clock-controlled printing mechanism and an oscillatory platen-carriage within the casing, a recording-sheet carried by said carriage, a slot in the casing through which the sheet may be exposed means for oscillating the carriage to first carry the recording-sheet into printing contact with the printing devices and to thereafter return it to and beyond its normal position into position to expose the recording-sheet for signature to the slot, said movement being effected by means of an oscillatory operating-bar arranged outside of the casing and suitable operative connections whereby both the forward and return movements of the carriage are caused by a single movement in one direction of said operating-bar, and means operating to automatically return the carriage to a position rendering the recording-sheet inaccessible through the slot.

11. The combination in a time recorder having a casing provided with a slot through which the recording-sheet is adapted to be exposed and a printing mechanism and recording-sheet within the casing, of means for effecting the printing of a time-record and for bringing the sheet into position to receive a signature consisting of an operating-bar located outside the casing adjacent to the slot and arranged to normally stand in an upwardly-projecting position said operating-bar being adapted to accomplish the printing of a time-

record upon the recording-sheet and the bringing of the latter into position to receive a signature with the time-record exposed to view when depressed into or toward a horizontal position by resting the hand thereon when in writing position.

12. In an autograph time-recorder the combination of a casing provided in its upper side with a slot, an oscillatory carriage mounted within the casing adjacent to said slot, provided with a platen-bar and a impressing-bar and carrying receiving and supply rolls, a recording-sheet upon said rolls arranged to pass over the impressing bar and platen in its passage from the supply to the receiving roll, minute and hour type-wheels rotatably mounted in the path of the impressing-bar, mechanism for rotating said type-wheels to cause them to present printing characters representing the time of day at the printing-point, an inking device adapted to cooperate with the type-wheels and means operable from without the casing for oscillating the carriage to cause an impression upon the recording-sheet and to bring the latter into position to receive his signature thereon.

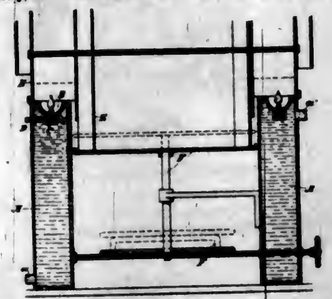
13. In an autograph time-recorder, the combination of a casing provided in its upper side with a slot, an oscillatory carriage mounted within the casing adjacent to said slot and consisting of two parallel triangular-shaped side or end frames rigidly secured together and pivotally mounted upon an axis extending longitudinally of the carriage adjacent to one of the outer angles of the same, a combined impressing bar and platen extending between said side frames at one of the other angles of the carriage having its impressing-surface arranged in a plane substantially radial to the pivotal axis of the carriage, receiving and supply rolls upon the carriage, a recording-sheet mounted upon said roll arranged to pass over the impressing and platen bar in its passage from the supply to the receiving roll, minute and hour type-wheels rotatably mounted in the path of the impressing bar, mechanism for actuating said type-wheels, an inking device adapted to cooperate with the type-wheels, and an operating-bar arranged outside the casing and provided with operative connections for oscillating the carriage to cause an impression upon the recording-sheet and to bring the platen into position to receive a signature upon the recording-sheet.

14. In an autograph time-recorder, the combination with a casing provided with a slot, through which the recording-sheet is adapted to be exposed, an oscillatory carriage provided with a platen and carrying supply and receiving rolls, a recording-sheet arranged to pass over said platen in its passage from the supply to the receiving rolls, mechanism for printing a time-record upon the sheet an automatic paper-feeding device adapted to feed the paper into position upon the platen to receive a signature thereon opposite the time-record as the platen is brought into register with the slot.

15. The combination in a time-recorder provided with printing-forms, of an inking device comprising an oscillatory arm carrying at its free end an inking-pad, a spring tending to hold said arm normally free from the type, a tappet-block mounted adjacent to the oscillatory arm and adapted to act upon the latter to depress the inking-pad into contact with the type and a radial arm upon the tappet-block arranged to project into the path of a reciprocatory part of the recorder mechanism, said reciprocatory part being adapted to oscillate the inking device into contact with the types and to thereafter permit it to spring back to its normal position.

16. In a time-recorder, the combination with a casing, provided with a slot and an oscillatory platen-carriage adapted to bring the recording-sheet into position to expose it through the slot, of means for actuating said carriage, comprising an oscillatory bar arranged outside the casing and provided with a rigid arm extending within the casing, a shift-bar pivotally connected with the arm at one end and having sliding support upon the machine-frame at its other end, a stud upon the shift-bar, an oscillatory lever pivoted between its ends upon the machine-frame and adapted to be engaged by the stud of the shift-bar, oscillated a limited distance thereby and released in the further movement of the bar, a stud upon the carriage-frame located in position to be engaged by the opposite end of the oscillatory lever to oscillate the carriage in one direction and a second stud upon the shift-bar adapted to directly engage the carriage-frame to oscillate it in an opposite direction, whereby the impressing movement and the returning of the platen-carriage into position to receive a signature upon the recording-sheet are effected by the movement in a single direction of the operating-bar.

17. In a time-recorder the combination with the recording mechanism, a motor for actuating the printing-forms, and an operating device arranged outside the casing for effecting the printing operation, of an automatic winding device, consisting of a ratchet-wheel arranged to act upon the winding-shaft of the motor, and a pawl arranged to act upon the ratchet-wheel and operatively connected with the printing mechanism whereby the ratchet-wheel will be operated each time an impression is taken from the printing-forms.



18. In a time-recorder, the combination with the recording mechanism, a motor for actuating the printing-forms, and an operating device arranged outside the casing for effecting the printing operation, of an automatic winding device, consisting of a ratchet-wheel arranged to act upon the winding-shaft of the motor, and a pawl arranged to act upon the ratchet-wheel and operatively connected with the printing mechanism whereby the ratchet-wheel will be operated each time an impression is taken from the printing-forms, and means operating to automatically throw the self-winding mechanism out of operation when the motor has been wound up to a predetermined limit.

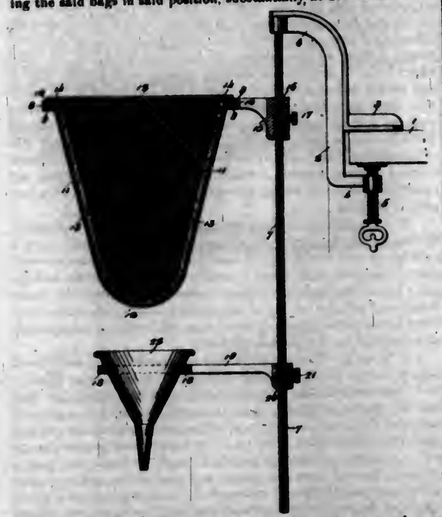
603,821. WATERING-TROUGH. WILLIAM DEY, Golden Gate, Minn. Filed June 24, 1897. Serial No. 642,170. (No model.)

Claim.—In a watering-trough, the combination of the water-inlet, a valve for controlling the same, a cog or pinion provided on the valve-stem, a flap hinged to the trough and extending into the same, a rack-bar connected with said flap and in engagement with the cog or pinion, and a spring for returning the flap to normal position, substantially as shown and described.

603,822. SELF-FEEDING OIL-STOVE. EDWARD H. DRIGGS, Berkeley, Cal. Filed Aug. 23, 1897. Serial No. 649,176. (No model.)

Claim.—1. In an oil-stove, the combination of an annular jacket or shell having within it a cooling medium, an annular oil-chamber at or near the top of said annular jacket and extending within the same and into the cooling medium, a wick therein, and an oil supply pipe for said oil-chamber passing through said annular jacket and its contained cooling medium.

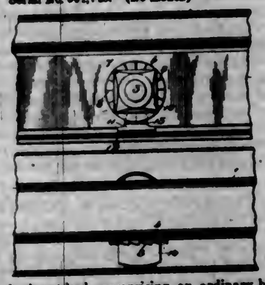
2. In a lamp-stove, the combination of an annular jacket or shell containing a cooling medium having its top wall depressed to form an annular wick-chamber extending into said annular jacket and into the contained cooling medium and a fuel-supply pipe for said wick-chamber through said annular jacket and its contained cooling medium.



3. In a lamp-stove, the combination of an annular jacket or shell, containing a cooling medium, having its top wall annularly depressed to form an annular wick-chamber B an annular oil-groove in the bottom thereof both extending into said annular jacket and its contained cooling medium, a wick in said wick-chamber, and a fuel-supply for said wick-chamber, substantially as described.

4. In a lamp-stove, the combination of a water-jacket, a narrow shallow wick-chamber extending into said jacket, and a wick in said wick-chamber substantially filling said chamber, a fuel-supply connected with said wick-chamber, an automatic regulator for said supply, and adjusting means for said regulator.

5. In an oil-stove, the combination of a water-jacket a shallow oil-chamber for supplying the wick or burner extending into said water-jacket, a supply-reservoir for the oil-chamber, a float-chamber connected by said supply-pipe to said reservoir and oil-chamber, a float in said float-chamber, a regulator-valve in said supply-pipe, and an exposed adjustable connection between said float and valve, substantially as described.



603,823. FILTER. JOHN H. BOKART, Joplin, Mo. Filed Oct. 21, 1897. Serial No. 655,945. (No model.)

Claim.—1. A filter comprising a suitable felt bag, a wire-gauze bag located within the same, leaving a space, and means for supporting the said bags in said position, substantially as described.

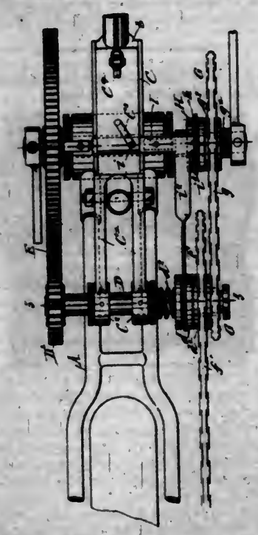
2. A filter comprising a clamp having a curved upper end, a rod depending therefrom, a support adjustably secured to said rod, an inner annular shoulder formed on said support, a felt bag supported on said shoulder, an inner wire-gauze bag located within the felt bag forming a space between said bags, an annular band secured to the upper edge of the wire-gauze bag, and resting on the upper edge of the felt bag, a second support also adjustably secured to the depending rod, a ring forming a part of said support, and a funnel carried by said ring substantially as described.

603,824. NUT-LOCK. JOHN H. BOKART, Joplin, Mo. Filed Dec. 13, 1897. Serial No. 661,745. (No model.)

Claim.—1. A nut-lock, comprising an ordinary bolt, a circular washer having a rear smooth surface, ratchet-teeth formed on the opposite surface of the same, a foot portion formed integral with said washer, a groove formed between the washer and foot portion, whereby the metal is reduced, and a nut having a ratchet formed on its engaging surface, and adapted to cooperate with the ratchet-teeth formed on the washer, substantially as described.

2. A nut-lock, comprising an ordinary rail and fish-plate, a bolt passing through the same, a circular washer having a central opening for receiving the bolt, radially-arranged ratchet-teeth formed on the outer surface of said washer, a foot portion formed integral with the washer and having a straight lower surface which comes in contact with the base of the rail, a groove formed in the metal between the washer and foot whereby the metal is reduced, and a nut having radially-arranged ratchet-teeth formed on one of its faces which cooperate with the ratchet-teeth formed on the washer, substantially as described.

603,825. RACK-PEDALING BRAKE. SILAS FADER, Vancouver, Canada, assignor of one-half to Adolphus Williams and John T. Carroll, same place. Filed Oct. 13, 1897. Serial No. 655,045. (No model.)



Claim.—1. In a bicycle brake mechanism, the combination with the drive-axle hub, having a clutch-face, a friction-disk detachably secured thereon and rotatable therewith, a sprocket-wheel having a clutch-face at one side and a friction-face at the other and loosely mounted on the hub, of a non-rotatable disk member interposed between the sprocket-wheel friction-disk and the hub friction-disk and adapted to be engaged on opposite sides by the said fixed disk and sprocket-disk when the movement of the sprocket-wheel is retarded, substantially as shown and for the purposes described.

2. In a bicycle brake mechanism, the combination with the drive-axle and the hub, said hub having a clutch-face, and a disk rotatable therewith but held from lateral movement, of a sprocket-wheel having a clutch-face and a friction-face, a friction member held between the sprocket-wheel and the rotatable friction-disk adapted to be engaged on its opposite sides by the said rotatable friction-disk and the sprocket-wheel friction-face, as the movement of such wheel is checked, as specified.

3. In a bicycle-brake of the class described, the combination with the drive-axle, the hub having wedge clutch members and a portion having left threads, the disk 8 fitted on such threaded portion, the laterally-movable sprocket having wedge clutches at one side and a fixed friction-disk 7 at the other, the disk 6, having a limited lateral movement on the hub and held between the disks 7 and 8, said disk 6, having a spring-hanger 11 connected with the machine-frame, and a stop 9 to engage a fixed portion of the machine, said disk having recesses on opposite sides, and the packing-rings held in the pockets of the disks 6, all being arranged substantially as shown and described.

603,826. ATTACHMENT FOR BICYCLES. LOUIS FRISCOLD, New York, N. Y. Filed Oct. 28, 1897. Serial No. 656,721. (No model.)

Claim.—1. The combination with a bicycle, of an attachment consisting of a driving sprocket-wheel loosely mounted upon the pedal-shaft and adapted to be thrown into fixed engagement therewith, a gear-wheel upon said pedal-shaft, a bed-plate provided with bearings, a shaft journaled in said bearings, a pinion fixed upon said shaft meshing with said gear-wheel, a large and small sprocket-wheel fixed upon a hub loosely sleeved upon said shaft, a sprocket-chain connecting the driving sprocket-wheel with the said small sprocket-wheel, a sprocket-chain connecting the said large sprocket-wheel with the rear wheel of the bicycle, and means substantially as described whereby the driving-sprocket may be thrown into or out of fixed engagement with the pedal-shaft and whereby the large and small sprocket-wheels may be thrown into or out of fixed engagement with said shaft, substantially as set forth.

2. The combination with a bicycle of an attachment consisting of a shaft geared to the pedal-shaft of the bicycle, a hub loosely sleeved upon said shaft and forming one member of a clutch mechanism, a large and small sprocket-wheel carried by said hub, a movable clutch member splined to said shaft and adapted to be thrown into and out of engagement with the clutch member carrying the sprocket-wheels, a driving sprocket-wheel loosely sleeved upon the pedal-shaft and adapted to be thrown into fixed engagement therewith, a sprocket-chain connecting the driving-sprocket with the said small sprocket-wheel, a sprocket-chain connecting the said large sprocket-wheel with the rear wheel, a hub splined to the pedal-shaft, means for operating said hub and said clutch mechanism, and a spring sleeved upon said pedal-shaft, whereby the said driving sprocket-wheel is thrown into engagement with the pedal-shaft, substantially as set forth.

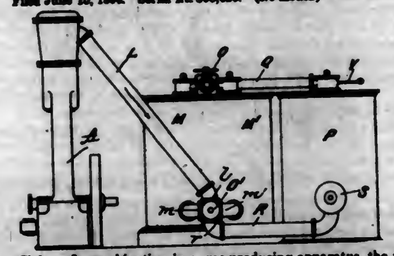
3. The combination with a bicycle, of an attachment consisting of a bed-plate adapted to be secured to the frame of the bicycle and provided with forked arms having bearings at the extremities thereof, a shaft journaled in said bearings, a pinion fixed upon one end of said shaft, a clutch member loosely sleeved upon said shaft, a large and a small sprocket-wheel carried by said clutch member, a movable clutch member splined upon said shaft and adapted to be thrown into and out of engagement with the other clutch member, a gear fixed upon the pedal-shaft and meshing with the said pinion, a driving sprocket-wheel loosely mounted upon said pedal-shaft and provided with a grooved hub, a hub splined upon the pedal-shaft adapted to bear against one face of the hub of said driving sprocket-wheel, a spring coiled upon the said pedal-shaft and bearing against the other face of said hub whereby said driving sprocket-wheel is adapted to be thrown into engagement with the splines upon the pedal-shaft, a slide-bar carried by the said bed-plate and provided with an inclined slot, a clutch-bar provided with a pin adapted to engage the inclined slot of the slide-bar, a downwardly extending arm adapted to engage the hub splined upon the pedal-shaft, an arm carried by said slide-bar and extending parallel therewith, and adapted to engage the movable member of the said clutch mechanism, a sprocket-chain connecting said driving sprocket-wheel with the said small sprocket-wheel, and a sprocket-chain connecting the said large sprocket-wheel with the rear wheel of the bicycle, and an operating-lever pivoted to the frame of the bicycle and to the said slide-bar, substantially as set forth.

608,827. OIL-FILTER. AUGUST H. FRANKE, St. Louis, Mo. Filed Oct. 11, 1897. Serial No. 654,859. (No model.)

Claim.—1. In an oil-filter, an outer wall, a bottom attached to said outer wall, an inclosing or jacketing wall surrounding and attached to the outer side of said outer wall forming an inclosed air-chamber or air-jacket around the outer side of the said outer wall, one or more openings near the upper and one or more openings near the lower edge of, and in the said inclosing or jacketing wall and communicating with the upper and lower parts of the said inclosed air-chamber, an incasing wall of less width than the said inclosing or jacketing wall, surrounding and attached to the outer side of, and between the said upper and lower openings in the said inclosing or jacketing wall to form a steam-chamber around the outer side of said inclosing or jacketing wall, a steam-inlet fitting, an outlet-check and a relief-valve attached to said incasing wall and in suitable communication with the said steam-chamber, all for the purpose to adjustably reduce the intensity of the heat communicated to the oil within the said outer wall by the steam heat within the said steam-chamber, substantially as shown and for the purpose set forth and specified.

2. In an oil-filter, an upper tank resting on a lower tank or reservoir, said upper tank having an upward-flared bottom, an outer wall, attached to the said bottom, an inner wall having openings near its upper edge, a strainer resting on the upper edge of said inner wall, a deflecting-shield attached to said strainer and suspended in the chamber formed between said outer wall and said inner wall, said outer wall to have formed in and around it one swage near its lower edge and one swage near its upper edge for the purpose to strengthen these parts of said outer wall and for the purpose to form shoulders, an inclosing wall its upper edge and also lower edge are turned inwardly and form connecting-walls attached to and surrounding the outer side of the said outer wall and between the said upper and lower swage forming an air-chamber; to have one bead near the upper edge of, and in and around the said inclosing wall and one bead in and around and near the lower edge of the said inclosing wall, suitable openings above the said upper bead and in the said inclosing wall and suitable openings below the said lower bead and in the said inclosing wall, a casing attached to and surrounding the outer side of the said inclosing wall and between the said upper and lower beads, forming a steam-chamber, a steam-inlet opening, outlet-opening and relief-opening in said casing, substantially as shown and for the purpose as set forth.

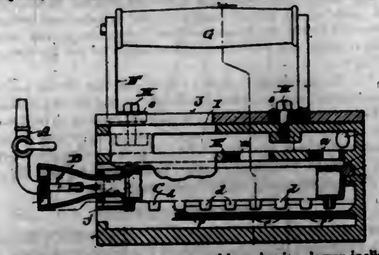
3. In an oil-filter having a receptacle mounted upon a reservoir, said receptacle provided with an inclined or cone-shaped bottom, a cylinder or wall mounted upon said bottom, said cylinder provided near its top with perforations, a cone or hood placed within said cylinder and resting upon the inclined bottom, filtering material placed within said cylinder on top of said cone, a removable strainer provided with a deflecting-shield placed upon said cylinder, substantially as shown and for the purpose set forth.



4. In an oil-filter composed of a receptacle having an inclined bottom, a tube or nipple placed in said bottom at the apex thereof, said nipple used for the purpose of delivering the oil from the filter into the reservoir, a cone or hood removably mounted upon said bottom over the nipple, said cone provided with perforations and covered with fibrous cloth which is for the purpose of preventing any part of the filtering material passing through the perforated cone, a cylinder mounted upon said bottom and surrounding said cone, said cylinder provided with perforations which are for the purpose of allowing the oil to pass into said cylinder and into filtering materis placed therein, a removable strainer placed upon said cylinder, a deflecting-shield carried by said strainer and extending downwardly into and around into the refining or settling chamber, said deflecting-shield acting as a division-wall preventing the dirty oil from passing through the perforations in the cylinder until it is settled or refined, and reaches the lower end of said deflecting-shield, an air-jacket formed on the outer surface of and surrounding said receptacle and a steam-jacket mounted on the outer surface of and surrounding the air-jacket which is for the purpose of communicating a low degree of heat to the oil in the receptacle, substantially as shown and for the purpose set forth.

5. In an oil-filter having a receptacle provided with a steam-jacket, an air-jacket interposed between the steam-jacket and receptacle and surrounding said receptacle, the air-jacket provided with means for regulating the heat in said air-jacket by increasing or decreasing the circulation of air within said air-jacket by increasing or decreasing the air inlet and outlet openings, said steam-jacket being of shorter width than the air-jacket, and is provided with steam through its inlet, a cylinder secured to the bottom of said receptacle a cone placed in said cylinder, said cone provided with perforations and covered with fibrous material, filtering material packed in said cylinder and over the cone, and held compressed by a compressing-plate, a removable strainer provided with a perforated side or wall and solid bottom placed and resting upon the said cylinder, said strainer supporting a deflecting-shield secured to the bottom, and extending downward acting as a division-wall in the refining chamber for the purpose as shown and described.

6. In an oil-filter having a receptacle provided with an inclined bottom designed for strength and provided at its apex with a tube or nipple, a division-wall or cylinder secured to said bottom and extending upwardly and provided with perforations, said division-wall or cylinder forming a refining or settling chamber between it and the wall of the receptacle, faucets secured to said receptacle in communication with the lower or bottom edge of the settling chamber, an air-jacket formed on the side of said receptacle and interposed between the steam-jacket and receptacle, the steam-jacket adapted for the purpose to heat the air in said air-jacket which air if freely circulating will communicate low heat to the oil in the refining-chamber, a deflecting-shield extending into said refining-chamber and secured to a strainer, said strainer removably mounted upon the cylinder substantially as shown and for the purpose set forth.



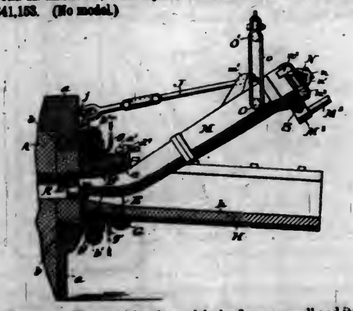
7. In an improved oil-filter, having a receptacle provided with an air and steam jacket on its side, said air-jacket interposed between the steam-jacket and receptacle, said air-jacket being of greater width than the steam-jacket and provided with means to regulate the circulation of air through said air-jacket, said steam-jacket coated on its inner surface with an asbestos cement or other coating, for the prevention of deterioration and for the purpose of decreasing the intensity of heat through its walls, said receptacle provided with an inclined bottom having an outlet at its apex, a division-wall or cylinder secured to said bottom, and provided with perforations, a perforated cone movably mounted in said cylinder and resting on the bottom, a cloth or fibrous material placed over said cone, filtering material tightly compressed in said cylinder and over the cloth-covered cone, a compressing plate placed upon said material, a movable strainer mounted upon said cylinder, said removable strainer having a solid bottom and perforated wall, a deflecting-shield carried by said strainer, and extending into the refining-chamber, substantially as shown and for the purpose set forth.

603,828. GAS-PRODUCER. JAMES FRASER, London, England. Filed June 15, 1896. Serial No. 595,220. (No model.)

Claim.—In combination in a gas-producing apparatus, the producer P, an air and steam supply leading thereto, a pair of regenerators, a connection between the same and the producer P, the gas-engine, a connection between the same and the regenerators and a reversing-valve for controlling the connections between the regenerators and the gas-producer and between the gas-engine and the regenerators so that the exhaust-gases from the engine are sent alternately through the regenerators to heat them for the passage of the partially-formed producer-gas, said valve also sending the producer-gas alternately through the regenerators, the said gas-engine being of sufficient size to use all or nearly all the gas produced at full load.

603,829. SAD-IRON. JOSEPH GRESS, Milwaukee, Wis. Filed Sept. 20, 1897. Serial No. 652,947. (No model.)

Claim.—1. A hollow open-rear sad-iron having lower inclined side apertures deflecting toward its bottom and an apertured horizontal partition dividing the sad-iron into upper and lower compartments, the upper one of which has side and front draft-openings, together with a fuel-gas burner having support in the lower one of said compartments and comprising a tube, an expansion-chamber forming a transversely-enlarged continuation of the tube at the forward end of same, a series of nipples depending from the expansion-chamber, and a gas-cock supported in said tube.



2. A hollow open-rear sad-iron divided by an apertured horizontal partition into upper and lower compartments, the upper one of which has side and front draft-openings, a recess in the point end of the sad-iron inside the latter below said partition, and a fuel-gas burner comprising a forward expansion-chamber having a lip that engages said recess, a series of nipples depending from the expansion-chamber, a rear tube leading into said expansion-chamber, lateral angle-wings extending in opposite directions from the tube, and a gas-cock supported in said tube; rear ledges inside the sad-iron constituting rests for said angle-wings, and set-screws detachably connecting said sad-iron and angle-wings.

3. A hollow open-rear sad-iron divided by an apertured partition into upper and lower compartments, the upper one of which has side and front draft-openings; together with a fuel-gas burner having support in the lower one of said compartments and comprising a tapered tube, an expansion-chamber forming a transversely-enlarged continuation of the tube at the forward end of same, a series of nipples depending from the expansion-chamber, and a gas-cock supported in said tube to have its outlet in the smaller diameter of same.

4. A hollow sad-iron divided by an apertured partition into upper and lower compartments, the upper one of which has side and front draft-openings, rear ledges inside the lower compartment, a fuel-gas burner comprising a forward expansion-chamber, a series of nipples depending from the expansion-chamber, a rear tube leading into said expansion-chamber, a gas-cock supported in the tube, and lateral angular wings extending in opposite directions from said tube to rest on said ledges and have detachable connection with the sad-iron.

5. A hollow open-rear sad-iron divided by an apertured partition into upper and lower compartments, the upper one having side and front draft-openings and the lower one inclined apertures that deflect toward the bottom, together with a fuel-gas burner having support in the lower one of said compartments and comprising a tapered tube, an expansion-chamber forming a transversely-enlarged continuation of the tube at the forward end of same, a series of nipples depending from the expansion-chamber, and a gas-cock supported in said tube to have its outlet in the smaller diameter of same.

603,830. BLAST-FURNACE IRON-NOTCH AND APPLIANCE. JOHN M. HARTMAN, Philadelphia, Pa. Filed June 17, 1897. Serial No. 641,153. (No model.)

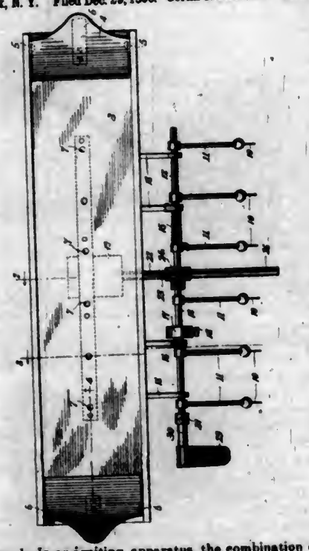
Claim.—1. The combination, with the furnace-wall and its jacket, said wall containing an opening in the usual region for the iron-notch; of a removable door suspended from said jacket and fitting snugly within said opening, said door being also provided with an opening; and an iron-notch fitting within the opening in the door itself, substantially as set forth.

2. The combination with the furnace-wall and its jacket, said wall containing the usual opening for the iron-notch, of the door D, having a surrounding flange d; water-pipes arranged to deliver water within the channel formed by said flange; and a pivoted support for said door, whereby the same may be swung laterally to permit access to the notch-opening, substantially as set forth.

3. The combination with the furnace-wall and its jacket, said wall containing an opening in the usual region of the iron-notch; of the door D, fitting snugly in said opening, said door itself containing an opening; the iron-notch supported in said opening within the door, said door having lateral projections D^3, D^4; the swinging yokes F, F', pivoted to the furnace-jacket on each side of the notch-opening; and devices, such as keys, f^6, f^6, whereby said door is detachably secured on each side to said yokes, substantially as set forth.

4. The combination, with the iron-notch, of the gun M, having a curved muzzle adapted to reach said notch; the lateral stays J; the leg m', adapted to freely engage with said stays; and a swinging support for said gun, whereby the same may be lowered into position and quickly secured, substantially as set forth.

5. The combination with the tubular, pistonless gun having a curved muzzle and adapted to contain a large mass of plastic clay stopping; of an inlet-nozzle for the admission of fluid under pressure to the interior of said gun, said nozzle being arranged at the lower side of the gun's bore near the rear end thereof and opening in the direction of the muzzle, substantially as set forth.



608,831. BICYCLE-BRAKE. FREDERICK H. HEATH, Tacoma, Wash. Filed Jan. 19, 1897. Serial No. 619,716. (No model.)

Claim.—In combination, a housing pivoted to the fork-crown of a bicycle, said housing having flared sides, said sides having indentations cut in their lower edges, spring-arms secured to the sides and projecting below and beyond said indentations, a hollow cylinder to fit within the housing, conical ends formed of sheet metal, of a slant corresponding to the slant of the sides, secured on the ends of the cylinder, hubs formed at the apex of the cones by curving the walls outward and downward to form a groove, said hubs resting on the spring-arms, means for depressing said housing substantially as described.

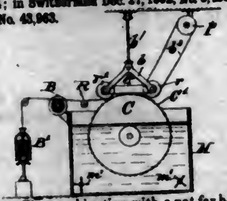
603,331.

603,332. FLASH-LIGHT APPARATUS. ARTHUR R JOHNSTONE, New York, N. Y. Filed Dec. 29, 1896. Serial No. 617,420. (No model.)

Claim.—1. In an igniting apparatus, the combination of a perforated holder for the ignitible compound, one or more movable igniters arranged to strike upwardly from below the holder, and mechanism for operating said igniters, substantially as described.

2. In an igniting apparatus, the combination of the trough or holder provided with the through-slot or perforations in the bottom thereof, the upwardly-striking igniters 10, arranged below the holder, and mechanism for operating said igniters, substantially as described.

3. In an igniting apparatus, the combination of the holder provided with the through-slot or perforations in the bottom thereof, the upwardly-striking igniters pivoted below and to one side of the holder, and mechanism for operating said igniters, substantially as described.



4. In an igniting apparatus, the combination of the perforated holder for the compound, the igniter 10, an air-engine, the shaft 12, the pulley 24 on said shaft, the ligament connecting said pulley with the rod of the air-engine, the spring 15, and connections between said shaft and said igniter, substantially as described

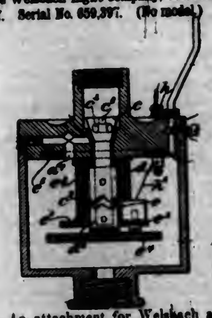
5. In an igniting apparatus, the combination of the perforated holder for the compound, the igniter 10, an air-engine for operating said igniter, and mechanism having an adjustable member for connecting said engine and said igniter 10, substantially as described.

6. In an igniting apparatus, the combination of the perforated holder for the compound, the pivoted upwardly-striking igniter, an air-engine and connections for causing the igniter to strike upwardly, and a retracting-spring for the igniter, substantially as described.

7. In an igniting apparatus, the combination of the foraminous holder for the compound, the rock-shaft 12 below and to one side of the holder, the igniters carried by said shaft and arranged to move through more than ninety degrees, an air-engine and connections for moving the igniters upwardly, and a retracting-spring, substantially as described.

603,333. APPARATUS FOR PREPARING CELLULOSE FOR MANUFACTURING SPUN FABRICS. CARL KELLNER, Vienna, Austria-Hungary. Filed Jan. 4, 1892. Serial No. 417,015. (No model.) Patented in Germany Nov. 20, 1891, No. 73,601; in England Nov. 20, 1891, No. 20,225; in Sweden Nov. 20, 1891, No. 4,042; in Norway Nov. 20, 1891, No. 2,509; in Austria-Hungary Mar. 1, 1892, No. 54,382 and No. 85,064; in Switzerland Dec. 27, 1892, No. 6,458, and in Canada Aug. 18, 1893, No. 43,963.

Claim.—1. The combination with a vat for holding fibrous material in suspension in water, and a cylinder revoluble in said vat and surrounded by a foraminous fabric kept in motion by such cylinder, of means coöperating with said fabric for rolling or rubbing the fiber deposited thereon into roving, for the purpose set forth.



2. The combination with a vat for holding fibrous material in suspension in water, and a cylinder revoluble in said vat and surrounded by a fabric composed of continuous foraminous and like non-foraminous or substantially non-foraminous portions kept in motion by said cylinder, and means coöperating with said fabric for rolling or rubbing the fibrous material deposited on the foraminous portions of said fabric into rovings, for the purpose set forth.

3. The combination with a vat for holding fibrous material in suspension in water, a cylinder revoluble in said vat and clothed with a foraminous fabric; of means coöperating with said cylinder for rolling or rubbing the fibers deposited thereon into roving, for the purpose set forth.

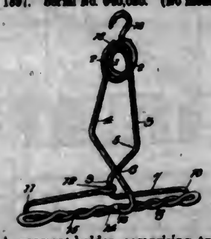
4. The combination with a vat for holding fibrous material in suspension in water, a cylinder revoluble in said vat and clothed with a foraminous fabric; of one or more rolls adapted to reciprocate in the plane of the axis of rotation of said cylinder and coöperating therewith to roll the fibrous material into a roving, and means for reciprocating said roll or rolls, substantially as and for the purpose set forth.

5. The combination with a vat for holding fibrous material in suspension in water, a cylinder revoluble in said vat and clothed with a foraminous fabric; of one or more rolls adapted to reciprocate in the plane of the axis of rotation of said cylinder and coöperating therewith to roll the fibrous material into a roving, and means for revolving and reciprocating said roll or rolls independently of said cylinder, substantially as and for the purpose set forth.

603,334. ELECTRICAL ATTACHMENT FOR GAS-LIGHTS. FRANKLIN L. KELLNER and GEORGE S. BARROWS, Philadelphia, Pa., assignors to the Welsbach Light Company, Gloucester City, N. J. Filed Nov. 22, 1897. Serial No. 659,397. (No model.)

Claim.—1. An attachment for Welsbach and other gas-lights comprising the combination of a gas-admission valve and its complemental seat respectively provided with gasways and adapted to be lifted and turned in respect to each other, a zigzag groove and its complemental pin for effecting rotation of the valves to position said gasways for the admission and exclusion of gas, and electromagnets and their armature and connections for lifting and dropping the valve whereby it is rotated with a step-by-step motion in the same direction, and lifted and dropped at each rotation, substantially as described.

2. An attachment for Welsbach and other gas-lights comprising the combination of a two-part gas-chamber to which gas is supplied, a valve-seat and gasway in the upper part of said chamber, said gasway communicating within the interior thereof and through said seat, a valve provided with lateral gasways opening through its top and with a depending spindle, crown-wheels mounted on the shank of said spindle, an armature on the end of said spindle, electromagnets, a fixed pin coöperating with said crown-wheels, and circuit connections for the electromagnets, substantially as described.



3. In an attachment for Welsbach and other gas-lights, a chamber to which gas is supplied, a valve and its complemental gasways for controlling the admission of gas to the main light, electrical and mechanical devices for operating said valve, a section of a by-pass tube extending from said chamber, means carried by said chamber for controlling the by-pass tube, a section of by-pass tube carried by the burner, and a sleeve or coupling for detachably connecting the said sections of by-pass tube, substantially as described.

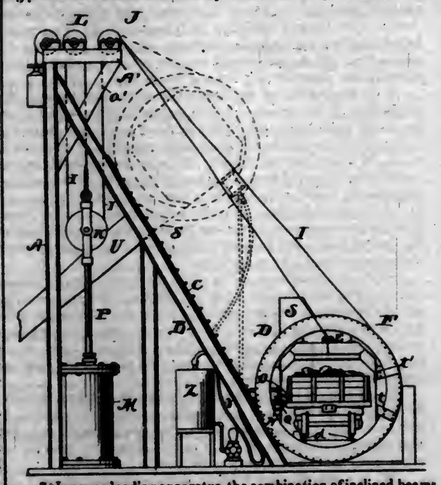
4. In an attachment for Welsbach and other gas-lights, a valve provided with a gasway, a seat provided with a gasway, and electrical and mechanical devices, substantially as described, for rotating said valve in one direction with a step-by-step motion and for unseating and reseating said valve to facilitate the described rotation thereof.

5. In an attachmet for Welsbach and other gas-lights, the combination of a rotary and endwise-movable valve provided with gasways, a valve-seat provided with gasways, a plate-like armature attached to said valve, electromagnets, a zigzag groove on said valve, and a pin coöperating with said groove, whereby the valve is intermittently rotated in the same direction for the admission and exclusion of gas and cleared from and returned to its seat to prevent sticking and facilitate its rotation.

6. In an attachment for Welsbach and other gas-lights, the combination of a valve provided with a gasway and adapted to be lifted and turned to position its gasway, a plate-like armature connected with the valve, electromagnets, and means for lifting, rotating, and quickly dropping the valve, substantially as described.

603,335. GARMENT-HOLDER. ALBERT L. LINCOLN, Bethel, Vt. Filed June 9, 1897. Serial No. 640,095. (No model.)

Claim.—1. A garment-holder, comprising two spring-actuated arms crossed near their lower ends, jaws at the lower ends of the arms normally and yieldingly engaging each other, one of said jaws being in the form of an open link and the other consisting of a twisted or corrugated bar, and a suspending device connected to the upper end of the holder, substantially as described.



2. A garment-holder formed of a single piece of wire bent to form and comprising a series of coils, the middle coil being smaller than the outer ones, arms extending from said coils and bent at an obtuse angle to cross each other, jaws extending laterally from the arms on opposite sides and normally engaging each other, one of said jaws being in the form of an elongated open link and the other consisting of a twisted or corrugated bar of greater length than the link-jaw, substantially as described.

3. A garment-holder formed of a single piece of wire bent to form, and comprising a series of coils at its upper end, the middle coil being smaller than the outer ones, arms extending from said coils and clamping-jaws at the lower ends of the arms, combined with a metal plate secured to the outer coils and extending across above the middle coil, and a hook swiveled in said plate with its head supported on the middle coil, substantially as described.

603,336. CAR-UNLOADING APPARATUS. TIMOTHY LOWE, Cleveland, Ohio. Filed Feb. 11, 1896. Serial No. 578,965. (No model.)

Claim.—1. In a car-unloading apparatus, the combination of a car-holding cradle, and means for holding a car therein, with the rings G G within which the cradle is loosely mounted, mechanism for simultaneously raising and turning said rings, and stop-arms on the cradle and rings respectively, adapted to engage with each other, substantially as and for the purpose specified.

2. In car-unloading apparatus, the combination of a car-holding cradle and means for holding a car therein, with rings G G in which the cradle is loosely mounted, cables for simultaneously raising and turning said rings, whereby the cradle is raised without being turned, and mechanism for connecting the rings and cradle at the proper time, whereby the subsequent turning of the rings will correspondingly turn the cradle, substantially as and for the purpose specified.

3. In car-unloading apparatus, the combination of inclined beams, the rings G G adapted to ride thereon, and mechanism for rolling the rings up said beams, with a car-holding cradle loosely mounted in said rings, means for holding the car in the cradle, and stop-arms on said rings and cradle respectively, substantially as and for the purpose specified.

4. In car-unloading apparatus, the combination of the car-holding cradle provided with end rings E E, the outer rings G G having annular flange plates F F embracing the rings E, spaced friction-rollers H interposed between said outer and inner rings, cables for raising and turning said outer rings, and stop arms on the outer and inner rings respectively, substantially as and for the purpose specified.

5. In car-unloading apparatus, the combination of the car-holding cradle, and the vertical ratchet-bars W^2 secured therein, with the beams V, endwardly-movable ratchet-blocks V^2 mounted in the ends of said beams, and adapted to engage with the ratchet-bars, the wheel X journaled in the middle of the beam, spring-actuated rods r' connecting said ratchet-blocks with the wheel X on opposite sides of its axis, a rope Y attached to and wound on said wheel, and passing up over a sheave at the top of the trestle-tower, a weight attached to the free end of said rope, and a bracket W^3, substantially as and for the purpose specified.

603,337. MACHINE FOR JOINTING TUBES. WILLIAM A. MCCALLUM, Cincinnati, Ohio, assignor to Charles Andrew, same place. Filed Oct. 15, 1896. Serial No. 609,010. (No model.)

Claim.—1. In a tube-jointing machine embodying a longitudinally-extended bed or frame, operating-cylinders at or near the outer ends thereof, having plungers operating outwardly in opposite directions, draw-bars connecting said plungers, and a compression-die movable upon the bed or frame between the cylinders by attachment to the draw-bars, substantially as set forth.

2. In a tube-jointing machine, of the character indicated, the combination of a bed-frame, a fixed operating-cylinder at or near one end thereof, an adjustable withdrawing-cylinder at or near the opposite end thereof, draw-bars connecting the plungers of the cylinders, and an intermediate cross-head adapted to be attached adjustably to and be reciprocated by the draw-bars, and a hollow compression-die carried by the cross-head, substantially as set forth.

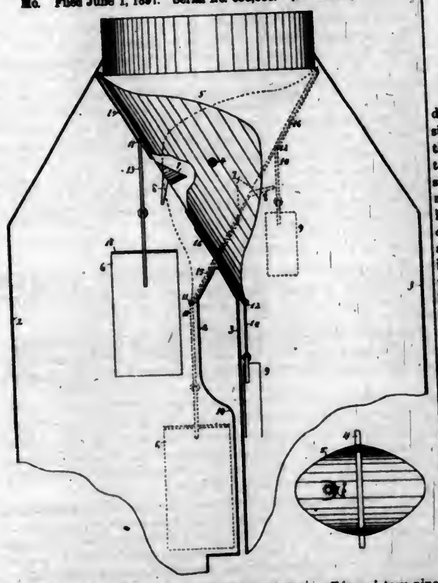
3. In a tube-jointing machine, of the character indicated, in combination with the bed-frame, operating and withdrawing cylinders, the draw-bars and intermediate cross-head, a supplemental cylinder and plunger in connection with the withdrawing-cylinder, said plun-

ger acting as an adjustable backing for the tube under treatment, substantially as set forth.

4. In a tube-jointing machine, the combination of the bed-frame, operating-cylinders, draw-bars and cross-head; the intervening removable carrying-rolls in bearings attached to the bed-frame, substantially as set forth.

5. In a tube-jointing machine of the character indicated, the combination of the bed-frame; oppositely-acting cylinders attached thereto; cross-heads attached to the plungers of the cylinders and moved upon the bed-frame as a support; draw-bars connecting the cross-heads; and a central cross-head or die-carrier adjustably attached to the draw-bars, substantially as set forth.

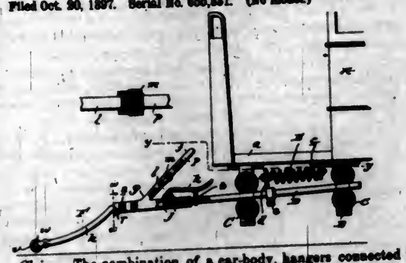
6. In a tube-jointing machine, of the character indicated, the combination of the opposite cylinders, bed-frame, draw-bars, and the cross-head or die-carrier adjustably attached to the draw-bars, and an annular die carried by said cross-head, substantially as set forth.



7. In a tube-jointing machine, of the character indicated, the combination of the bed-frame, opposite cylinders, draw-bars, and the intermediate cross-head adapted to move upon the bed-frame, and provided with lateral wings provided with slots to receive the draw-bars, and removable pins connecting the same with the cross head at any desired points, and an annular die carried by said intermediate cross-head, substantially as set forth.

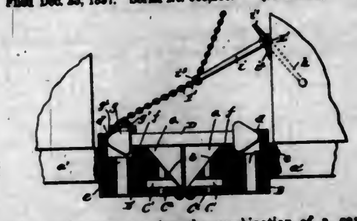
8. In a tube-jointing machine of the character indicated in combination with the motor-cylinders for operating the die, a supplemental cylinder and plunger located at the back of the motor-cylinder with a perforated partition between the two and a take-up plunger operated by said supplemental cylinder against the end of the tube under treatment, to engage the same and accommodate any variations of length, substantially as set forth.

9. In a tube-jointing machine, the combination of the bed-frame, the opposite operating and withdrawing cylinders, the cross-heads and connections, and a pipe connecting the two cylinders, provided with two controlling-valves, and a supply connection entering between said valves, substantially as set forth.



10. In a tube jointing machine of the character indicated, the cross-head or die-carrier constructed with an open vertical slot or socket for the insertion of dies and with lateral wings for connection with the draw-bars, and with bearing-rolls for support and guidance upon the bed-frame, substantially as set forth.

603,338. CISTERN CUT-OFF. JOSEPH MCCOY, Independence, Mo. Filed June 1, 1897. Serial No. 638,333. (No model.)

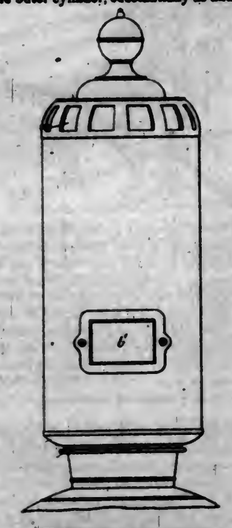


Claim.—The combination with a pivoted cut-off in a cistern-pipe of a weight connected with said cut-off, a vessel connected with said cut-off and means for filling and emptying said vessel, the construction and arrangement being such that as said cut-off changes its position the relation of said weight and vessel to the axis will correspondingly change, substantially as set forth.

603,339. CAR-FENDER. JOHN I. NEWSOME, Vicksburg, Miss. Filed Oct. 20, 1897. Serial No. 656,231. (No model.)

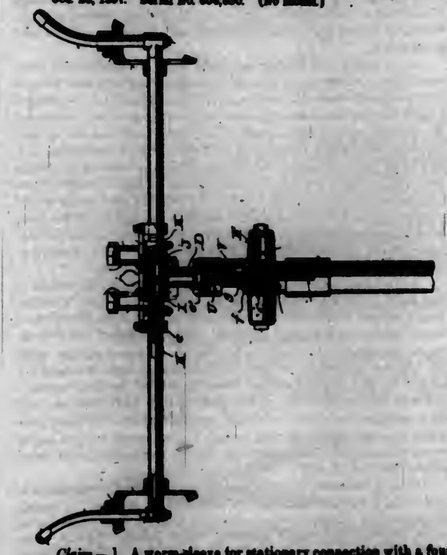
Claim.—The combination of a car-body, hangers connected to and depending from said body adjacent to each side thereof, the lower and upper wheels arranged in the hangers and disposed in the direction of the length of the car, the rods D arranged and adapted to move between the upper and lower wheels and having the vertically-disposed apertures *b* adjacent to their outer ends, coiled springs connected at one end with the car-body and at their opposite ends to arms on the rods, and the detachable fender proper having the frame comprising the section *g* provided with the tubular side bars *j* receiving the forward ends of the rods D and having their forward ends flattened and provided with lateral lugs *r*, the hooks *k* pivotally connected to the said side bars *j* and adapted to enter the apertures of the rods, and the section A connected in a hinged manner to the flattened ends of the side bars of the section *g* above the lugs *r* thereof and adapted to fold back on the same, and netting or other suitable textile arranged within and connected to the frame, substantially as specified.

603,340. CAR-COUPLING. JOHN I. NEWSOME, Vicksburg, Miss. Filed Dec. 23, 1897. Serial No. 663,200. (No model.)



Claim.—In a car-coupler, the combination of a car-body, a draw-head formed in one piece and having the recess C in its upper side comprising the mouth *a* corresponding in width and height to the draw-head at the outer end thereof and having the inclined bottom wall of concave form in cross-section and also having the flaring side walls *c*, the pocket *d*, and the longitudinal central groove *f* connecting the mouth and the pocket; said draw-head also having the horizontal recess, at an intermediate point of its height, communicating at its outer end with the mouth *a*, and the vertically-disposed aperture intersecting said horizontal recess, the link having heads at its opposite ends; one of said heads being designed to rest in the pocket *d* of the draw-head, a clevis disposed longitudinally of the link, a bolt extending longitudinally through the outer head of the link and pivotally connecting the clevis thereto so as to enable the same to rock laterally on the link, the rock-shaft journaled in bearings on the end wall on the car-body and having the forwardly-extending arm i and also having the upper and lower stop-arms *l*, *l*, adapted to engage the end wall of the car-body, a chain connected at one end to the clevis on the outer head of the link and at its opposite end to the car-body, and a bolt detachably connecting the chain and the arm i of the rock-shaft, substantially as specified.

603,341. LAMP-STOVE. JOSEPH R. NICHOLS, Rochester, N. H. Filed July 23, 1897. Serial No. 645,685. (No model.)



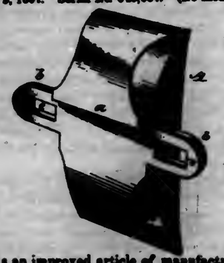
Claim.—1. In combination with a lamp, a metallic cylinder adapted to be removably attached to the upper end of the lamp; a head or cover secured to the top of said cylinder, and provided with apertures as described; and an inner approximately air-tight cylindrical body secured to said head or cover and projecting within the outer cylinder to a point near the burner, providing an annular space between the cylinders, said cylindrical body being practically non-conductive of heat, all substantially as and for the purposes set forth.

2. In combination with a lamp, a metallic cylinder adapted to be removably attached to the upper end of the lamp; a head or cover

secured to the top of said cylinder and provided with apertures as described, an inner cylinder concentric with the outer cylinder and approximately air-tight to preclude conductivity of heat, secured to said head or cover and projecting within the outer cylinder to a point near the burner, providing an annular space between the cylinders, said inner cylinder having a cone-shaped lower end; and an annular metallic shield removably interposed between the burner and the lower end of the outer cylinder, substantially as and for the purposes set forth.

603,342. FOUNTAIN. BERNHOF ORT, La Crosse, Wis. Filed Oct. 26, 1897. Serial No. 656,630. (No model.)

Claim.—1. A worm-sleeve for stationary connection with a fountain stand-pipe, a hollow stem having rotative engagement with the worm-sleeve, pipes extending laterally in opposite directions from the stem and having discharge-terminals at suitable angles, hollow stem-arms extending in opposite directions and having perforated horizontal shell-terminals, hollow perforated spigots in these arm-terminals, and worm-wheels made fast to the spigots to mesh with said worm-sleeve.



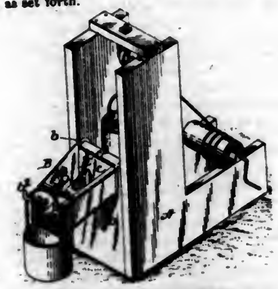
2. A worm-sleeve for stationary connection with a fountain stand-pipe, a hollow stem having rotative engagement with the worm sleeve, arms extending in opposite directions from the stem, worm-wheels in rotative connection with the stem-arms to mesh with said worm-sleeve, other wheels in rotative connection with stem-arm branches and having intermittent motion imparted thereto from the worm-wheels, pipes having hollow perforated spigot-terminals engaging perforated horizontal protuberances of said stem, the other terminals of these pipes being at suitable angles, pipe-supports in connection with the aforesaid stem, levers fast to the pipes, and links connecting the levers with the intermittently-driven wheels.

3. A worm-sleeve for stationary connection with a fountain stand-pipe, a hollow stem having rotative engagement with the worm-sleeve, arms extending in opposite directions from the stem, worm-wheels in rotative connection with the stem-arms to mesh with said worm-sleeve, other wheels in rotative connection with stem-arm branches and having intermittent motion imparted thereto from the worm-wheels, pipes having hollow perforated spigot-terminals engaging perforated horizontal protuberances of said stem, other pipes in ground-joint union with the ones aforesaid, bevel-pinions fast on the latter pipes and meshed with bevel gear-wheels fast on supporting-sleeves engaged by the former pipes, levers fast to the sleeve-engaging pipes, and links connecting the levers with the intermittently driven wheels.

4. A worm-sleeve for stationary connection with a fountain stand-pipe, a hollow stem having rotative engagement with the worm-sleeve, hollow arms extending in opposite directions from the stem and having perforated horizontal shell-terminals, hollow perforated spigots in these arm-terminals, worm-wheels made fast to the spigots to mesh with said worm-sleeve, other wheels in rotative connection with stem-arm branches and having intermittent rotation imparted thereto from the worm-wheels, pipes having hollow perforated spigot-terminals engaging perforated horizontal protuberances of said stem, the other terminals of these pipes being at suitable angles, pipe-supports in connection with the aforesaid stem, levers fast to the pipes, and links connecting the levers with intermittently-driven wheels.

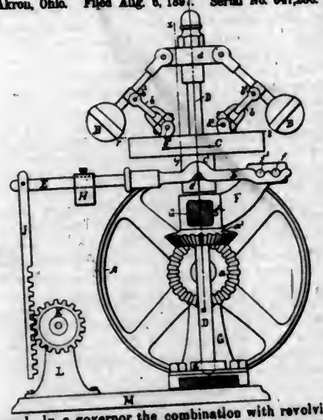
5. A worm-sleeve for stationary connection with a fountain stand-pipe, a hollow stem having rotative engagement with the worm-sleeve, hollow arms extending in opposite directions from the stem, and having horizontal perforated shell-terminals, hollow perforated spigots in these arm-terminals, worm-wheels made fast to the spigots to mesh with said worm-sleeve, other wheels in rotative connection with the stem-arm branches and having intermittent motion imparted thereto from the worm-wheels, pipes having hollow perforated spigot-terminals engaging horizontal perforated protuberances of said stem, other pipes in ground-joint union with the ones aforesaid, bevel-pinions fast on the latter pipes and meshed with bevel gear-wheels fast on supporting-sleeves engaged by the former pipes, levers fast to the sleeve-engaging pipes, and links connecting the levers with the intermittently-driven wheels.

603,343. BRAKE-SHOE. JOHN H. PRIBBLE, Milledgeville, Pa. Filed June 9, 1897. Serial No. 640,007. (No model.)



Claim.—As an improved article of manufacture, a metal brake shoe or block cast with a bearing-flange or overhanging shoulder extending across its outer side the entire width thereof and also cast with laterally-extending arms upon each side of the shoe or block which have elongated openings to admit of the adjustment of said shoe or block to the disk of the wheel when secured by bolts, substantially as and for the purpose set forth.

603,344. TROUGH FOR WELL-CURBS. JAMES R. G. REEVES, McComb City, Miss. Filed Nov. 13, 1897. Serial No. 658,208. (No model.)



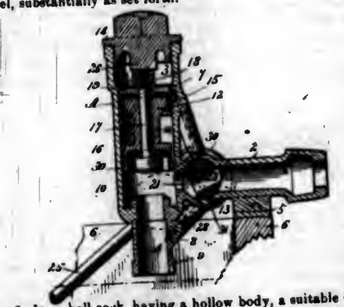
Claim.—1. A well-curb attachment, consisting of the rods, *b*, having the downturned ends, *b'*, and the upturned ends, *b²*, and the sheet-metal body, C, secured to such rods, as set forth.

2. A well-curb attachment, consisting of the rods, *b*, having the downturned ends, *b'*, and upturned ends, *b²*, the sheet-metal body, C, having one end open and the other closed and provided with a lip, *c²*, extending beyond the closed end, *c*, as set forth.

3. A well-curb attachment, consisting of the side rods, *b*, having the downturned ends, *b'*, and upturned ends, *b²*, the sheet-metal body, C, and the vertical pin, E, projecting upwardly from the bottom of the body, C, as set forth.

603,345. MECHANICAL SPEED-GOVERNOR. MARK A. REPLOGLE, Akron, Ohio. Filed Aug. 6, 1897. Serial No. 647,286. (No model.)

Claim.—1. In a governor the combination with revolving pendulums of a weight suspended from them by universal joints the said weight adapted to perform the operation required of the governor independent of a rise or fall of the pendulums by reason of retrogression or advancing of the said weight in its relation to the said pendulums.



2. In a speed-governor, the combination of centrifugal weights, having suspended from them, by universally-jointed supports, an inertia weight, the said inertia weight being integrally made with a sleeve sliding on the spindle of the governor, and adapted to rise and fall in conjunction with the centrifugal weights, and also to rise and fall independently, in its relation to them, in the manner described, and for the purposes set forth.

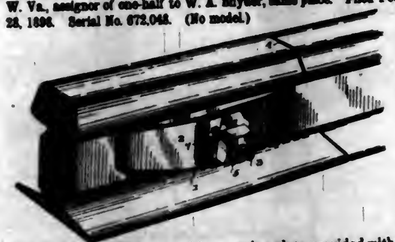
3. In a mechanical speed-governor the combination of centrifugal weights or pendulums, designed to be affected by greater changes of speed, a weight suspended from them adapted to be raised or lowered in conjunction with said pendulums; and in addition thereto, adapted to be raised or lowered in its relation to said pendulums by minor changes in speed, by means as specified.

4. The herein-described mechanical governor consisting of a spindle, adapted to revolve centrifugal weights, centrifugal weights suspended therefrom, and an inertia weight suspended from said centrifugal weights, said inertia weight being integrally made or rigidly attached to a sleeve sliding upward and downward of said spindle, and attached to a lever intermediate of its fulcrum and operating end, for the purpose of amplifying the action of the governor, substantially as specified.

603,346. BALL-COCK. HARRY A. SEDGWICK, Athol, Mass. Filed Sept. 22, 1896. Serial No. 606,656. (No model.)

Claim.—1. In a ball-cock having a hollow body, a suitable outlet from said body, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel, and the opposite ends of the interior of said body, combined with a moving valve within said body acting to close and open said outlet, a rotary valve acting in said barrel having a transverse water-passage 22, therethrough whose extremities communicate, simultaneously, with the extremities of said passages 7 and 8, within said valve-barrel, substantially as set forth.

2. In a ball-cock having a hollow body, a suitable outlet from said body, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel, and the opposite ends of the interior of said body, combined with a moving valve within said body acting to close and open said outlet, a rotary valve acting in said barrel for controlling the water-supply to the ball-cock, having a transverse water-passage 22, therethrough whose extremities communicate, simultaneously, with the extremities of said passages 7 and 8, within said valve-barrel, and a main transverse water-passage 21, therethrough, substantially as set forth.



3. In a ball-cock having a hollow body, a suitable outlet from said body, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel and the opposite ends of the interior of said body, combined with a moving valve within said body acting to close and open said outlet, a rotary valve acting in said barrel for controlling the water-supply to the ball-cock, having a main transverse water-passage 21, therethrough, and a passage 23, forming water communication between said passage 21, and the surface of said rotary valve, for communication with one extremity of said hollow body, through said passage 7, substantially as set forth.

4. In a ball-cock having a hollow body, a suitable outlet from said body, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel and the opposite ends of the interior of said body, combined with a moving valve within said body acting to close and open said outlet, a rotary valve acting in said barrel for controlling the water-supply to the ball-cock having a transverse water-passage 22, therethrough whose extremities communicate, simultaneously, with the extremities of said passages 7 and 8, within said valve-barrel, a passage 23, forming water communication between said passage 21, and the surface of said rotary valve, for communication between one extremity of said hollow body and said passage 21, substantially as set forth.

5. In a ball-cock having a hollow body, a circular valve-seat in said body, a circular chamber 28, surrounding said seat, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel and the opposite ends of the interior of said body, combined with the valve 12, having an inverted cup-shaped lower extremity for free entrance into said circular chamber, and a packing-disk 16, within said cup for engagement with said valve-seat, the rotary valve 13, having the water-passages 21 and 22, transversely therethrough at right angles to each other, and suitable ball-float devices connected to said valve, substantially as set forth.

6. In a ball-cock having a hollow body, a circular valve-seat in said body, a circular chamber 28, surrounding said seat, a water-supply branch communicating with said body, a cylindrical valve-barrel between said branch and body, water-passages 7 and 8, forming communication between the interior of said barrel and the opposite ends of the interior of said body, combined with the valve 12, comprising the body *a*, thereof, having an inverted cup-shaped lower end for free entrance into said chamber, a packing-disk 16, within said cup for engagement with said valve-seat, a "hat-brim" packing 15, inclosing the upper end of said valve-body, a metal washer lying upon said packing 15, and the bolt 17, having a head for entrance within said valve-seat, and a shank extending through said valve-body, packing-disk, packing, and washer, and means for securing said bolt in said valve, the rotary valve 13, having the water-passages 21 and 22, transversely therethrough, at right angles to each other, and suitable ball float devices connected to said rotary valve, substantially as set forth.

603,347. NUT-LOCK. HENRY A. THOMASON, Mount Hope, W. Va., assignor of one-half to W. A. Snyder, same place. Filed Feb. 28, 1898. Serial No. 672,048. (No model.)

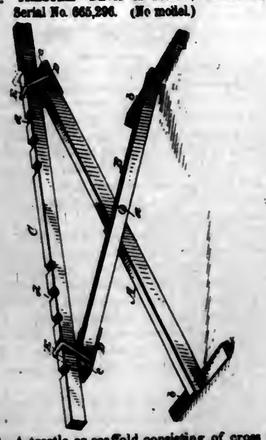
Claim.—1. A nut-lock comprising a spring-plate provided with a locking-spring for engaging the nut, and having, adjacent to the free end of the spring, a socket adapted to receive the engaging end of the tool and formed by upsetting or bending the plate outward, substantially as and for the purpose described.

2. A nut-lock constructed of resilient material and consisting of a plate provided between its edges with an integral locking-tongue formed by splitting the plate, the latter being upset or bent outward at the outer side of the free end of the spring to form a socket to receive a tool, whereby the spring may be readily held in a depressed position, substantially as described.

603,348. REMOVABLE HEAD OR COVER FOR BARRELS, &c. GEORGE F. THOMPSON, Omaha, Nebr. Filed July 20, 1897. Serial No. 645,203. (No model.)

Claim.—A removable head or cover for barrels, casks, and vessels comprising a cover proper, having a metallic rim encircling and embracing the same and rigidly secured to the cover, depending hooks, at regular intervals, upon said rim, a rim of elastic material secured to the lower edge of the cover proper, a metallic hoop secured to the upper ends of the vessel's staves, having an inwardly-turned portion or edge, the extremity of the latter being driven into the staves, lugs having smooth lower surfaces inclined upwardly secured to the outside of the rim, at regular intervals, under which said hooks engage, rings upon the top of the barrel-cover, and a lever insertible therein to revolve the head or cover to secure the same upon the vessel, substantially as set forth.

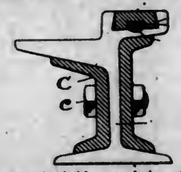
603,349. COMBINATION CUTTER, CONNECTOR, AND PLIERS. CHARLES P. TOWARD, Worcester, Mass., assignor of one-half to E. Delmont Merrill and Frank D. Folsom. Filed May 26, 1897. Serial No. 638,181. (No model.)



Claim.—In a tool of the kind described, the combination of the jaws and handles pivotally connected, said jaws having the transverse recesses or grooves upon both sides of the pivot, the forward portion of the jaws being recessed from both sides to provide central cutting-jaws, and also recessed from one side to provide a side cutting edge, substantially as shown and described.

603,350. BOTTLE. EDMUND TOWERS, Yonkers, N. Y., assignor of three-fourths to John Gibney and John C. S. Wells, Sing Sing, N. Y. Filed Jan. 12, 1897. Serial No. 618,974. (No model.)

Claim.—The combination of a bottle having a recess formed within the outer surface of the neck thereof and a recess formed within the inner surface of said neck, these said recesses being separated by means of a thin disk forming an integral part of the neck of the bottle, said neck also having a groove therein, located opposite to the said recess; with a bottle stopper having a tongue thereon for engagement with the groove of a bottle-neck, and a recess therein located opposite to said tongue for holding the bow-spring, the outwardly-extending arm of said bow-spring engaging with the inner recess of the neck of the bottle, said stopper also having a recess within the head thereof for receiving a tool for opening the bottle, substantially as shown and described.



603,351. TRESTLE. DAVID R. TURPIN, Fairmount, Ill. Filed Jan. 3, 1898. Serial No. 665,296. (No model.)

Claim.—1. A trestle or scaffold consisting of cross feet or legs pivoted together, pivoted or swinging coupling-links upon the upper ends thereof, and a detachable notched beam adapted to rest upon the ends of the feet or legs, substantially as and for the purpose set forth.

2. A trestle or scaffold consisting of cross feet or legs pivoted together and provided with cross bars or supports at their lower ends and at their upper ends suitably beveled with wearing-plates secured thereto, coupling-links connected to the upper ends of the feet or legs, and a notched supporting-beam with which the links engage, substantially as and for the purpose described.

603,352. RAIL-JOINT BRIDGE. FRANK R. WAGNER and ANDREW W. FOOTE, Cleveland, Ohio. Filed Aug. 14, 1897. Serial No. 648,261. (No model.)

Claim.—1. A rail-joint bridge consisting of a metal block having parallel beveled side edges, which block is longitudinally bent to draw the lower side edges toward each other, substantially as specified.

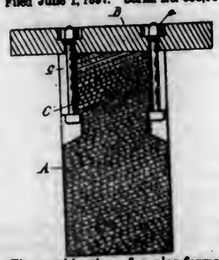
2. A rail-joint bridge consisting of a metal block having parallel beveled side edges and having in its lower face a longitudinal groove, adapted to contain an electrical bond, substantially as specified.

3. In a rail-joint bridge, the combination of two contiguous rail ends, and a bridge-piece which is dovetailed into the tops of said rails and an electrical bond confined between said bridge-piece and rails, substantially as specified.

4. The combination of two alined rails, each having in its top

surface a longitudinal groove with parallel undercut sides, with a bridge-block which lies in and fits said grooves and bridges the space between the rail ends, and an electrical bond confined in a longitudinal groove between the bridge-block and both rails, substantially as specified.

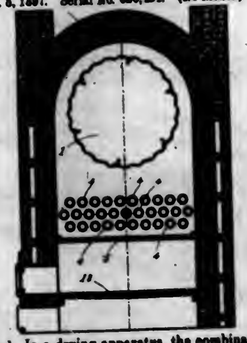
608,853. SHAFT-ADJUSTING DEVICE. LEWIS R. WARNER, Northampton, Mass. Filed Aug. 4, 1897. Serial No. 647,115. (No model.)



Claim.—1. Adjusting devices for the take-up roll of the drying-cylinder felt in paper-machines and analogous purposes, consisting of two parallel frames, a shaft located transversely between them, said frames being provided with slots through which the ends of said shaft protrude, operating-wheels pivotally supported on said frames in proximity to the ends of said shafts, there being a spiral-groove on the inner side of each of said wheels and means of engagement between the ends of said shaft and said spiral grooves whereby the rotation of the said wheel will cause a horizontal movement to said shaft in said slots, substantially as described.

2. Adjusting devices for the take-up roll of the drying-cylinder felt in paper-machines and analogous purposes, consisting of two parallel frames, a shaft located transversely between them, said frames being provided with slots, blocks in said slots in which the ends of said shaft are supported, operating-wheels pivotally supported on said frames in proximity to said blocks, there being a spiral groove on the inner side of each of said wheels, and means of engagement between said blocks and said grooves, whereby by the rotation of said wheels said blocks are given a horizontal movement in said slots, substantially as described.

3. Adjusting devices for the take-up roll of the drying-cylinder felt in paper-machines and analogous purposes consisting of two parallel frames, a shaft located transversely between them, said frames being provided with slots through which the ends of said shaft protrude, operating-wheels pivotally supported on the ends of said shaft, in proximity to the sides of said frames, there being a spiral groove on the inner side of each of said wheels, a stud on each of said frames adapted to engage the spiral grooves in said wheels, whereby the rotation of the latter will cause a horizontal movement to said shaft in said slots, substantially as described.

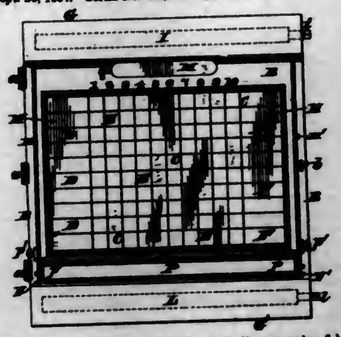


608,854. FOUNDATION-PIER. BENJAMIN F. WILLISTON, Jackson, Mich., assignor of one-half to H. D. Miles and W. P. Harris, Detroit, Mich. Filed June 1, 1897. Serial No. 638,989. (No model.)

Claim.—1. The combination of a pier formed with recesses in opposite sides thereof, the cap extending over the sides containing such recesses and the bolts located in said recesses detachably securing it to the pier.

2. The combination of the concrete pier *a* provided with quak panels G and recesses *c* upon opposite sides respectively, the wooden cap B extending over the sides containing the recesses and the headed bolts C detachably engaging into the recesses *c* and uniting the pier and cap detachably together.

608,855. ROTARY DRIER. HERBERT H. WING, Buffalo, N. Y. Filed Mar. 8, 1897. Serial No. 626,431. (No model.)



Claim.—1. In a drying apparatus, the combination of a rotary drying-shell mounted in suitable bearings, a furnace, a series of air-circulating pipes located near said drying-shell, a perforated metal diaphragm located between said pipes and the furnace, and means for rotating said drying-shell.

2. In a rotary drying apparatus, the combination of a rotary drying-shell, means for rotating it, means for insulating the interior of the drying-shell from the products of combustion, a series of air-circulating pipes communicating with the rotary shell and the outside air-having their interiors insulated from the surrounding products of combustion, and a perforated metal diaphragm located between said air-circulating pipes and the combustion-chamber.

3. In a drying apparatus, a rotary drying-shell connected to its supporting and operating shafting by an expansible universal joint.

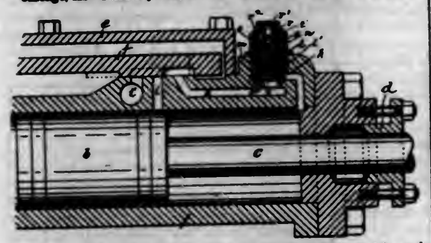
4. In a drying apparatus, an inclosed rotary drying-shell having its greatest length exposed to the furnace-chamber and in open communication with a chamber separated from the furnace chamber, and communicating with radiating-pipes which pass through said furnace-chamber and are in open communication with the air outside of said drying apparatus and a perforated metal diaphragm located between said radiating-pipes and the source of heat.

608,856. SCORING DEVICE FOR GAMES. ADOLPH ZENTERMANN, Cincinnati, Ohio, assignor of one-half to Carl Fritze, same place. Filed Sept. 20, 1897. Serial No. 652,340. (No model.)

Claim.—1. A game score device including a pair of horizontal drums or shafts; a single record-sheet that is uncoiled from one shaft and wound around the other; and a reticulated front behind which said sheet is caused to pass; said front being free from a glass, in order that a pencil may be inserted directly through an opening and inscribe said sheet, in the manner described, and for the purpose stated.

2. A game score device including the back A, having bearings H, H', K, K', horizontal drums or shafts I, L, journaled in said bearings; a single record-sheet M, coiled around said shafts; a frame B having a grating C attached to it; and boxes G, G', secured to this frame and inclosing said drums, the frame being free from a glass, in order that a pencil may be inserted directly through an opening and inscribe said sheet, in the manner described, and for the purpose stated.

3. In a game score device provided with a reticulated front, a roller O journaled below said front, a screen P coiled around said roller, a cross-bar *p* secured to the upper margin of said screen, and means



for fastening said rod at any desired elevation, so as to conceal more or less of said front, all as herein described, and set forth.

608,857. ROTARY BUFFING-ROLL. PRESTON A. BAGLEY, Peabody, Mass. Filed July 26, 1897. Serial No. 645,912. (No model.)

Claim.—In a buffing-roll in combination a metal body, an annular rubber cushion or cover secured to the former, said body and rubber covering being longitudinally slitted, an abrasive covering having crimped or creased lips or edges adapted to be inserted through said slit, and a segmental locking-spindle journaled in a longitudinal cavity *a*, in said roll-body and having one of its edges F' made rounded or cam-shaped for guiding the edges of the abrasive covering into locking position within the cavity *a*, and having its opposite edge F'' made pointed for expelling the lips of the abrasive covering substantially as and for the purpose set forth.

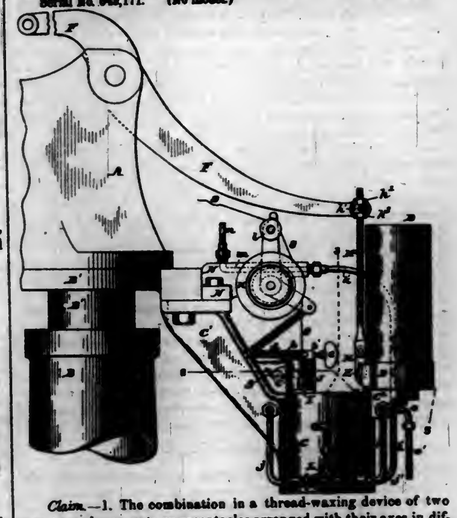
608,858. DIRECT-ACTING ENGINE. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machinery Company, same place and Chicago, Ill. Filed Sept. 23, 1897. Serial No. 652,685. (No model.)

Claim.—1. In a direct-acting engine, the combination with a cylinder having inlet and exhaust ports, of a main valve controlling same, a piston working in said cylinder, an auxiliary valve located so as to control the inflowing air to the front end of said cylinder, and means for regulating the movement of said auxiliary valve by the cushioned air, substantially as set forth.

2. In a direct-acting engine, the combination with a cylinder having inlet and exhaust ports, of a main valve controlling same, a piston working in said cylinder, an auxiliary valve located so as to control the inflowing air to the front end of said cylinder, said auxiliary valve having an air-chamber back of same, and said chamber communicating with said cylinder, substantially as set forth.

3. In a direct-acting engine, the combination with a cylinder having inlet and exhaust ports, of a main valve controlling same, a piston working in said cylinder, an auxiliary valve located so as to control the inflowing air to the front end of said cylinder, said auxiliary valve having an air-chamber back of same, said chamber communicating with said cylinder, and means for reducing the pressure in said chamber, substantially as set forth.

4. In a direct-acting engine, the combination with a cylinder and a piston working therein, of a check-valve controlling the inlet-port of said cylinder, said valve having an air-chamber back of same, said check-valve having a port forming communication between said cylinder and said chamber, substantially as set forth.



5. In a direct-acting engine, the combination with a cylinder and a piston working therein, of a check-valve controlling the inlet-port of said cylinder, said valve having an air-chamber back of same, said check-valve having a port forming communication between said cylinder and said chamber, and said port having a contracted opening, substantially as set forth.

6. In a direct-acting engine, the combination with a cylinder and a piston working therein, of a check-valve controlling the inlet-port of said cylinder, said valve having an air-chamber back of same, a stem, said valve having a port formed therein and in the stem, said port forming communication between said cylinder and chamber, substantially as set forth.

7. In a direct-acting engine, the combination with a cylinder and a piston working therein, of a check-valve controlling the inlet-port of said cylinder, said valve having an air-chamber back of same, said chamber communicating with said cylinder, and a packing-cup on said valve engaging the walls of said chamber, substantially as set forth.

8. In a direct-acting engine, the combination with a cylinder and a piston working therein, of a check-valve controlling the inlet-port of said cylinder, said valve having an air-chamber back of same, said chamber communicating with said cylinder, and a packing-cup inserted between said valve and a head on the stem thereof and engaging the walls of said chamber, substantially as set forth.

608,859. THREAD-WAXING DEVICE FOR SEWING-MACHINES. JOSEPH R. BERTRAND, Boston, Mass., assignor to the Bay State Shoe Machinery Company, Portland, Me. Filed Aug. 23, 1897. Serial No. 649,171. (No model.)

Claim.—1. The combination in a thread-waxing device of two open-topped wax pots or receptacles arranged with their axes in different vertical planes, and with the bottom of one pot above the top of the other, the more elevated of said receptacles being provided near its bottom with a lateral discharge-orifice through which wax melted in said receptacle may be discharged into said lower receptacle: means for applying a limited amount of heat to said upper receptacle to melt the lower portion of the wax contained therein without melting the bulk thereof, means for applying sufficient heat to said lower wax-pot to maintain the wax contained therein at the desired working temperature and means for intermittently and automatically opening and closing said discharge-orifice.

2. The combination in a thread-waxing device of two wax pots or receptacles located at different levels and with their axes in different vertical planes, the more elevated of said receptacles being provided with a lateral discharge-orifice near its bottom and on its side toward the lower receptacle through which wax may be discharged from the upper into the lower receptacle both of said receptacles having open upper ends; means for intermittently opening and closing said discharge-orifice automatically; means for conducting the thread to be waxed into and out of the wax in said lower receptacle through its open end; and means for applying steam heat to both of said receptacles, and regulating the same, whereby a greater degree of heat is applied to the lower receptacle than to the upper.

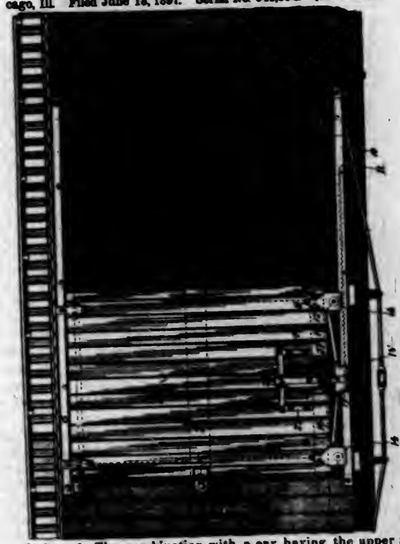
3. In a thread-waxing device the combination of two wax-pots located at different levels and with their axes in different vertical planes, the more elevated of said pots being provided with a lateral discharge-orifice near its bottom and on its side toward the lower pot; a pivoted and vertically-movable gate for opening and closing said orifice; a pivoted lever; a cam for vibrating said lever; and a rod or link connecting said lever to the free or movable end of said gate.

4. In a thread-waxing device the combination of the wax-pot C provided with the steam-passage *i* through its bottom and having the brackets C' and C² formed integral therewith and each provided with steam-passages therethrough; the pot D mounted upon the bracket C² and provided with the discharge-orifice *a*; the vertically-vibrating gate E; the steam-pipes *n*, *m*, *l'*, *k*, *j*, *j'*, *o*, and *o'* the T's M and M' and the valves L and L' all constructed, arranged, and operating substantially as described.

608,360. REMOVABLE CALK FOR HORSESHOES. WILLIAM J. BROWNING, Bayonne, N. J. Filed Dec. 31, 1897. Serial No. 664,904. (No model.)

Claim.—1. In a calk for horses' shoes, a strap A having secured thereto metal plates B, having side laps *c* which hold a wire *f*, which forms a suitable hinge for a plate E provided with spurs and adapted to be secured to a center strip C, substantially as shown and described.

2. In a removable calk for horses' shoes, a strap A having secured thereto plates B, plates E hinged thereto and provided with spurs and held in place by a center strip C, substantially as shown and described.



3. The combination, in a removable calk for horses' shoes, of a strap A held together by a threaded screw D operated by a thumb-screw F, and side plates B secured to the strap A and having hinged thereto plates E carrying spurs *b* and finding support through a fastening to a metal center strip C adapted to fit into the frog of a horse's foot, substantially as shown and described.

4. In a device of the sort described, a strap adapted to be tightened by a thumb-screw, operating a threaded screw, which holds the ends of the strap together, side plates secured to the strap, spur-carrying plates hinged thereto and adapted to be secured to a metal center strip fitting into the hoof of the horse's foot, substantially as shown and described.

608,361. PROCESS OF MAKING PEROXID OF LEAD FOR GALVANIC BATTERIES. JAMES D. DARLING, Philadelphia, Pa., assignor to the Harrison Bros. & Company, Incorporated, same place. Filed Dec. 23, 1896. Serial No. 616,775. (No specimens.)

Claim.—The hereinbefore-described process of making elements of peroxid of lead, which consists in compressing a mass of peroxid of lead containing free acid, and then exposing said mass to electrolytic action as a cathode in a neutral electrolyte until the superficial layer of the mass has been rendered coherent by the production of inherently-formed binding material, substantially as set forth

608,362. CAR-DOOR FASTENING. WILLIAM O. DAVIES, Jr., Chicago, Ill. Filed June 18, 1897. Serial No. 641,334. (No model.)

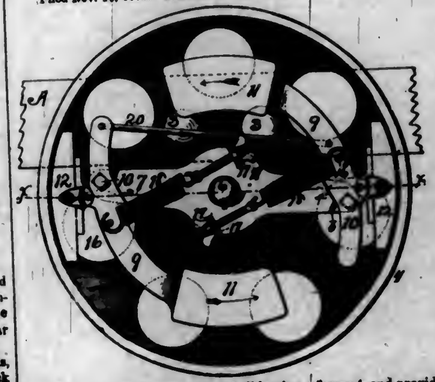
Claim.—1. The combination with a car having the upper and lower tracks of a sliding door; and locking means for said door consisting of the series of teeth in connection with the lower track, the dog 17 having teeth, the bar 19, the strap 24, and the rectangular levers 20, having handles 22; in substance as set forth.

2. The combination with the car, having upper and lower tracks, of a sliding door supported and guided by said tracks, the lower track being located directly beneath the lower edge of the door; shoes having edges 14 overlapping the lower track; and a reciprocating locking bar and dog on the door, said dog engaging teeth on the lower track and also overlapping the upper edge of the same when dropped, thereby preventing the displacement of the door; in substance as set forth.

3. The combination with a car and sliding door supported and guided by lower and upper tracks on the car, of a reciprocating locking bar and dog carried by the door; said lower track supporting teeth to be engaged by the dog, and said dog having a tip 18 which serves in connection with the teeth 18, when the dog is dropped, to prevent an outward displacement of the door; in substance as set forth.

4. The combination with a car and sliding door of locking means consisting of a series of teeth on the car; a reciprocating locking bar and dog on the door; and lever-arms 20 having handles, said levers being pivoted to the bar 19 and to the door; in substance as set forth.

5. The combination with a car, having upper and lower tracks, of a sliding door supported on the lower track by sheaves journaled in shoes; a series of teeth on the car below the door; and a reciprocating locking bar and dog supported on the door and guided by a strap having a staple adapted to receive a perforated bar carried by the reciprocating bar; in substance as set forth.

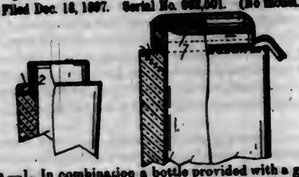


6. The combination with a car, having upper and lower tracks, of a sliding door supported on the lower track by sheaves journaled in shoes; a series of teeth located on the inside of the lower track and out of the path of the shoes; a reciprocating locking bar and dog on the door; and bars, as 16, pivoted to the said shoes and dog; in substance as set forth.

7. The combination with a car-body having an upper guide-track and a lower track, of a sliding door located beneath the upper track and provided with hangers at the top edge thereof, said door supported on the lower track by sheaves journaled in shoes having edges 14 overlapping the said lower track on each side; a series of teeth on the car below the door; a reciprocating locking bar and dog normally under the action of gravity engaging the teeth; and two levers each pivoted to the door and locking-bar; in substance as set forth.

8. The combination with a car-body having an upper guide-track and a lower track, of a sliding door located beneath the upper track, said door provided at its upper edge with guide-hangers, as 8, loosely engaging the said upper track, and at its lower edge with shoes carrying sheaves which support the door on the lower track; a series of teeth on the car below the lower edge of the door; a reciprocating bar and dog actuated by gravity and guided by a strap on the door; and a lever pivoted to the door and locking bar for raising the latter and the dog; in substance as set forth.

9. The combination with a car-body having an upper guide-track and a lower track, of a sliding door located in the same perpendicular plane as the upper track and beneath said track, said door provided at its top edge with guide-hangers loosely engaging the upper track, and at its lower edge with shoes carrying sheaves which support the entire weight of the door on the lower track; a series of teeth on the car below the lower edge of the door; and a reciprocating locking bar and dog carried by the said door and normally under the action of gravity engaging the teeth below the door and locking the same in any desired position on the lower track; in substance as set forth.

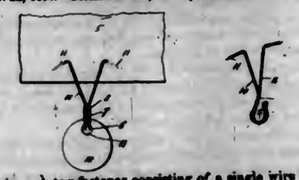


608,363. GOVERNOR. A BERTELL IRELAND, Greene, N. Y. Filed Nov. 11, 1897. Serial No. 658,131. (No model.)

Claim.—1. In a governor, a shell having a flange 4, and provided with a central boss by means of which the shell is secured to the driving-shaft, a governor bar secured upon the end of the driving-shaft, and two pivoted weighted levers pivoted upon the rabbeted ends of the governor-bar, and the two spiral springs 17 having their inner ends secured to the governor-bar, and their outer ends attached to the weighted levers at a short distance beyond their pivotal points, combined with the brackets pivoted upon the outer edges of the levers, also beyond the pivotal points, and the shoes which are secured to the brackets, and which shoes are moved outwardly in contact with the flange 4, of the shell when the levers are moved outwardly, substantially as shown and described.

2. In a governor, a shell provided with the flange 4, and a central boss 5, a driving-shaft to which the shell is secured by means of the boss, a governor-bar secured upon the end of the shaft, and which bar has rabbeted ends and stop-shoulders to limit the movement of the levers, and is provided with ears 17; and the two curved weighted levers 9 which are pivoted upon the outer ends of the bars, and which are adapted to strike against said stop-shoulders, and which levers are provided with ears or hooks 16, combined with the two springs 18, one of which is secured to each of the levers, a suitable adjusting device for each spring, a rod 20 for connecting the short end of one of the levers with the long end of the other, the two brackets 13 pivoted upon the levers, and the shoes 12 secured in said brackets, substantially as shown and described.

608,364. BOTTLE-STOPPER. PHILIP LINDENSTEIN, Baltimore, Md., assignor to the Monarch Manufacturing Company of Baltimore City. Filed Dec. 18, 1897. Serial No. 662,501. (No model.)



Claim.—1. In combination a bottle provided with a groove having a vertical wall outside the circumference of the neck, a cap having a flange extended below the mouth and laterally embracing the bottle-neck on its exterior, said flange being provided with fingers sprung into the groove and having their outer ends bearing against the outer vertical wall of the same and their inner ends against the opposite wall of the groove, substantially as described.

2. In combination a bottle provided with a groove having a vertical wall outside the circumference of the neck, a cap having a flange extended below the mouth and laterally embracing the bottle-neck on its exterior, said flange being provided with fingers sprung into the groove and having their outer ends bearing against the outer vertical wall of the same and their inner ends against the opposite wall of the groove, and a packing covering the mouth of the bottle substantially as described.

3. In combination a bottle provided with a groove having a vertical wall outside the circumference of the neck, a cap having a flange extended below the mouth and laterally embracing the bottle-neck on its exterior, said flange being provided with fingers sprung into the groove and having their outer ends bearing against the outer vertical wall of the same and their inner ends against the opposite wall of the groove, said groove being formed in a wire secured to the bottle-neck, substantially as described.

4. In combination a bottle provided with a groove having a vertical wall outside the circumference of the neck, a cap having a flange extended below the mouth and laterally embracing the bottle-neck on its exterior, said flange being provided with fingers sprung into the groove and having their outer ends bearing against the outer vertical wall of the same and their inner ends against the opposite wall of the groove, and a stripping-wire, substantially as described.

608,365. TAG-FASTENER. JOSEPH B. RICHARDS, Thomson, Ga., assignor of one-half to Louis Emil Steinmann, New York, N. Y. Filed Mar. 22, 1897. Serial No. 628,093. (No model.)

Claim.—A tag-fastener consisting of a single wire bent upon itself midway of its length to form two legs, the resultant double end being bent upon itself to form a hook having an outturned extremity, one of the legs being bent outwardly midway of the termini of the hook portion whereby it may be crossed over the other leg and will play laterally through the mouth of the hook, the extremities of the legs being bent in opposite directions in the planes of their respective movements when crossed.

608,366. HOSE-COUPLING. PETER RIEHL, Jr., Pittsburg, Pa. Filed Oct. 16, 1897. Serial No. 655,362. (No model.)

Claim.—1. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, and a spring-bail secured to the other connection and releasably engaging said lever, substantially as set forth.

2. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, a spring-bail secured to the other connection and releasably engaging said lever, said bail having its looped end bent at an angle to the main portion thereof, substantially as set forth.

3. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, a spring-bail secured to the other connection and releasably engaging said lever, said bail having its looped end bent at right angles to the main portion thereof, substantially as set forth.

4. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, said lever having a recess formed therein, a spring-bail secured to the other connection and engaging said recess in said lever, said bail having its looped end bent at an angle to the main portion thereof, substantially as set forth.

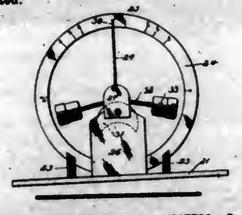
5. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, a spring-bail, a swivel-ring on the other connection, said bail having its ends secured to said ring, said spring-bail being releasably connected at its looped end to said lever, substantially as set forth.

6. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, a spring-bail having hooks formed on its ends, a swivel-ring on the other connection, projections on said ring with which said hooks engage, said spring-bail being releasably connected at its looped end to said lever, substantially as set forth.

7. In a hose-coupling, the combination with the tubular connections, of a lever pivoted to one of said connections, a swivel-ring on the other connection, and a connecting member between said lever and said ring adapted to engage said ring and hold said connections together, substantially as set forth.

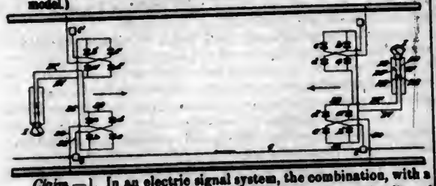
608,367. SHANK FOR BOOTS OR SHOES. WATSON H. SPRAGUE, Greenwich, N. Y., assignor to Sprague & Co., Middle Falls, N. Y. Filed June 14, 1897. Serial No. 640,673. (No model.)

Claim.—1. The combination with a shank for boots, shoes, &c., of a stiffener composed of a metallic strip having a portion folded to embrace the sides of the shank and clenched thereon to retain the stiffener in place, substantially as set forth.



2. The combination with a shank for boots and shoes having a notch in one end, of a stiffener composed of a metallic strip having a portion folded to embrace the sides of the shank and clenched thereon and fitted in the said notch, substantially as set forth.

3. In combination, a shank having a notch in its heel, and a stiffener composed of a metallic strip concavo-convex in transverse section doubled upon itself and clenched upon the opposite sides of the shank, and having the folded end entering the aforesaid notch, substantially as set forth.



608,368. PLUMB-LEVEL. FRANK C. VREDENBURGH and CHARLES F. LATHROP, Atlantic, Iowa. Filed Mar. 1, 1897. Serial No. 625,444. (No model.)

Claim.—A plumb-level, comprising a suitable stock having a con-

tral opening, a plate 21 detachably secured to the stock within its central opening, two uprights 23 having their upper ends bifurcated, a circular scale rim mounted in said bifurcated ends, a support 26 secured to the plate 21 and extending upwardly on both sides of the scale-rim and having openings therein arranged concentrically with the rim, plates 27 covering said openings, a journal mounted in said openings, an indicating-arm 29 fixed to the said journal, wings 30 attached to the upper end of the indicating-arm and overlapping the rim, a weight 26 attached to the lower end of the indicating-arm, two screw-threaded rods 32 fixed to the indicating-arm and extending downwardly at an angle relative thereto, and internally-screw-threaded weights 33 designed to be screwed on the said rods 32, all arranged and combined to operate in the manner set forth and for the purposes stated.

608,869. ELECTRIC SIGNAL SYSTEM. LOUIS C. WERNER, Broad Brook, Conn. Filed June 12, 1897. Serial No. 640,436. (No model.)

Claim.—1. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a vehicle movable along said track; a source of electric energy; an electrical pole-changing switch connected to send current in either direction through the indicator on said vehicle; circuit-controlling means between the source of energy and the two sides of the indicator; a traveling current-collector carried by said vehicle and adapted to make contact with said conductor; means for closing the circuit between the conductor and the track at a point distant from the vehicle; and a visual electrical indicator carried by said vehicle and in circuit with said current collector and responsive to every variation in the length, and hence in the resistance, of the conductor between said vehicle and such distant point, within the range of the indicator, and having an indicator-hand movable at either side of a normal, idle, central position, in accordance with the direction of movement of the vehicle, and adapted to indicate every variation in the distance between the vehicle and such distant point, as the former approaches the latter, and also to show changes in the direction of movement of the vehicle.

2. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; vehicles movable along said track; traveling current-collectors carried by said vehicles and adapted to make contact with said conductor; a source of electric energy for each vehicle; electrical pole-changing switches connected to send current in either direction through the indicators on said respective vehicles; circuit-controlling means between the source of energy and the two sides of the indicator on each vehicle; and visual electrical indicators carried by said vehicles and in circuit, respectively, with said current-collectors and responsive to every variation in the length, and hence in the resistance, of the conductor between said vehicles, within the range of such indicators, and each having an indicator-hand movable at either side of a normal, idle, central position, in accordance with the direction of movement of the vehicle and adapted to indicate every variation in the distance between said vehicles and also to show changes in the direction of movement of each vehicle.

3. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; vehicles movable along such track; automatically-reversible traveling current-collectors carried by said vehicles and adapted to make traveling contact with said conductor and automatically reversible by the reversal of the movements of said vehicles; a source of electric energy connected to send current in either direction through the indicators on said respective vehicles; visual electrical indicators carried by said vehicles and in circuit, respectively, with said current-collectors and adapted to indicate the direction of movement of said vehicles; and pole-changing switches carried by said current-collectors and controlling the circuits through the indicators.

4. The combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a source of electric energy; a vehicle movable along said track; and a current-collector automatically reversible, while in contact with said conductor, by the reversal of the movement of the vehicle, and comprising a carrier-arm pivotally connected with the vehicle, and a triangular sliding contact-shoe pivoted to said carrier-arm and reversible, on the reversal of the movements of the vehicle, to bring its different sides into engagement with the conductor.

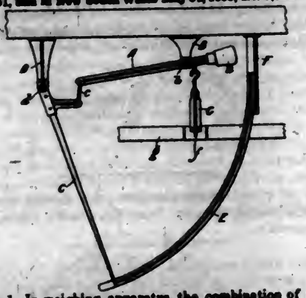
5. The combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a source of electric energy; a vehicle movable along said track; a spring-pressed carrier pivotally connected with the vehicle; and an automatically-reversible current-collector trailing at an acute angle to the conductor while in contact therewith, and reversible to an opposite trailing position, while in contact with said conductor, by the reversal of the movement of the vehicle, and comprising a spring-pressed carrier-arm pivotally secured to said carrier and a contact-maker pivoted to said carrier-arm and movable therewith toward and from the vehicle and said conductor.

6. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a vehicle movable along such track; a signaling device on said vehicle; a source of electric energy connected to send current in either direction through said signaling device; an automatically-reversible traveling current-collector carried by, and controlled by the reversal of the movement of, said vehicle and adapted to make traveling contact with said conductor; and an automatic pole-changing switch controlled by the current-collector and controlling the direction of flow of the current through said signaling device.

7. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a vehicle movable along such track; a signaling device on said vehicle; a source of electric energy connected to send current in either direction through said signaling device; an automatically-reversible traveling current-collector carried by, and controlled by the reversal of the movement of, said vehicle and adapted to make traveling contact with said conductor; and an automatic pole-changing switch carried by, and reversible with, the current-collector and controlling the direction of flow of the current through said signaling device.

8. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a traveling current-collector carried by said vehicle and adapted to make traveling contact with said conductor; means for closing the circuit between the conductor and the track at a point distant from the vehicle; a source of electric energy; a pair of relays connected in a normally-closed local circuit with the source of energy, and also connected with opposite sides of the main circuit, and oppositely operative, on the passage of a current through either side of the main line, to send current in a corresponding direction through the indicator on the vehicle; circuit-controlling means between the source of energy and the relays; and a visual electrical indicator carried by said vehicle and in circuit with said current-collector and adapted to indicate variations in the distance between the vehicle and such point.

608,870. SLIDE-RULE. JAMES R. C. YALDEN, New York, N. Y. Filed Mar. 2, 1896. Serial No. 672,265. (No model.)



Claim.—1. A slide-rule provided with two helices carrying scales, the threads of one helix being revoluble between the threads of the other helix, substantially as specified.

2. A slide-rule provided with two cylindrically-wound helices of like pitch carrying scales, the threads of one helix being revoluble between the threads of the other helix, so that one helix is movable along the other, substantially as specified.

3. A slide-rule composed of a transparent tube provided with a helical scale, and of a cylindrical core movable longitudinally within the tube and provided with a helical scale of like pitch, the threads of one helix being revoluble between the threads of the other helix, substantially as specified.

608,871. AUTOMATIC WEIGHING APPARATUS. CHARLES ARMSTRONG, Christchurch, New Zealand. Filed Sept. 2, 1896. Serial No. 604,773. (No model.) Patented in New Zealand Feb. 7, 1895, No. 7,414; in England May 4, 1895, No. 8,080; in Victoria May 20, 1895, No. 12,231, and in New South Wales May 31, 1895, No. 6,894.

Claim.—1. In weighing apparatus, the combination of a track having a movable section, a rock-shaft at right angles to the track provided at one end with an arm projecting from one side thereof and at its opposite end with a lever projecting from the opposite side thereof, a connection between the arm and the movable track-section, a pivoted pointer, connections intermediate the projecting lever and the pointer, and a curved dial-plate adapted to be traversed by the pointer, substantially as described.

2. In weighing apparatus, the combination of a track having a movable section, a rock-shaft at right angles to the track provided at one end with an arm projecting from one side thereof and at its opposite end with a lever projecting from the opposite side thereof, a connection between the arm and movable track-section, a pointer pivoted at its end and having an arm, centering devices for the pointer, a link connecting the projecting lever and the arm of the pointer, and a dial-plate adapted to be traversed by the pointer, substantially as described.

3. In weighing apparatus, the combination of a track having a movable section, a rock-shaft at right angles to the track provided with V-shaped ends and having an arm near one end and a projecting lever near its opposite end, said arm and lever projecting from opposite sides of the rock-shaft, a connection between the arm and the movable track-section, a pointer pivoted at its end between centering devices and having an arm, a link connecting the arm and the projecting lever and a dial-plate adapted to be traversed by the pointer, substantially as described.

608,872. RAILWAY-SWITCH. WILLIAM C AYERS, Plymouth, N. C. Filed Sept. 9, 1897. Serial No. 651,202. (No model.)

Claim.—1. The combination with the pivoted switch-throwing disk, of train-operated switch-throwing levers at opposite sides of the switch and connected with said disk for turning it in opposite directions, a bolt for locking the disk, and train-operated bolt-operating levers adjacent to said switch-throwing levers; whereby the disk will first be unlocked and then turned to throw the switch, substantially as set forth

2. The combination with the pivoted switch-throwing disk, of centrally-pivoted horizontal switch-throwing levers at opposite sides of the switch and connected to the disk for turning it in opposite directions, a bolt for locking said disk, bolt-operating levers under both ends of said switch-throwing levers, crank-shafts under said bolt-operating levers, and rods connecting said crank-shafts with the bolt or locking mechanism, substantially as set forth.

3. The combination with the notched switch-throwing disk, of a bolt for engaging either disk-notch, a cam-slide for operating the bolt from either direction, and springs engaging the ends of the bolt-operating slide and holding it in its normal position, substantially as set forth.

4. The combination with the switch-throwing disk having locking-notches, of the bolt for engaging said notches, and provided with a transverse slot, c', having flaring ends forming V-shaped lugs, c^2 c^3, the train-operated slide, F, passed through said slot and having a notch, f^2, receiving lug, c^2, and notches, f^3, for lug, c^3, and springs for holding the slide in its normal position, substantially as set forth.

5. In a train-operated switch mechanism, a centrally-pivoted switch-actuating lever formed of a transmitting member having a longitudinal slot, an operating member extending through said slot for operation at either end by the train devices, and springs centering the operating member within the transmitting member, substantially as set forth.

6. The combination with a lever-box having parallel longitudinal channels open from end to end for the passage of the train rods or devices, of a transverse centrally-pivoted two-part lever, the members of which have a yielding or spring connection; the ends of the transmitting-lever member projecting into said channel, a rock-shaft within the box and having cranks within said channels and an end transmitting-crank, and levers formed of two members pivoted together above the said cranks and at their ends pivoted in the ends of the box-channels, substantially as set forth.

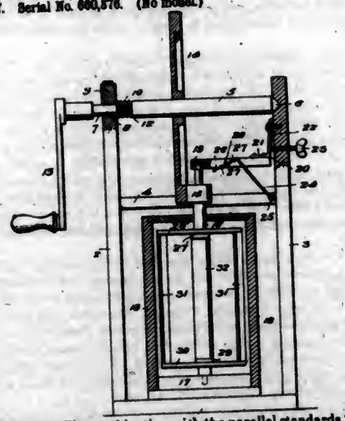
7. The combination with the box and centrally-pivoted notched switch-throwing disk, D, having a pin, D', extending through a curved slot in the box-bottom, of a bolt, E, for engaging the disk-notches, and a longitudinal bolt-operating slide, F, having springs bearing on its ends, substantially as set forth.

8. The combination with the rock-shaft having a hand-lever and cross-head, means for locking said lever, and rods depending from the ends of the cross-head and extending down adjacent to the road bed, of a switch throwing disk provided with a locking mechanism, lever-boxes beyond and at opposite sides of the switch-operating disk, and each having a pair of parallel channels for the lower ends of said rods, centrally-pivoted levers in the lever-boxes with their ends projecting into said channels, rods connecting the levers at opposite sides of their pivots with the disk at opposite sides of its pivot, longitudinally-extending lock-operating levers within the said channels, crank-shafts having an operating-crank under every lock-operating lever, and a transmitting-crank connected to the ends of the lock or bolt operating device, substantially as set forth.

608,873. HOOK AND BUSHING FOR SAME. JOSHUA W. GARNER, Fort Worth, Tex., assignor to Sabina J. Carder, same place. Filed Jan. 2, 1897. Serial No. 617,755. (No model.)

Claim.—1. A bushing for hame-hooks consisting of a solid body portion having heads on both ends thereof, said heads having bearings for chain-links, said bushing being adapted to repair hame-hooks partly worn by the friction of chain-links.

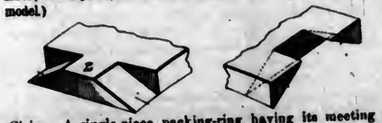
2. The combination of a hook provided with an eye at the bearing-point and the bushing comprising a solid piece of metal which is provided with a head on each end thereof and which is fitted in said eye.



608,874. PNEUMATIC TIRE. CLARA COLLA, Beaconwood Burnt Green, England. Filed Dec. 16, 1896. Serial No. 615,986. (No model.)

Claim.—In combination, the rim, the wires C extending about the edges thereof with a space between said edges and wires, the balls having the flanges projecting laterally in relation to the rim.

and through the circumferential space between the rim edge and the wire, and the cross-wires D extending between the balls over the rails or wires C and having their ends bent down and under the edges of the rims, substantially as described.

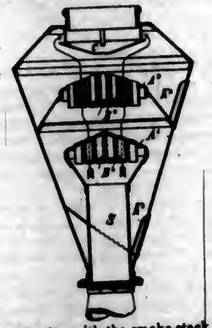


608,875. CHURN. JAMES P. DUNN, Hadley, Ga. Filed Dec. 6, 1897. Serial No. 660,576. (No model.)

Claim.—1. The combination with the parallel standards 2 and 3, the driving-shaft 5 journaled therein, and the friction-disk 14 fixed on said shaft, of the dasher-shaft, the friction-hub fixed on said shaft so as to bear against the face of the friction-disk and the bracket 19 hinged to the standard 3 and forming a bearing for the upper end of said dasher-shaft and means for longitudinally adjusting said bracket, as and for the purpose set forth.

2. The combination with the standards 2 and 3, the latter being formed with a conical thrust-bearing, the driving-shaft 5 journaled in said standards, its inner end being formed with a conical thrust-journal 6, the spring 10 encompassing said shaft between its shoulder 12 and the inner face of the standard 2, and the friction driving-disk 14 fixed to said shaft, the horizontal bracket 19 adjustably hinged to the inner face of the standard 3 and provided at its under face with a conical bearing, the dasher-shaft 16 provided at its upper end with a corresponding conical thrust-bearing, the hub 15 fixed to said dasher-shaft and the thumb-screw 23 adjustably secured in the standard 3 and adapted to adjust the dasher-shaft with reference to said driving-disk 14, substantially as shown and described.

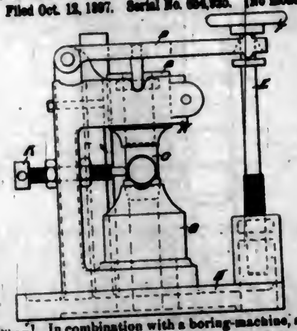
608,876. PACKING-RING. SAMUEL F. FIELD and WILLIAM T. HECK, Findlay, Ohio. Filed Sept. 27, 1897. Serial No. 653,180. (No model.)



Claim.—A single-piece packing-ring having its meeting ends united by a double beveled joint, one end of said ring being provided with a protruding lug having the transverse bevels on opposite sides of the flat central face thereof, and the other end of the ring having a central notch and the under bevels lying on opposite sides of the notch and inclined reversely to each other; said ring having its ends joined together by the lug fitting in the recess and with the beveled faces in contact with each other, and the inner and outer faces of the ring lying flush at the joint, substantially as described.

608,877. RATCHET-WHEEL WRENCH. JOHN H. FITCH, Wesley, Mich. Filed Nov. 12, 1897. Serial No. 658,236. (No model.)

Claim.—The combination with the handle having at one end two concentric rings and a transversely-elongated socket, a head journaled in said rings and provided with ratchet-teeth, a dog pivoted to said handle and provided with two operating-toes and provided with a lug having a reduced stem, a pin having a rounded head seated in said transversely-elongated socket and a coil-spring having its upper end embracing the reduced stem and abutting against the lug, and having its lower end embracing the pin and abutting against the head of the same, substantially as shown and described.



608,878. SPARK-CATCHER. PAUL HAGEMANN and HEINRICH PAHLER, Stettin, Germany. Filed Feb. 25, 1897. Serial No. 625,066. (No model.)

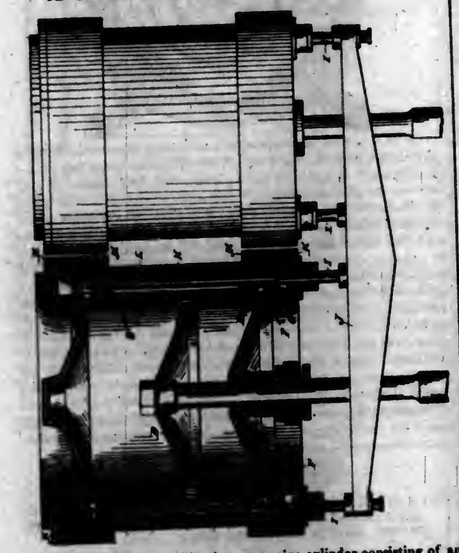
Claim.—In combination with the smoke-stack of inverted-cone shape, the pipe S extending up within the same and having an enlarged closed hood, a series of pipe-sections passing through the hood and forming a plurality of discharge-openings equaling in total area the area of the pipe S, the partition above said hood having a plurality of pipe sections arranged out of line with the lower pipe-sections, the contracted opening in the upper end of the stack and the deflector-plate beneath the same, substantially as described.

608,879. JIG FOR SECURING CYCLE PARTS, &c., WHILE BEING BORED OR MACHINED. FREDERICK J. T. HASKEW, Stourbridge, England. Filed Oct. 12, 1897. Serial No. 654,925. (No model.)

Claim.—1. In combination with a boring-machine, a sliding bush engaging the work to be machined, an operating-lever, and a seat-block below the said bush, substantially as described.

2. In combination, the standard, the bush movable through the same to engage the work, and a mandrel arranged to one side of the standard and projecting toward the same to receive the work upon its end and to hold it in line with the bush, substantially as described.

3. In combination, the standard, the sliding bush with operating-lever, the seat-block below the said bush and a sliding locating and steadying plug mounted on an adjustable holder and bracket, substantially as described.



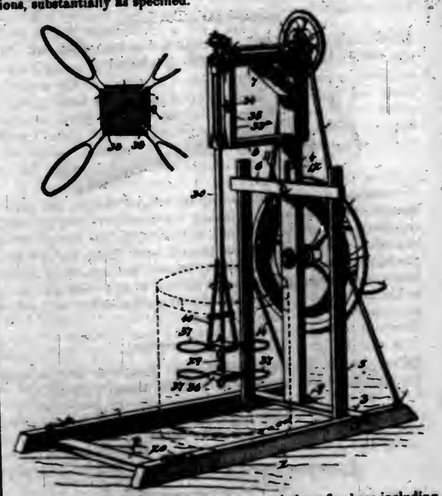
4. In combination, the standard, the hollow bush for engaging the work arranged in said standard, a seat-block below the bush and a mandrel arranged to one side of the standard and projecting laterally in between the seat-block and bush to hold the work, substantially as described.

5. In combination, the standard, the bush for holding the work arranged in said standard, the boss a projecting laterally from the standard and the mandrel adjustably secured to the face of said boss and projecting laterally with relation to the standard and having its inner end below the bush to hold the work in the line of boring, substantially as described.

6. In combination, the standard, the bush in said standard to hold the work, the mandrel to one side of the standard and projecting laterally with relation to the same with its end below the bush to form a support for the work and a steadying-plug arranged on the opposite side from the mandrel and projecting laterally in relation to the standard to engage the work, substantially as described.

7. In combination, the standard, the means therein for holding the work including the movable bush, and a steadying-plug projecting laterally with relation to the standard with its inner end in a position to engage the work, and a bracket for supporting the steadying-plug, said bracket being vertically adjustable to the standard while the plug is laterally adjustable in the bracket, substantially as described.

608,880. ENGINE-VALVE. ALEXANDER G. HAY, Philadelphia, Pa. Filed June 21, 1897. Serial No. 641,736. (No model.)



Claim.—1. In combination, an engine-cylinder consisting of an outer casing, and an inner lining so arranged that a space is formed between them, bearings formed at each end of said members, and a valve composed of two sections each section consisting of two plates adapted to fit in the space between the cylinder and lining, and a packing-ring between the plates and a bolt and nut for adjusting the packing-ring, as and for the purpose described.

2. In combination, a cylinder having two outwardly-projecting flanges at its ends forming a space between them serving as an induction-passage, a lining concentric with the cylinder and at such a distance therefrom as to leave a space, bearings formed on the inner flange and at the ends of the lining, valves composed of two sections each section consisting of two annular plates placed one above the other in the space between the bearings, packing-rings placed between the plates and a nut and bolt for adjusting the packing-rings, and rods connecting the sections, as and for the purpose described.

608,881. CHURN. FLAVIUS J. HOSS, Birchwood, Tenn. Filed July 9, 1897. Serial No. 643,991. (No model.)

Claim.—1. A churn-power having a frame consisting of a base including parallel side bars, a standard hingedly connected to the base at a point between the side bars of the base and adapted to fold therebetween, a brace-frame pivotally mounted upon the side bars of the base to fold therebetween, and having a sliding connection with the standard, said brace-frame being mounted eccentrically with relation to the hinge of the standard, and means for clamping the standard and brace-frame together, to secure them in their desired relative positions, substantially as specified.

2. A churn-power having a frame consisting of a base including parallel side bars, a standard having a detachable hinged connection with the base, between said side bars, and adapted to fold in the plane thereof, a brace-frame having side bars pivotally connected to the side bars of the base to fold therebetween, and having a cross bar provided with a guide-pin operating in a slot of the standard, and a clamping device consisting of a thumb-nut engaging said guide-pin to clamp the brace-frame and standard in the desired relative positions, substantially as specified.

3. A churn-power having a frame consisting of a base including parallel side bars, a standard hingedly connected with the base between said side bars, and adapted to fold in a plane therewith, a brace-frame having side bars pivotally mounted on the inner sides of the side bars of the base, and connected by a cross-bar having a sliding connection with the standard, and brace-rods for securing the brace-frame in its upright position, substantially as specified.

4. A churn-power having a supporting-frame, including a folding standard and means for securing the same in its upright position, operating mechanism including a driving-shaft, a driving-wheel, and a belt connection between the driving shaft and wheel, a sectional bearing on the frame having a movable member, and means for securing the same in its operative position, and dashers having concentric spindles mounted in said sectional bearing and provided with gears meshing with a gear on the driving-shaft, whereby the dashers and spindles may be dismounted for removal from the churn-receptacle preparatory to folding the frame, substantially as specified.

5. A churn mechanism having concentric dasher staffs or spindles and means for rotating the same, dashers, of which one is secured to the inner dasher staff or spindle, said dashers having body portions or collars and wings or blades, arms carried by the tubular dasher staff or spindle, and provided with interned lower extremities to engage sockets in opposite sides of the body portion or collar of its dasher, and a slide-ring fitted upon said arms for normally maintaining their interned extremities in engagement with a dasher, substantially as specified.

6. A churn mechanism having concentric dasher staffs or spindles and connected dashers, and means for communicating rotary motion to the dasher staffs or spindles, one of the dashers having a collar removably fitted upon the inner dasher staff or spindle, and provided with locking devices to secure it thereon, and the other dasher being secured to the tubular dasher staff or spindle by means of arms, carried by the latter and provided with interned lower extremities forming studs to engage sockets in the body portion of said dasher, and a ring fitted to slide upon said arms normally maintain the interned extremities or studs in engagement with said sockets, substantially as specified.

7. The combination with a dasher-spindle, and a dasher having its body portion provided with opposite sockets, spring-arms carried by the dasher-staff and having interned extremities forming studs to engage said sockets in the body portion of the dasher, said spring-arms having an outward tendency adapted to remove their studs from the sockets of the dasher, and a sliding ring mounted upon the arms and adapted, when moved in one direction, to contract the arms to cause engagement of their studs with said sockets, substantially as specified.

8. A churn mechanism having concentric dasher staffs or spindles, and means for rotating the same, dashers, of which one is secured to the inner dasher staff or spindle and the other of which is loosely mounted upon said spindle, said dashers having body portions or collars and attached wings or blades, radially-swinging arms carried by the tubular dasher staff or spindle and terminally having a pin-and-socket connection with the collar of the loosely-mounted dasher, and means for maintaining the arms with their extremities in interlocking engagement with said loosely-mounted dasher, substantially as specified.

603,882. TOY GUN. WILLIAM H. HOLLOWAY, Brazil, Ind. Filed Aug. 17, 1897. Serial No. 648,556. (No model.)

Claim.—A toy gun comprising the integral barrel 1, and stock 2, formed with the orifice 5, guide-slot 4, and notch 11, and the retaining-spring 15, fixed in said stock and having its free end projecting into the breech-chamber, in combination with the spring 6, fixed to the butt of said stock, and having its free end extending through said guide-slot, and the trigger 13 pivoted to said stock and having its free end projecting across the path of the free end of the spring 6, substantially as shown and described.

603,883. ELECTRIC-ARC LAMP. ALFRED W. KNUTSON, Galesburg, Ill. Filed Apr. 30, 1897. Serial No. 634,584. (No model.)

Claim.—1. A clutch for electric-arc lamps having a clutch-arm formed with an obliquely-disposed rod-opening piercing one side of the arm to permit of the carbon rod passing laterally into said opening, one of the inclined walls of said opening being provided with a clutch-notch.

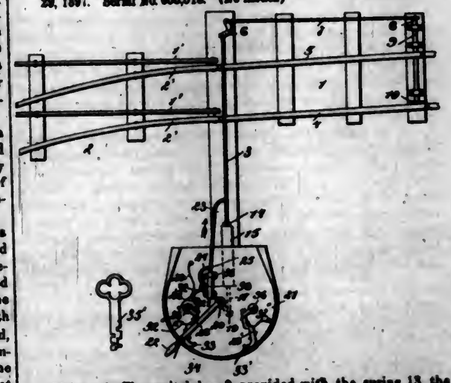
2. A clutch for electric-arc lamps having a clutch-arm provided with a rod-opening, and a movable auxiliary grip-jaw supported on said arm and normally moved in an inward direction, substantially as set forth.

3. A clutch for electric-arc lamps, having a clutch-arm provided with a rod-opening therein, and a movable auxiliary grip-jaw supported on said arm at one side of the opening therein and provided with a head portion normally moved in an inward direction.

4. A clutch of the class described, comprising a hanger-bar, and a clutch-arm pivotally hung from said bar and provided with a clutch-collar having an obliquely-disposed rod-opening piercing one side thereof, said rod-opening being formed with opposite inclined side walls, the inner of which walls is formed in its upper edge with a V-shaped clutch-notch, and the outer wall being formed at its lower edge in a plane below such notch with a curved contact-cavity, substantially as set forth.

5. A clutch of the class described comprising a hanger-bar, a clutch-arm pivotally hung from said bar and provided at its free end with a clutch-collar having a rod-opening therein, and an auxiliary grip-jaw pivotally supported on said collar at the outer side thereof and provided with an inner forked head normally moved in an inward direction, substantially as set forth.

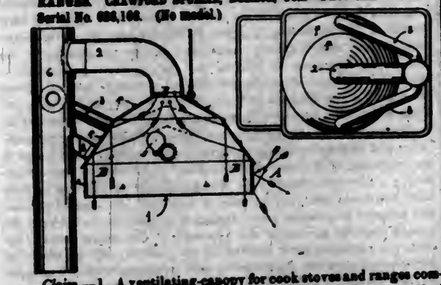
6. A clutch of the class described, comprising a hanger-bar, a clutch-arm pivotally hung from said bar and provided at its free end with a clutch-collar, an auxiliary grip-jaw pivotally supported between its ends on said collar at the outer side thereof and provided with an inner forked head, an adjusting-rod slidably mounted at one side of the clutch-arm and loosely connected at its outer end with one extremity of said grip-jaw, a collar adjustably fitted on said rod, a link pivotally suspended from the clutch-arm and pivotally connected with said collar, and a spring connected at one end with the link and at its other end with the clutch-arm, substantially as set forth.



603,884. STEAM-ENGINE. CHARLES A. MAURER, Cedar Bluff, Iowa. Filed Feb. 1, 1897. Serial No. 621,491. (No model.)

Claim.—1. In a rotary engine, the combination of a cylinder, a piston operating in the cylinder, means for admitting and exhausting a motive medium from the cylinder, brackets independent of each other and the cylinder and having the shaft of the piston journaled therein, foot-bars extending parallel with each other and the shaft of the piston and connecting the lower ends of the brackets, and provided with longitudinal slots, and feet secured to the sides of the cylinder and having their outer ends tenoned and secured in the slots of the foot-bars, and having shoulders above and below the tenons to engage with the inner sides of the foot-bars, substantially as shown and described.

2. A rotary engine constructed substantially as set forth, the same comprising a piston having a rib midway of its sides projecting beyond its peripheral surface, and having a corresponding number of similarly-formed pockets alternately disposed upon opposite sides of the rib, whereby the portions between the pockets upon one side of the rib come opposite and in transverse alinement with the pockets upon the other side of the said rib, the ends of the pockets being curved in opposite directions, forming shoulders or abutments, a cylinder composedof parts comprising heads having inner rims formed with a groove between their meeting portions to receive the aforesaid rib, and having oppositely-disposed inlet-ports and a chamber at its lowest point forming a common exhaust-port, and having chambers in advance of the inlet-ports with their inner ends inversely curved to the curved ends of the pockets, each port communicating with the cylinder upon opposite sides of the said groove and rib to supply the motive medium to the two sets of pockets, concentric grooves and ribs between the ends of the piston and the heads of the cylinder, and means for controlling the admission of steam to either of the inlet-ports, substantially as and for the purpose set forth.



603,885. AUTOMATIC SWITCH-LOCK FOR RAILWAYS. WILLIAM A. SLOCUM, Lansing, Mich. Filed July 20, 1896. Renewed Sept. 29, 1897. Serial No. 653,513. (No model.)

Claim.—1. The switch-bar 3 provided with the spring 13, the tube 15, and the rod 17 connected to the crank 19 secured to the switch-shaft 20 mounted in the switch-stand 21, and provided with a switch-lever 22 having a stud 34, in combination with the spring-bolts 28 28', having integral curved arms 33, 33', substantially as shown and described.

2. An automatic railway-switch comprising the switch-bar 3, the spring 13 mounted on one end of said bar; a tube incasing said spring and connected to the crank 19 on the shaft 20, having a lever 22 provided with a stud 34, the spring-bolt 28 having the curved arm 33, the beveled head 27, the arm 23 rigidly secured to the switch-bar 3 and provided with the pivoted trigger 24 and lug 30, adapted to travel over the path of the stationary lug 31, in combination with the bell-crank lever 6, one arm of which is secured to the switch-bar and the other arm pivoted to one end of a connecting-rod 7, the transverse shaft 9, provided with the lever 10, arranged contiguous to one of the rails of the main track, and having a crank 8, the outer end of which is pivoted to the opposite end of said rod 7, substantially as shown and described.

603,886. VENTILATING-CANOPY FOR COOK STOVES OR RANGES. CRAWFORD STUBLIN, Denton, Tex. Filed Mar. 18, 1897. Serial No. 628,168. (No model.)

Claim.—1. A ventilating-canopy for cook stoves and ranges composed of a dome built with intersecting surfaces and of a vertical flange fitted around the lower part of the dome; such dome being directly connected with the smoke pipe or flue of the stove or range by an upper pipe 2 and lower side pipes 3 leading from the dome to the smoke pipe or flue of the stove or range; substantially as described and for the purposes set forth.

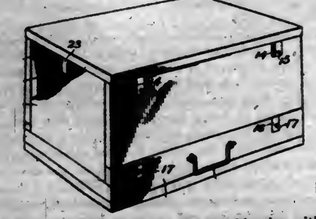
2. In a ventilating-canopy for cook stoves and ranges, the combination with the ventilating-pipes connecting the dome with the smoke pipe or flue of the stove or range at top and sides of the canopy of pivotal disks 5 placed at the openings of said connecting pipes inside of the dome and adapted to close them partially or totally to regulate the draft; substantially as described and for the purposes set forth.

603,887. TONGUE-SUPPORT. CHARLES H. SWANK, Linville, Va. Filed Nov. 18, 1897. Serial No. 658,980. (No model.)

Claim.—1. The combination with a tongue, a caster-wheel provided with a standard, and a brace extending from the standard to the tongue, of a tubular housing depending from the tongue and receiving the standard and capable of upward-and-downward movement thereon, said housing being provided on its interior with a horizontal bearing-ridge and being enlarged above and below the same at its back and front to permit the standard to move backward and forward and prevent any lateral movement, and means for confining the tubular housing and the tongue, substantially as described.

2. The combination with a tongue, of a tubular housing depending therefrom, a caster-wheel having a standard arranged within the housing, and a coiled spring interposed between the upper end of the standard and the tongue and arranged within the tubular housing, substantially as described.

3. The combination with a tongue, of a tubular housing having its upper end enlarged and recessed to receive the tongue and arranged against the lower face thereof, a plate engaging the upper face of the tongue and having a recess to receive the same, bolts located at opposite sides of the tongue and passing through the plate and the upper end of the housing, a caster-wheel having a stem arranged within the tubular housing, and a coiled spring interposed between the standard and the tongue and located within the housing, substantially as described.



4. The combination with a tongue, of a tubular housing depending therefrom and having an interior shoulder located between its ends and formed by enlarging the upper portion of the bore or opening, said housing being provided at the lower portion of the bore or opening with an annular bearing-rib and being enlarged above and below the same at its front and back, a standard fitting within the housing and having its upper end reduced, a disk or plate having an enlarged opening to receive the upper end of the standard and detachably connected therewith and adapted to engage the said shoulder, and a coiled spring interposed between the upper end of the standard and the tongue, substantially as described.

5. The combination of a tongue, a caster-wheel provided with a standard, means for connecting the tongue and the standard whereby the tongue will be capable of vertical movement on the standard, an oscillating brace disposed at an inclination in advance of the caster-wheel and having its lower end connected with the standard at the bottom thereof, and an adjustable sleeve arranged at the upper end of the brace and hinged to the tongue, said sleeve being adapted to vary the length of the brace, substantially as described.

6. The combination with a tongue of a caster-wheel having a standard and provided at the bottom thereof with a depending stud, means for mounting the standard on the tongue, an inclined brace having its upper end threaded and provided at its lower end with an eye detachably secured to the depending stud of the standard, a bracket secured to the tongue and provided with depending ears, and a sleeve having an eye detachably hinged to the perforated ears, said sleeve being interiorly threaded and engaging the upper end of the brace, substantially as described.

7. The combination of a tongue, a standard connected therewith and provided with an arm having ratchet-teeth at opposite sides thereof, the adjustable side pieces provided at their upper ends with similar ratchet-teeth and having at their lower ends annular flanges extending inward from the side pieces and forming bearings, a bolt passing through the arm of the standard and the upper ends of the side pieces, arranged centrally and forming a pivot for the same, and a caster-wheel journaled in the bearings between the side pieces, substantially as described.

603,888. SHIPPING-CRATE. ROBERT L. TEMPLEMAN, Tackett's Mills, Va. Filed Aug. 7, 1896. Serial No. 602,002. (No model.)

Claim.—1. In a shipping-crate, the combination with a rectangular bottom piece having side and end strips secured thereto, one of said side strips being slightly higher than the other, of end pieces hinged to said end strips and adapted to fold inwardly, side pieces hinged to said side strips and adapted to fold inwardly, said side pieces and the strips to which they are hinged being unitedly of the same height as said end pieces and the strips to which they are hinged, both of said side pieces being cut away along their inner surfaces adjacent to their outer ends forming shoulders, against which said end pieces are adapted to bear, and having grooves in their inner surfaces adjacent to their vertical centers, a partition hinged to said bottom piece adapted to fit within said grooves when it is in its raised position, and adapted to fold down in close contact with said bottom piece, pins or projections on the outside of said side strips, and of said side pieces, a lid or cover for said crate having guides or stop-pieces at each end, against which the upper ends of said end pieces are adapted to bear, and strips of metal secured to the under side of said lid or cover adjacent to its outer ends having downwardly-projecting flanges thereon with openings therein, into which said pins or projections on said side strips and said side pieces are adapted to fit when said lid or cover is in place, substantially as and for the purpose described.

2. In a shipping-crate, the combination with a rectangular bottom piece having side and end strips secured thereto, one of said side strips being slightly higher than the other, and having a bail or handle pivoted to the outside thereof, of end pieces hinged to said end strips and adapted to fold inwardly, side pieces hinged to said side strips and adapted to fold inwardly, said side pieces and the strips to which they are hinged being unitedly of the same height as said end

Claim.—1. In a rotary engine, the combination of a cylinder, a piston operating in the cylinder, means for admitting and exhausting

and described.

2. An automatic railway-switch comprising the switch-bar 3, the

pieces and the stripe to which they are hinged, both of said side stripe being cut away along their inner surfaces adjacent to their outer ends forming shoulders against which said end pieces are adapted to bear, and having grooves in their inner surfaces adjacent to their longitudinal centers, a partition hinged to said bottom piece adapted to fit within said groove when it is in its raised position and adapted to fold down in close contact with said bottom piece, pins or projections on the outside of said side stripe, staples secured to said side pieces and hooks pivoted to said end pieces, and to said partition, adapted to engage said staples, substantially as and for the purpose described.

603,389. THREAD HOLDER AND CUTTER FOR SPOOLS.

MARY A. L. THOMAS, Springfield, Tenn. Filed May 15, 1897. Serial No. 637,019. (No model.)

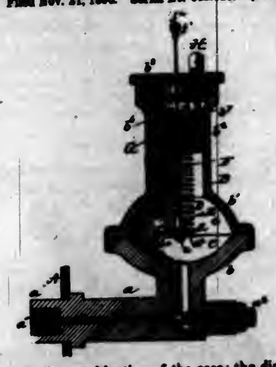
Claim.—1. A thread holder and cutter consisting of a divided clamping-band adapted to engage the end flange of a spool, and provided with a tangential extension formed with a thread holding and cutting surface, substantially as set forth.

2. A thread holder and cutter consisting of a divided clamping-band adapted to engage the end flange of a spool, and provided with a tangential extension formed with a thread-clamping surface, and having an inwardly-projecting cutting-lip, substantially as set forth.

603,390. ELECTRIC SIGNAL SYSTEM.

LOUIS C. WERNER, Broad Brook, Conn. Filed June 17, 1897. Serial No. 641,172. (No model.)

Claim.—1. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a source of electric energy; a train movable along such track; a current-collector carried by said train and adapted to make traveling contact with said conductor; means for closing the circuit between the conductor and the track at a point distant from the train; a visual electrical indicator carried by said train and in circuit with said current-collector and responsive to every variation in the length, and hence in the resistance, of the conductor between said train and such distant point within the range of the indicator, and having an indicator-hand movable at either side of a normal, idle, central position in accordance with the direction of movement of the train, and adapted to indicate every variation in the distance between the train and such point; a reversing-lever carried by the locomotive of the train; and an electrical pole-changing switch controlled by said reversing-lever and adapted to send a current in either direction through the indicator.



2. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a source of electric energy; a train movable along such track; a current-collector carried by said train and adapted to make traveling contact with said conductor; means for closing the circuit between the conductor and the track at a point distant from the train; a visual electrical indicator carried by said train and in circuit with said current collector and responsive to every variation in the length, and hence in the resistance, of the conductor between said train and such distant point within the range of the indicator, and having an indicator-hand movable at either side of a normal, idle, central position in accordance with the direction of movement of the train, and adapted to indicate every variation in the distance between the train and such point; a reversing-lever carried by the locomotive of the train; and an electrical pole-changing switch connected with, and controlled by, the operation of said reversing-lever and adapted to send current in either direction through the indicator.

3. In an electric signal system, the combination, with a track of a line of way, of a conductor extending along the line of way and insulated from said track; a source of electric energy; a train movable along such track; means for closing the circuit between the conductor and the track at a point distant from the train; a visual electrical indicator carried by said train and responsive to every variation in the length, and hence in the resistance, of the conductor between said train and such distant point within the range of the indicator, and having an indicator-hand movable at either side of a normal, idle, central position in accordance with the direction of movement of the train, and adapted to indicate every variation in the distance between the train and such point; a traveling current-collector carried by said train and adapted to make contact with said conductor; a reversing-lever carried by the locomotive of the train; an electrical pole-changing switch controlled by said reversing-lever and adapted to send current in either direction through the indicator; and an automatic spring-released circuit-breaker controlled by the current-collector and controlling the circuit to the indicator.

4. In an electric signal system, the combination, with track-rails and switch-rails of a line of way, of a conductor extending along the line of way and insulated from said rails and having a relatively long section in advance of the switch disconnected from the main portion of the conductor; a source of electric energy; switch-operating means; circuit-closing means controlled by the opening of the switch and operative for closing the circuit between the rails at the switch and such disconnected section; a vehicle movable along the track; a traveling current-collector carried by said vehicle and adapted to make contact with said conductor; a visual electrical indicator carried by said vehicle and in circuit with said current-collector and responsive to every variation in the length, and hence in the resistance, of the conductor between said vehicle and such circuit-closing means within the range of the indicator, and having an indicator-hand movable at either side of a normal, idle, central position and adapted to indicate every variation in the distance between the vehicle and the switch on the approach of the former toward the latter; a reversing-lever carried by the vehicle; and an electrical pole-changing switch controlled by said reversing-lever and adapted to send current in either direction through the indicator.

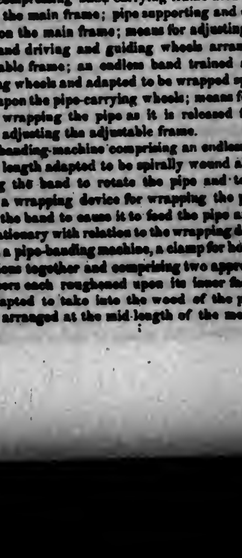
603,391. PRESSURE-RECORDER.

FRANK L. WOLFE, Medford, Mass., assignor to the Crosby Steam Gage and Valve Company, Boston, Mass. Filed Nov. 21, 1896. Serial No. 612,923. (No model.)

Claim.—1. The combination of the case; the diaphragm within it; the spring secured to one end of the diaphragm; the hollow plug in which the upper end of the spring is secured and means for raising and lowering said plug without opening the case or separating the parts, as set forth.

2. The combination of the case, B; the diaphragm, C, within it; the spring, D; the plug, G; the spring being secured to the diaphragm and plug; and the regulating-screw, H, as set forth.

3. The combination of the pencil-lever with the post, L; the hollow screw-plug, *l*; the check-nut, l^3; and the head of the case, B, as set forth.



603,392. WOODEN-PIPE-BANDING MACHINE.

WALTER J. WOODWARD, National City, Cal., assignor to Hattie I. Woodward, same place, and D. P. H. Little, C. W. Sanders, and Emma A. Harrington, Los Angeles, Cal. Filed Feb. 16, 1897. Serial No. 623,541. (No model.)

Claim.—1. In a pipe-banding machine, the combination of means for removably securing together, axially, end to end, independent sections of pipe; means for compressing and rotating the pipe thus secured together; means for applying a continuous band to the compressed pipe; and means for maintaining a tension on the band.

2. A pipe-machine comprising a frame; an endless band adapted to have a portion of its length wound spirally around a length of pipe; guide-wheels for the band; a tension for the band; a bearing-wheel adapted to support the pipe against the pull of the band;

means for driving the band; and a wrapping device adapted to wrap the pipe as it is released from the band.

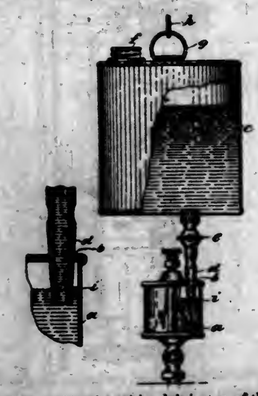
3. In a banding-machine, the combination set forth of a frame; an endless band adapted to be wound spirally around a pipe; suitable guiding-wheels for the band; a bearing-wheel adapted to take the pull of the band; a tension for holding the band taut; means for driving the band; and a wrapping device adapted to wrap the pipe with a permanent wrapping as it is released from the band.

4. In a pipe-banding machine, the combination set forth of a main frame; pipe guiding and supporting wheels arranged upon the main frame; band driving and guiding wheels secured in the frame at one side of the pipe guiding and supporting wheels; a compression and driving band trained around the guiding and supporting wheels, and adapted to be wound spirally around a pipe arranged upon the supporting and guiding wheels; a tension device adapted to hold the band taut; and a wire-wrapping device adapted to wrap the pipe as it is released from the spiral compression and driving band.

5. In a banding-machine, the combination set forth of a main frame; pipe-carrying wheels arranged on the main frame; a band-shifting frame arranged on the main frame and adapted to be adjusted transverse such frame; pipe guiding and supporting wheels arranged on the main frame; suitable band driving and guiding wheels arranged in the main frame at one side of the adjustable frame; an endless band trained around such wheels and adapted to be wound spirally about a pipe arranged upon the pipe-carrying wheels; a tension device for holding the band taut; means for driving the band; a wrapping device adapted to wrap the pipe as it is released from the traveling band; and suitable means for adjusting the band-adjusting frame.

6. In a banding-machine, the combination set forth of a main frame; a compressing band-carrying frame arranged to be adjusted transverse the main frame; pipe supporting and carrying wheels arranged upon the main frame; means for adjusting the band-carrying wheels; band driving and guiding wheels arranged at one side of the adjustable frame; an endless band trained around the driving and guiding wheels and adapted to be wrapped spirally about a pipe arranged upon the pipe-carrying wheels; means for driving the band; means for wrapping the pipe as it is released from the band; and means for adjusting the adjustable frame.

7. A banding-machine comprising an endless cable having a portion of its length adapted to be spirally wound about a pipe; means for driving the band to rotate the pipe and to cause it to travel forward; a wrapping device for wrapping the pipe; and means for adjusting the band to cause it to feed the pipe axially forward or to remain stationary with relation to the wrapping device while rotating.



8. In a pipe-banding machine, a clamp for holding the ends of the pipe-sections together and comprising two approximately semicircular members each roughened upon its inner face at each end with points adapted to take into the wood of the pipe, and screw-bolts centrally arranged at the mid-length of the members to hold them together.

9. In a pipe-banding machine, a clamp for holding the ends of the pipe-sections together and comprising two plates to fit upon the outside of the pipe and provided with points to take into the pipe and respectively reinforced at the mid-length, and screw-bolts centrally arranged and passing through the reinforced portion to draw the members together.

10. In a pipe-banding machine, a clamp for holding the ends of the pipe-sections together and comprising two approximately semicircular members to fit upon the outsides of two sections of pipes, one member being provided with a screw-threaded bolt-hole, and the other member with a countersunk bolt-hole; and a clamp-bolt passed through the countersunk bolt-hole and screwed into the screw-threaded bolt-hole and passing through the axis of the cylinder formed by the two members while thus held together.

603,393. AUTOMATIC FILLER FOR LUBRICATORS.

NICHOLAS ZOSS, New York, N. Y. Filed Dec. 23, 1896. Serial No. 617,213. (No model.)

Claim.—The combination with a lubricator, of the continuously-feeding automatic filler consisting of a can or tank adapted to be closed air-tight, and the nozzle adapted for discharging liquid from the can through its open lower end, and having a vent-orifice in the side near but above the lower end admitting the air for venting directly into the discharge-passage for the liquid, said end and the lubricator adapted for inserting said end in the upper part of the lubricator which is open to the atmosphere, and in the liquid contents thereof, and the nozzle having a stop-cock between the vent-orifice and the can, substantially as described.

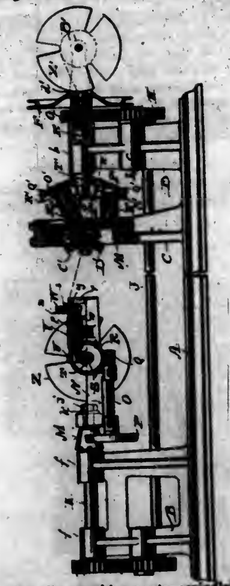
603,394. WIRE-THREADING MACHINE.

ORRELL ASHTON, Milwaukee, Wis. Filed Sept. 24, 1897. Serial No. 652,800. (No model.)

Claim.—1. In a wire-threading machine, threading-rollers, each adjustable toward and from the wire, and each having its axis after adjustment parallel with the position it occupied previous to adjustment, and means for positively driving said rollers.

2. In a wire-threading machine, positively-driven threading-rollers, and adjustable mechanism for constantly maintaining each of the rollers at the same angle of contact with the wire.

3. In a wire-threading machine, threading-rollers, brackets for said rollers, and pivots for said brackets which are substantially parallel to the line of feed of the wire.

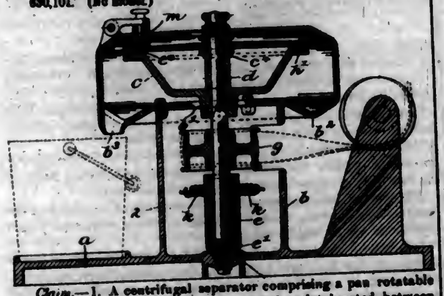


4. In a wire-threading machine, a fixed apertured support, pivot-studs extending from said support in lines substantially parallel to the line of feed of the wire, wire-threading rollers, and brackets for said rollers fulcrumed on said pivot-studs.

5. In a wire-threading machine, a fixed support, pivot-studs extending from said support in lines substantially parallel to the line of feed of the wire, wire-threading rollers, brackets for said rollers fulcrumed on said pivot-studs, and means for adjusting said brackets with relation to the wire.

6. In a wire-threading machine, a support, having pivot-studs arranged substantially parallel to the line of feed of the wire, brackets fulcrumed on said pivot-studs, and having inclined bearings, shafts in said bearings, wire-threading rollers on said shafts, and mechanism for imparting rotary motion to said shafts.

7. In a wire-threading machine, a rotary spindle, rotary wire-threading rollers arranged obliquely to the wire, adjustable mechanism for maintaining said rollers at the same angle of contact with the wire irrespective of their movement toward and from the same, and mechanism for transmitting movement from said spindle to said rollers.



8. In a wire-threading machine, a rotary spindle, rotary wire-threading rollers arranged obliquely to the wire, adjustable mechanism for maintaining said rollers at the same angle of contact with the wire irrespective of their movement toward and from the same, mechanism for transmitting an intermittent movement from said spindle to said rollers.

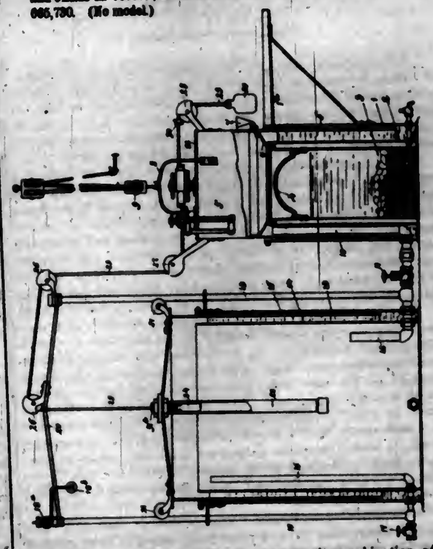
9. In a wire-threading machine, a rotary spindle, wire-threading rollers, and mechanism actuated by the spindle for imparting a step-by-step movement to said rollers.

10. In a wire-threading machine, a rotary spindle, wire-threading rollers and mechanism including pawls and ratchets for transmitting a step-by-step motion from the spindle to the rollers.

608,895. CENTRIFUGAL MACHINE. SAMUEL A. BAKER and MELVIN F. COLBY, Springfield, Vt. Filed Mar. 31, 1897. Serial No. 630,101. (No model.)

Claim.—1. A centrifugal separator comprising a pan rotatable on a vertical axis and having a contracted outlet located between surfaces which are formed to arrest relatively coarse fragments or particles, and an external fibrous filter adapted to arrest the relatively fine particles that escape through said outlet with the centrifugally-expelled liquid and to permit the outward passage of said liquid, said fibrous filter being clamped between opposing annular supports adjacent to said contracted outlet.

2. A centrifugal separator comprising a pan rotatable on a vertical axis and having a contracted outlet located between surfaces which are formed to arrest relatively coarse fragments or particles, external clamping members at opposite sides of said outlet, one of which members is formed by a projecting rim or flange of the cover of the pan and a fibrous filter held by said clamping members in the path of liquid expelled centrifugally through said outlet, said filter being adapted to arrest the relatively fine particles that escape through the outlet, and to permit the outward movement of said liquid.



3. A centrifugal separator comprising a pan and cover rotatable on a vertical axis and having a contracted outlet located between surfaces which are formed to arrest relatively coarse fragments or particles, one of said surfaces being the inner side of the cover resting on the margin of the pan, said cover being extended outwardly as a clamping member beyond the margin of the pan, a complemental clamping member or ring detachably connected with the cover, and a fibrous filter interposed between said clamping members.

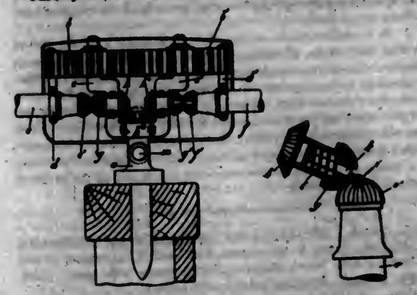
608,896. CUFF-BUTTON. WILLIAM S. BUCHTOLD, Newark, N. J. Filed Feb. 25, 1897. Serial No. 625,067. (No model.)

Claim.—A cuff-button having its heads concaved or recessed on their backs, attaching-eyes of square or like cross-section secured to the heads and lying wholly within the cavities of the same so as not to interfere with the passage of the heads through the buttonholes, an S-shape link having overlapping ends slidably secured with respect to the central limb of the link, and passed through the attaching-eyes of the heads; said link acting as a spring at its points of connection with the attaching-eyes to hold the heads either at right angles to the link or in planes substantially parallel to the same, substantially as described.

608,897. ACETYLENE-GAS GENERATOR. THOMAS A. BRYAN and JAMES H. COOPER, Baltimore, Md. Filed Jan. 6, 1896. Serial No. 625,790. (No model.)

Claim.—1. In an acetylene-gas generator the combination, of a water-tank and carbid-receptacle with a gasometer; the carbid-receptacle having means through which it may be charged or filled and being divided into compartments, all except one, which is permanently closed, having hinged bottoms which rest upon a support provided with an open section so located as to permit the hinged bottoms of the compartments to fall and dump their contents into the tank as they pass over it, means for closing this open section in the support so arranged and connected with the means for charging or filling the carbid-receptacle that when the means for charging or filling the carbid-receptacle is open or active the opening in the support below the carrier will be closed, and vice versa, substantially as shown.

2. In an acetylene-gas generator the combination, of a water-tank and a carbid-receptacle, with a gasometer, the carbid-receptacle consisting of a carrier divided into compartments, each having a hinged bottom, except one which is solid, said bottoms being provided with rollers, a permanent support below the carrier provided with a track upon which the rollers of the bottoms rest, and by which they are supported, the support and track having a movable section which, when open will permit the bottom of one of the said car-



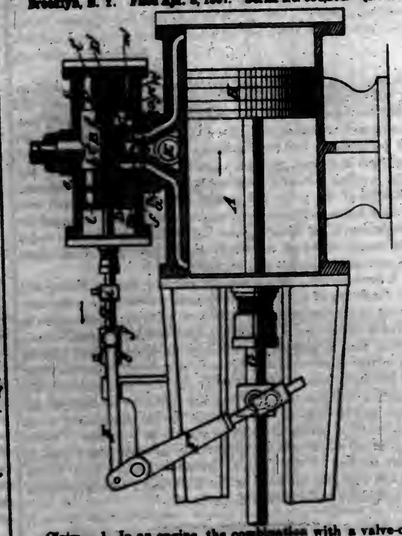
partments to fall as it passes over said section and dump its contents of carbid into the water, the charging-hole in the top of the gasometer for charging carbid into the receptacle provided with a cover, means for connecting the cover with the movable section of track of the support adapted to maintain the movable section of track in place and support the bottoms of all of the compartments when the cover of the charging-hole is open and to drop the section of track and leave the open section for dumping when the cover of the charging-hole is closed, substantially as described.

3. In an acetylene-gas generator the combination, of a water-tank and a carbid-receptacle, with a gasometer, the carbid-receptacle consisting of a carrier, divided into compartments, each having a hinged bottom, except one, a permanent support below said carrier supporting said bottoms, said support being provided with an open section adapted to permit the bottom of one of said compartments to fall as it passes over it and thus dump its contents into the water, the carrier being mounted upon a rotating shaft which passes through the generator and is provided upon its exterior with a ratchet and lever, the ratchet being rigidly secured and the lever journaled upon the shaft and carrying a pawl which engages and operates the ratchet, said lever being connected at its extremity to a cord which passes over a series of pulleys, and each end of which is provided with a weight, one being heavier than the other, a stop upon the cord to limit its motion under the influence of the heavier weight and means connecting the other end of the cord with the bell of the gasometer whereby as the said bell descends it will pull the cord and operate it and the lever and carrier against the pull of the heavier weight.

4. In an acetylene-gas generator the combination of a gasometer, having an opening through which the carbid for charging the generator is supplied, said opening having a removable cap, a carbid-carrier contained within the gasometer, and a support under the carrier, said support having a movable section connected to the cap in such a way that the act of opening the cap closes the movable section of the support, and the act of closing the cap opens the movable section of the support.

5. In an acetylene-gas generator, the combination of a gasometer having an opening in the top through which the carbid for charging the generator is supplied, said opening having a removable cap, a carbid-carrier contained within the gasometer, said carrier being divided into a number of compartments having hinged bottoms except one which is permanently closed, rollers attached to the bottoms, and a support under the carrier having a track upon which the rollers rest, a section of the track being hinged and connected by a system of levers to the removable cap on the top of the gasometer, so that the act of removing the cap closes the track, and the act of closing the cap opens the track, all arranged and constructed substantially as and for the purposes set forth.

608,898. BOW-FACING GAR. ADOLPH BALLMER, Kiel, Germany. Filed Apr. 15, 1897. Serial No. 632,303. (No model.)



Claim.—1. In oars and rowlocks for boats, the combination with the handle and oar-stem independent of one another, of gearing supported on bearings independent of said handle and stem, connections between said gearing and the handle and stem respectively, whereby the movements imparted to the handle will be transmitted to the gearing and thence to the oar-stem, and a working feathering connection, independent of said gearing, between the handle and stem, whereby the movements imparted to the handle upon its axis will be transmitted to the oar-stem and the blade thereof may be turned or feathered.

2. In rowlocks and oars for boats, the combination with the handle and oar-stem independent of one another, of a frame, gears *b*, *b'* carried by said frame on bearings independent of the handle and stem, connections between the handle and stem and said gears *b*, *b'* respectively, with freedom for the handle and stem to turn therein, semispherical gearings on the ends of the handle and stem, and a working feathering connection between said semispherical gearings.

3. In rowlocks and oars for boats, the combination with the handle and oar-stem independent of one another, of a frame, gears *b*, *b'* carried by said frame on bearings independent of the handle and stem, connections between the handle and stem and said gears *b*, *b'* respectively, with freedom for the handles and stem to turn therein, the hemispherical gears *d*, *f'*, on the ends of the handle and stem respectively, the hemispherical gears *g g'* meshing therewith, and a working feathering connection between the gears *g*, *g'*.

4. In rowlocks and oars for boats, the combination with the handle and oar-stem independent of one another, a frame, gears *b*, *b'* carried by said frame on bearings independent of the handle and stem, connections between the handle and stem and said gears *b*, *b'* respectively, with freedom for the handle and stem to turn therein, the hemispherical gears *d*, *f'*, on the ends of the handle and stem respectively, the hemispherical gears *g g'* meshing therewith and jointed thereto, and a working feathering connection between the gears *g*, *g'*.

608,899. VALVE-OPERATING DEVICE. WILLIAM A. DREWETT, Brooklyn, N. Y. Filed Apr. 8, 1897. Serial No. 631,201. (No model.)

Claim.—1. In an engine, the combination with a valve-chest, a two-headed piston therein and a single valve interposed with a lost motion between the piston-heads, of a main exhaust-port in the chest controlled by the valve, and two supplemental exhaust-passages each communicating with the valve-chest by two ports so located that one of them is opened and closed to the main exhaust-port by the passage by it of the valve and the other of them is opened and closed to the space between the adjacent end of the chest and the piston by the movement over it of the piston itself, substantially as herein described.

2. The combination of a valve-chest and a valve therein for controlling the induction and the eduction of the motive fluid to and from an engine and a two-headed piston working within said chest and between the heads of which said valve works with a lost motion, the said chest being provided with external passages each of which has ports communicating with the interior thereof at two points in its length, the said piston having in each head a lateral port in communication with the space between the said head and the adjacent end of the chest, and the valve itself having two lateral exhaust-ports one for each of said passages, each of said lateral exhaust-ports being capable of communicating with one end of its respective passage while the other end of said passage is in communication with the said lateral port in one of the piston-heads, substantially as herein described.

3. In an engine, the combination of a cylindrically-bored valve-chest to which there is an inlet for the motive agent and within the bore of which is a valve-seat having ports communicating respectively with the ends of the engine-cylinder and with an exhaust-outlet, a piston having two heads fitted to the bore of said chest with an intermediate space which includes said inlet and ports, the two heads having passages through them which form constant communi-

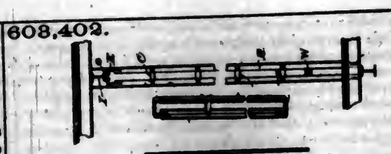
cation from said intermediate space to the spaces between the piston and the ends of the chest and having also lateral ports communicating with the last-mentioned spaces, a D-valve fitted to said seat in the bore of the chest and capable of a lost motion between the two piston-heads and containing lateral exhaust-ports, and two passages outside of the valve-chest each of said passages having two terminal ports communicating with the valve-chest, one of said terminal ports being within range of one of the lateral ports of the valve and the other of said terminal ports being within range of the lateral ports in one of the piston-heads, substantially as herein described.

608,400. LATHE ATTACHMENT. ALBERT J. FARMER, Hartford, Conn. Filed Dec. 27, 1897. Serial No. 663,467. (No model.)

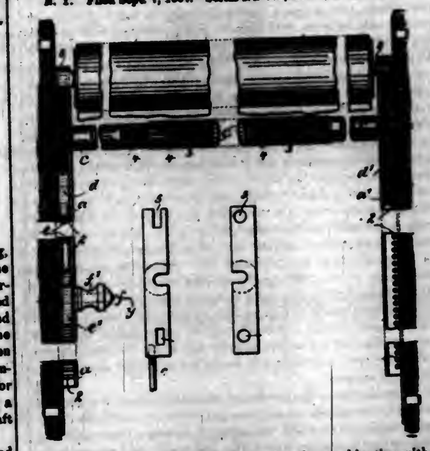
Claim.—1. A portable lathe attachment for grinding, drilling, boring and turning, consisting of a yoke with a shank whereby the yoke may be secured to the tool-post of a lathe and a tapering perforation in each branch of the yoke, a tapering split bushing located in each perforation, nuts turning on the bushings for adjusting and holding them in correct position, a sleeve rotarily supported by the bushings, a pulley mounted upon and secured to the sleeve between the branches of the yoke, and a shaft extending through and connected by a spline with the sleeve and having one end arranged for the attachment of an operating-tool and having at the other end a head by means of which the longitudinal movements of the shaft may be controlled, substantially as specified.

2. A portable lathe attachment for grinding, drilling, boring and turning, consisting of a yoke with a shank whereby the yoke may be secured to the tool-post of a lathe and a tapering perforation in each branch of the yoke, a tapering split bushing located in each perforation, nuts turning on the bushings for adjusting and holding them in correct position, a sleeve rotarily supported by the bushings, a pulley mounted upon and secured to the sleeve between the branches of the yoke, a shaft extending through and connected by a spline with the sleeve and having one end arranged for the attachment of an operating-tool and having at the other end a head by means of which the longitudinal movements of the shaft may be controlled, a bracket removably secured to the yoke, a feed-screw rotarily held by the bracket and engaging the head on the shaft, and a handle for rotating the feed-screw, substantially as specified.

608,401. CLASP. JOSEPH FORSHEIM, New York, N. Y. Filed Sept. 8, 1897. Serial No. 650,901. (No model.)



Claim.—A clasp comprising a blank forming a back plate having inclined edged wings bent inwardly therefrom, the said wings being provided with securing-tongues and a stop bent inwardly from the blank thereby forming a strap retaining loop, a second blank forming a front plate which front plate is provided with notches for the reception of the said tongues carried by the back plate for securing the front plate thereto and a locking-roller interposed between the said plates, substantially as set forth.



608,402. PARTITION-FRAME. WILLIAM P. KRAMER, Boston, Mass. Filed Oct. 20, 1897. Serial No. 656,754. (No model.)

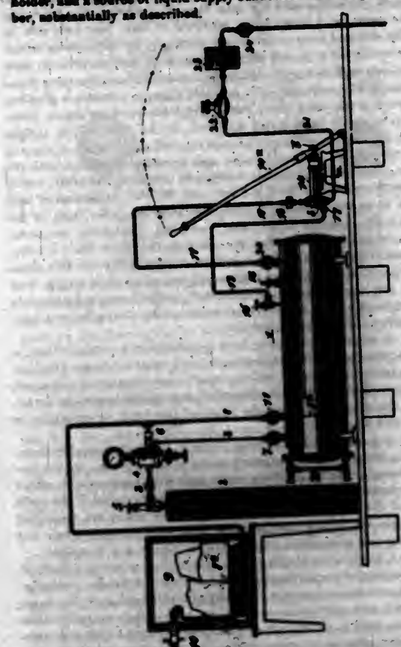
Claim.—A partition-frame comprising in its construction parallel angle-iron side strips separated and connected by cross-pieces and a U-shaped strap with slot-and-pin connection with the side strips constituting an adjustable end piece, substantially as described.

608,402.

608,408. WINDOW-SHADE CARRIER. HERBERT L. KEYES, Hackensack, N. J., assignor to himself, and Harry C. Horton, Newburg, N. Y. Filed Sept. 7, 1897. Serial No. 650,715. (No model.)

Claim.—1. In a window-shade carrier, the combination with the slotted bars and their racks, of pinions engaging the racks, bearing-blocks within the slotted bars and receiving the journals of the pinions, an extensible cross-bar upon whose respective ends are the pinions, said bar being made of two telescoping tubular portions of the same and coinciding sectional configuration, and a clamp for holding the bearing-block at one side of the window, substantially as set forth.

2. In a window-shade carrier, the combination with the slotted bars and their racks, of pinions engaging the racks, bearing-blocks within the slotted bars and receiving the journals of the pinions, an extensible cross-bar upon whose respective ends are said pinions, the same extending across the window between the slotted bars and a clamp for holding the bearing-block at one side of the window, substantially as set forth.



3. In a window-shade carrier, the combination with the slotted bars and their racks, of pinions engaging the racks, bearing-blocks within the slotted bars receiving the journals of the pinions and having openings or notches above and below said journals adapted to receive the fixtures upon the ends of the window-shade roller, an extensible cross-bar upon whose ends are said pinions and extending across the window and by which the pinions are rotated and the respective bearing-blocks moved uniformly and parallel to one another, and a clamp for holding the bearing-block at one side of the window, substantially as set forth.

608,404. APPARATUS FOR CARBONATING AND DISPENSING LIQUIDS. PETER H. MALLERSON, New York, N. Y., assignor to the Diamond Soda Water Manufacturing Company, same place. Filed Nov. 30, 1896. Serial No. 613,912. (No model.)

Claim.—1. In an apparatus for carbonating liquids, a cylinder or vessel connected by a pipe with a gas-holder, a pump exterior to and connected with said cylinder by two pipes, both of said pipes being independent of the pipe from the gas-holder, means for supplying said pump with a liquid, and valves to control the passage of gas from said cylinder to said pump through one pipe, and to control the passage of the same gas and a liquid from said pump to said cylinder through the other pipe, substantially as described.

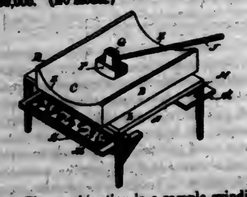
2. The combination of a cylinder or vessel, a pump, a pipe connecting them for the passage of gas to the pump, a pipe connecting said cylinder with said pump for the passage of liquid from the latter to the former, valves to control the passage through said pipes, and a nozzle connected with the second-mentioned pipe within said cylinder, said nozzle having its end closed and slits in its side arranged to converge toward a point exterior thereto, substantially as described.

3. The combination with the gas-holder 2, a force-pump having a compression-chamber, the cylinder 1, pipes and controlling devices connecting the gas-holder with the pump-chamber through the gas-space of cylinder 1, a return-pipe connecting the pump and gas-space of cylinder 1 independently of the latter's connection with the gas-holder, and a source of liquid-supply connected with the pump-chamber, substantially as described.

4. The combination with the detachable gas-holder 2, a force-pump having a compression-chamber, the cylinder 1, pipes and devices controlling the passage of the gas from the holder through the gas-space of the cylinder to the pump-chamber, a return-pipe connecting the pump-chamber and gas-space of the cylinder, and a source of liquid-supply connected with the pump-chamber, a dispensing faucet, the cooling-chamber, a coil in said chamber, and pipes connecting the liquid-space of the cylinder 1 with the coil and the latter with the faucet independently of the before-mentioned pipes, substantially as described.

5. The combination with the gas-holder 2, a force-pump, the cylinder 1, pipes and devices controlling the passage therethrough, said pipes connecting the gas-holder with the pump through the cylinder, a return-pipe connecting the pump and cylinder, and a source of liquid-supply connected with the pump, a dispensing-faucet, the cooling-chamber, a coil in said chamber, and pipes connecting the cylinder 1 with the coil and the latter with the faucet, substantially as described.

6. The combination with the gas-holder 2, the cylinder 1, a force-pump, a pipe connecting the inlet of the pump with the cylinder 1, a water-supply connected with said inlet, a pipe leading from the outlet of the pump to said cylinder 1, a pipe connecting the gas-holder and cylinder 1, and, means for equalizing the water and gas pressure at the pump-inlet, substantially as described.



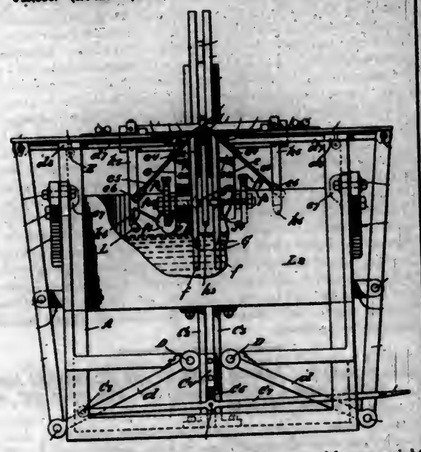
7. The combination with the gas-holder, the cylinder 1, the pipe 12 leading to the fluid-space in said cylinder and extending exteriorly of the cylinder by a pipe 8 to a suitable dispenser, a pipe 3 extending between the gas-holder 2 and the gas-space in cylinder 1, a pipe 13 leading from the gas-space in the cylinder to a force-pump, a pipe 21 leading to the pump from a fluid-supply, and a pipe 18 leading from the pump and terminating in the split nozzle 28 extending into the gas-space of the cylinder 1, substantially as described.

8. In a device for carbonating liquids the combination with the longitudinally-disposed cylinder 12, the gas-holder 2, the valve-regulated pipe 3 leading from the holder to the gas-space of said cylinder, a pump having a compression-chamber, a pipe 21 leading from a liquid-supply to the inlet of said chamber, a pipe 13 leading from the gas-space of said cylinder to said pump-chamber, a pipe 18 leading from said pump-chamber to the gas-space in said cylinder, a pipe 12 leading from the bottom of said cylinder, a cooling-box, a pipe-coil in said box, a pipe 8 leading from the pipe 12 to one end of said coil and having a valve 11, and a faucet 10 exterior to said box and in communication with the other end of said coil, substantially as described.

9. In a device for carbonating liquids, the combination with the horizontally-disposed cylinder 12, the gas-holder 2, the valve-regulated pipe 3 leading from the holder to the gas-space of said cylinder, a pump having a commingling and compression chamber comprising two separate and valve-controlled compression-compartments, a barrel having a plunger in communication with one of the compartments, and a by-pass in communication with the barrel and the other compartment, inlet and outlet compartments above and below the compression-compartments, a pipe 21 leading to the inlet-compartment, a pipe 13 leading from the gas-space of cylinder 12 to said inlet-compartment, a pipe 18 leading from the outlet-compartment to the gas-space of said cylinder, and means for operating said plunger, substantially as described.

10. In a device for carbonating and dispensing liquids, the combination with the horizontally-disposed cylinder 12, the gas holder 2, the valve-regulated pipe 3 leading from the holder to the gas-space of said cylinder, a pump having a compression-chamber, a pipe 21, leading from a liquid-supply to the inlet of said chamber, a pipe 13 leading from the gas-space of said cylinder to said pump-chamber, a pipe 18 leading from said pump-chamber to the gas-space in said cylinder, a pipe 12 leading from the bottom of said cylinder, a cooling-box, a pipe-coil in said box, a pipe 8 leading from the pipe 12 to one end of said coil and having a valve 11, and a faucet 10 exterior to said box and in communication with the other end of said coil, substantially as described.

608,405. SAMPLE GRINDING AND PULVERIZING APPARATUS. JAMES A. MCCLURE, Denver, Colo. Filed June 1, 1897. Serial No. 639,005. (No model.)



Claim.—1. The combination in a sample grinding and pulverizing apparatus of a mortar-plate having a transverse, concaved grinding-surface with open terminal ends; a receding stepped recess at each end at its bottom edge adapted to form an overhanging lip at the delivery ends of said mortar-plate, with a muller comprising a block-shaped member having its bottom curved with a curve of slightly less radius than the transverse curve of the mortar-plate and having all its bottom edges rounded, a handle-eye in said muller and a curved handle in said eye curved to extend upward from said eye above the sides of said mortar-plate and then curved to extend outward beyond said mortar-plate in a plane substantially parallel and horizontal to the horizontal plane of said muller, substantially as described.

2. The combination in a sample grinding and pulverizing apparatus of a mortar-plate having a transverse concaved grinding-surface and open ends flush with its grinding-surface at the terminal ends of its length and having its ends at the terminus of its length project beyond the bottom of said mortar-plate and arranged to form a recess under said ends high enough to allow the side of a pan to be placed therein, a muller comprising a block-shaped member having a curved bottom adapted to the curve of the transverse curve of the grinding-surface of said mortar-plate and having its bottom sides and end edges rounded, a centrally-located, vertically-projecting member on the top of said muller, a handle-eye in said projection and a curved handle in said eye extending above and beyond the borders of said mortar-plate, with a supporting table or bench shorter than the length of said mortar-plate, a shelf supported between the legs of said table or bench at the ends of its length and under the ends of the length of said mortar-plate, and pans on said shelves under the overhanging ends of said mortar-plate, substantially as described.

3. The combination in a sample grinding and pulverizing apparatus for assayers and chemists of a rectangular-shaped mortar-plate having a transversely-concaved grinding-surface and having both of the terminal ends of its length open, with a muller comprising a rectangular block-shaped member having a curved bottom surface curved to operatively engage the grinding-surface of said mortar-plate and having its bottom side and end edges rounded and adapted to be manually reciprocated up and down said transverse-curved surface of said mortar-plate, a handle-eye in said muller and a curved handle extending a short distance beyond the mortar-plate and curved from said eye to diverge upward over the transverse-curved sides of said mortar-plate and then extending substantially parallel to the plane of the curved base of said muller, substantially as described.

608,406. BOOKBINDING-MACHINE. JAMES MCCLELLAN, Brooklyn, N. Y., assignor, by direct and mesne assignments, to himself, George Henry McClellan, Arlington, N. J., and Gilbert Hunt McKibbin and Boyd Everett, New York, N. Y. Filed July 3, 1897. Serial No. 643,333. (No model.)

Claim.—1. A machine for binding books, comprising an upright main frame, levers pivotally connected with the sides of the main frame, and projecting in front thereof, plates or supports connected with the rear ends of said levers and adapted to move vertically in the main frame, a glue box mounted in said main frame, a book-carrying frame connected with said vertically-movable plates or supports, and suspended over said glue-box, transversely-movable table-plates mounted on the main frame and in operative connection with said vertically-movable plates or supports, hangers connected with said transversely-movable table-plates, revoluble plates mounted in said hangers and adapted to turn in the glue-box, and means for operating said parts, substantially as shown and described.

2. A machine for binding books, said machine consisting of a main frame, levers pivotally connected with the sides of the main frame, and projecting in front thereof, vertical plates or supports connected with the rear ends of said levers, a book-carrying frame connected with said supports, transversely-movable table-plates mounted on the main frame and in operative connection with said plates or supports, hangers connected with the inner ends of said table-plates, revoluble plates connected with said hangers, means connected with said book-carrying frame for operating said revoluble plates, and a treadle connected with the front end of said levers, substantially as shown and described.

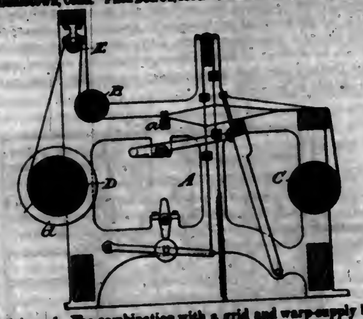
3. A machine for binding books, comprising a main frame, a glue-box mounted therein, levers pivotally connected with the sides of the main frame, and projecting in front thereof, vertically-movable plates or supports connected with the rear ends of said levers, transversely-movable table-plates mounted on said main frame and in operative connection with the lower ends of said plates or supports, a book-carrying frame adjustably mounted in said plates or supports, and projecting forwardly over the glue-box, hangers connected with the inner ends of said transversely-movable table-plates, revoluble glue-plates connected with said hangers and suspended in the said glue-box, said glue-plates being provided with shafts which pass through said hangers, ratchet-wheels mounted on said shafts, ratchet arms also mounted on said shafts, and provided with pawls which operate in connection with said ratchet-wheels, devices connected with the book-carrying frame for operating said ratchet-arms, and means for operating said levers, substantially as shown and described.

4. A machine for binding books, comprising a main frame, levers pivotally connected with the sides thereof, and projecting forwardly of the frame, said levers being provided at their rear ends with inwardly-directed arms or extensions, vertically-movable plates or supports connected with said arms or extensions and provided at their lower ends with forwardly-directed extensions, a book-carrying frame connected with said vertically-movable plates or supports, a glue-box mounted in the main frame below said book-carrying frame, transversely-movable table-plates mounted on the main frame, upright levers connected with the outer ends thereof, and pivotally connected with the sides of the main frame, rods pivotally connected with the lower ends of said last-named levers, and extending inwardly, and in operative connection with the inwardly-directed extensions of said plates or supports, hangers connected with the inner ends of the transversely-movable table-plates, revoluble glue-plates connected with said hangers and devices for operating said parts, substantially as shown and described.

5. A machine for binding books, comprising a main frame, levers pivotally connected with the sides thereof, and projecting forwardly of the frame, said levers being provided at their rear ends with inwardly-directed arms or extensions, vertically-movable plates or supports connected with said arms or extensions, and provided at their lower ends with forwardly-directed extensions, a book-carrying frame connected with said vertically-movable plates or supports, a glue-box mounted in the main frame below said book-carrying frame, transversely-movable table-plates mounted on the main frame, upright levers connected with the outer ends thereof, and pivotally connected with the sides of the main frame, rods pivotally connected with the lower ends of said last-named levers, and extending inwardly, and in operative connection with the inwardly-directed extensions of said plates or supports, hangers connected with the inner ends of the transversely-movable table-plates, revoluble glue-plates connected with said hangers and devices for operating said parts, the inwardly-directed extensions at the lower ends of said vertically-movable plates or supports being provided with a supplemental plate or arm with which said upright levers are connected, and said supplemental plate or arm being also in operative connection with a treadle-lever, substantially as shown and described.

6. A machine for binding books, comprising a suitable frame, a glue or paste pot mounted therein, a book-carrying frame provided with a horizontal support which projects over the glue or paste pot, and from which the book is suspended, and operative devices for applying the glue or paste to the sides of the book, substantially as shown and described.

7. In a machine for binding books a vertically-movable book-carrying frame, and transversely-movable table-plates, said table-plates being provided at their inner ends with hangers with which are connected revoluble glue-plates, a glue-box mounted in the main frame of the machine in which said revoluble plates are suspended and means for raising and lowering said book-carrying frame and revolving said glue-plates, substantially as shown and described.



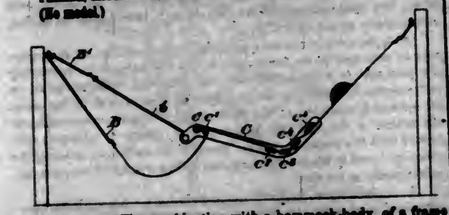
8. A machine for binding books constructed as herein described, and consisting of a main frame, a glue-box mounted therein, vertically-movable plates or supports, a vertically-movable book-carrying frame connected with said plates or supports, transversely-movable table-plates mounted on the main frame, hangers connected with said table-plates and adapted to move therewith, glue-plates revolubly connected with said hangers and suspended in said glue-box, ratchet-wheels connected with the shafts of the glue plates, operative devices connected with the vertically-movable book-carrying frame, and with said ratchet-wheels, and means for operating said vertically-movable plates or supports, and said transversely-movable table-plates, substantially as shown and described.

9. A machine for binding books constructed as herein described, consisting of a main frame, levers pivotally connected with the sides of the main frame, and projecting forwardly thereof, a treadle connected with the forward ends of said levers, vertically-movable plates or supports connected with the rear ends of said levers and provided at their lower ends with forwardly-directed extensions, transversely-movable table-plates mounted on the main frame and in operative connection with the extensions at the bottom of said vertically-movable plates or supports, a glue-box mounted in the main frame, hangers connected with the inner ends of said transversely-movable table-plates, revoluble plates connected with said hangers, a vertically-movable book-carrying frame connected with said vertical plates or supports, ratchet-wheels connected with said glue-plates and devices connected with the book-carrying frame for operating said ratchet-wheels, substantially as shown and described.

10. A machine for binding books comprising a main frame, a glue-box mounted therein, transversely-movable table-plates mounted on the main frame, and provided with hangers at their inner ends, revoluble glue-plates connected with said hangers and suspended in the glue-box, a vertically-movable book-carrying frame supported above the main frame of the machine, and means for raising and lowering said book-carrying frame and for operating said transversely-movable table-plates and for revolving said glue-plates, substantially as shown and described.

11. A machine for binding books comprising a main frame, a glue-box mounted therein, transversely-movable table-plates mounted on the main frame over said glue-box, hangers connected with the inner ends of said table-plates, revoluble glue-plates connected with said hangers and suspended in the glue-box, a vertically-movable book-carrying frame supported above the main frame of the machine, and adapted to be lowered between said glue-plates, operative devices connecting said book-carrying frame and said glue-plates, means for operating said book-carrying frame and said transversely-movable table-plates, substantially as shown and described.

608,407. MEANS FOR FORMING WIDE SHEDS OF WARP FROM NARROW OR SHORT SUPPLY-BEAMS. ISAAC E. PALMER, Middletown, Conn. Filed Dec. 31, 1896. Serial No. 617,804. (No model.)



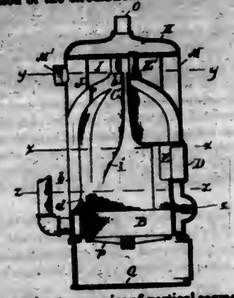
Claim.—1. The combination with a grid and warp-supply beam, of mechanism for distributing warp as it extends from the supply-beam to form a shed wider than the length of the supply-beam, comprising a distributing device located intermediate of the grid and the supply-beam, said distributing device being provided with a warp-bearing surface which gradually approaches the axis of the warp-beam as it extends from a point opposite a central portion of the warp-beam toward its extremities and means for holding the warp in engagement with the surface of the distributing device and directing it to the grid, substantially as set forth.

2. In combination a warp-supply-beam, distributing-rollers having their axes inclined to the axis of the warp-supply beam for distributing the warp as it extends from the beam and means for holding the warp in engagement with the distributing-rollers, substantially as set forth.

3. In combination a warp-supply beam, a grid, distributing-rollers having their axes inclined to the axis of the warp-supply beam for distributing the warp as it extends from the beam and means for further distributing the warp after it leaves the said inclined distributing-rollers and before it reaches the grid, substantially as set forth.

4. The combination with an arched spindle and means for holding it in fixed position, of a roller of flexible material mounted on the arched spindle and means for directing warp along the surface of said roller in engagement therewith for distributing the warp, substantially as set forth.

608,408. SEAT ATTACHMENT FOR HAMMOCKS. ISAAC E. PALMER, Middletown, Conn. Filed Feb. 11, 1897. Serial No. 622,997. (No model.)

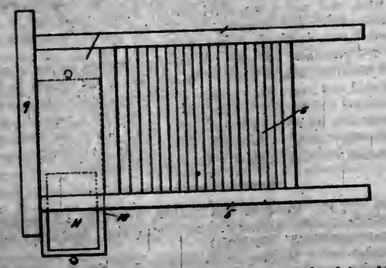


Claim.—1. The combination with a hammock-body, of a frame engaged therewith, said frame being provided with bearings so located as to interrupt the natural curve of the hammock-body to form a seat, the body of the hammock being folded back into engagement with one of the bearings to lock one end of the body in its adjustment and suspension-cords leading respectively from one end of the hammock-body and from the seat-frame, substantially as set forth.

2. The combination with a hammock-body, of a frame engaged therewith, said frame being provided with bearings so located as to interrupt the natural curve of the hammock-body to form a seat, the body of the hammock being folded back into engagement with one of the bearings to lock one end of the body in its adjustment, main suspension-cords leading respectively from one end of the hammock-body and from the seat-frame and an auxiliary suspension-cord leading from the opposite end of the hammock-body, substantially as set forth.

608,409. WATER-HEATER. JOHN A. RATHBONE, Detroit, Mich., assignor to the United States Heater Company, same place. Filed July 6, 1897. Serial No. 643,888. (No model.)

Claim.—1. A water-heater composed of a series of vertical sections, each section comprising a segmental water-shell having converging walls whereby it contracts toward the top, lobes overhanging the fire on the inner face of the shell and having free communication with the interior of the shell, the shells and lobes converging to a common point, uptake-pipes from this point, this arrangement of shell and lobes forming corresponding converging smoke-flues whereby the heat is concentrated at the point of greatest speed of the circulation of the heater and the products of combustion move along with the direction of the circulation.

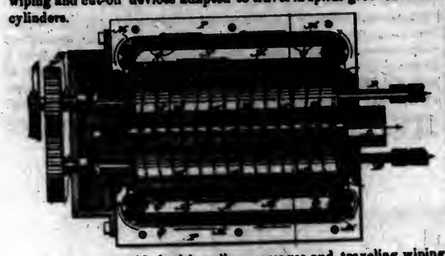


2. In a water-heater, a series of vertical segmental sections, each comprising a water-shell contracting and overhanging at the top separated at the inner ends to form a smoke flue or flues, a series of lobes springing (with inclined lower walls) from the shell-sections and merging into a discharge common to the discharge from the contracted end of the shell-sections, thereby forming a series of contracting flues between the lobes, a series of uptake-pipes from the upper inner ends of the sections, a common dome, or chamber into which they connect, and a smoke-chamber between this dome and the heater-body.

3. In a water-heater comprising sections each segmental ring-shaped, contracting into a dome shape at the top, the inner wall of the section having the curved faces c d, at the sides and bottom to the outside wall, the central lobes C, having the lower inclined walls x x and the extensions A, into which the contracting ends of the shell-sections merge, and the exit-pipes E' from these extensions.

4. In a water-heater, the combination of sections forming ring-segments curved inward at the top both outside and in and with converging sides, inwardly-projecting lobes at the upper part of each section terminating at the inner edge of the top of the section, the water-exit for the sections at the top of the lobes and smoke-flues formed through the tops of the sections between and beside the lobes.

608,410. WASHBOARD. LEWIS RITCHIE, Patchogue, N. Y. Filed Aug. 11, 1897. Serial No. 647,812. (No model.)

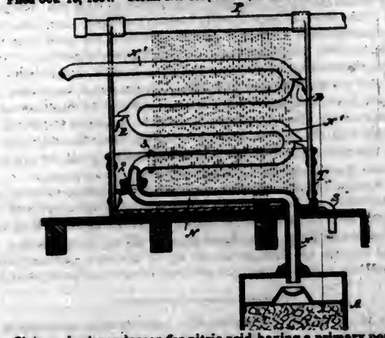


Claim.—A washboard provided with a crown-head in which is formed a chamber which is open at both ends, and a soap-holder placed in said chamber and provided at its opposite ends with chambers or receptacles which open in opposite directions, substantially as shown and described.

608,411. MACHINE FOR PLOTTING SOAP. FRANCIS S. RETTENMAIR, Philadelphia, Pa. Filed May 27, 1897. Serial No. 638,243. (No model.)

Claim.—1. An apparatus for the purpose described consisting of a case and hollow cylinders therein, said cylinders having spiral grooves thereon and provided with hollow journals, said case having traveling wiping and cut-off devices which are adapted to successively enter said spiral grooves and freely close the same.

2. An apparatus for the purpose described having cylinders and



wiping and cut-off devices adapted to travel in spiral grooves in said cylinders.

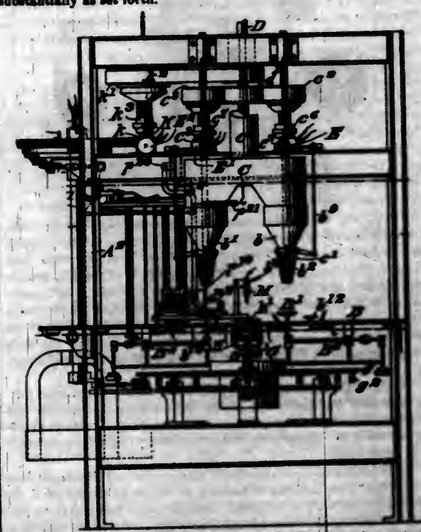
3. A case provided with endless passages and traveling wiping and cut-off devices occupying said passages, in combination with cylinders having spirally-grooved peripheries, portion of said wiping and cut-off devices freely entering said grooves and another portion entering the portions of the passages between the cylinders and walls of the case.

4. A case having endless passages in the walls thereof, movable wiping and cut-off devices adapted to travel in said passages and cylinders having peripheries with spiral grooves thereon, into which latter said devices successively enter to close the same at the adjacent part of the case.

608,412. CONDENSER FOR NITRIC ACID. JEAN V. SKOGLUND, Bayonne, N. J., assignor to himself, and Albert Winter, New York, N. Y. Filed Oct. 19, 1897. Serial No. 655,656. (No model.)

Claim.—1. A condenser for nitric acid having a primary portion of acid-proof material, such as glass or pottery that is not injured by the weak acid, and a secondary portion directly connected to the primary portion and composed of lead, and means for cooling the exterior of the condenser, substantially as set forth.

2. A condenser for nitric acid having a primary portion of acid-proof material, such as glass or pottery that is not injured by the weak acid, and a secondary portion directly connected to the primary portion and composed of a lead pipe bent to form a vertical range of horizontal pipes and a water-supply vessel above the condenser for allowing cooling-water to trickle down over the vertical range of substantially horizontal pipes, substantially as set forth.



608,413. MACHINE FOR FILLING, WEIGHING, AND ASSORTING PACKAGES. ALBERT STEARNS, Trenton, Mich. Filed Nov. 1, 1895. Serial No. 567,663. (No model.)

Claim.—1. A plurality of discharging mechanisms, a movable support for packages and means under the control of the packages for operating the discharging mechanisms, the particular discharging mechanism to be operated being determined by the weight of the package, substantially as set forth.

2. A plurality of discharging mechanisms, a movable support for conducting packages to the discharging mechanisms and means under the control of the packages which enable each package to select the discharging mechanism which is to operate upon it, substantially as set forth.

3. A plurality of discharging mechanisms, a rotary support, scales carried by the support and adapted to receive packages and convey them to the discharging mechanisms, devices carried by the scales for operating the discharging mechanisms, and means for guiding the discharge-operating device to different discharging mechanisms, according to the weight of the package on the scale, substantially as set forth.

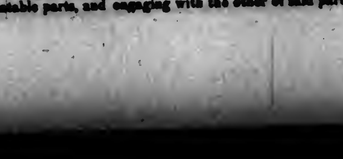
4. A plurality of discharging mechanisms, means located in different planes for setting the different discharging mechanisms in operation, package-supports constructed to assume different levels according to the weight of the package and provided with devices for setting the discharging mechanisms in operation and means for conveying the said package-supports into position where they will engage one or another of said discharge-operating devices according to the planes which they assume under the weights of the packages, substantially as set forth.

5. A plurality of discharging devices, landings for the reception of the articles which they discharge, a rotary package-support for conveying packages opposite said landings, scales carried by said rotary support and adapted to receive the packages to be discharged, guide-fingers carried by the scales, a series of guides with which the guide-fingers engage, means for operating the discharging mechanisms located at different heights and devices carried by the scales for operating the discharge mechanisms, the said guides in conjunction with the guide-fingers serving to direct the said discharge-operating devices of a particular scale to that discharge mechanism only where the package carried by that scale is intended to be landed, substantially as set forth.

6. A plurality of discharging mechanisms, landings for the reception of packages to be discharged, a movable support for conveying the packages to positions opposite the landings, scales mounted on said support for receiving the packages, devices carried by the scales for operating some one of the discharging mechanisms according to the weight of the package, dash-pots, and pistons or plungers connected with the scales in position to enter the dash-pots to bring the scales to a rest at the level determined by the weight of the package, substantially as set forth.

7. A plurality of discharging mechanisms, a rock-shaft for operating said mechanisms, clutches for locking the said mechanisms in and releasing them from operative connections with the shaft, devices located in different planes for throwing the clutches into and out of position to lock the discharging mechanisms to the shaft, means for conveying the packages in position to be discharged and means under the control of the package for engaging some one of the clutch-operating devices according to the weight of the package, substantially as set forth.

8. The combination with the rotary table, the package-carrying scales mounted thereon and means for discharging the packages, of braces carried by the rotary table and means for throwing the braces into position to steady the scales during a portion of the revolution of the table, substantially as set forth.



9. The combination with the package-discharging mechanisms and the rotary table for conveying the packages to the discharging mechanisms, of the scales carried by the table and forming supports for the packages, devices carried by the scales for operating the discharging mechanisms, weights for partially counterbalancing the scales, springs for completing the counterbalance of the scales, and dash-pots for steadying the scales in the positions which they assume, substantially as set forth.

10. In combination, a package-filling hopper, a scale forming a support for the package, a solenoid for starting the feed, said solenoid being under control of the scale which supports the package for stopping the feed-discharging mechanisms, means for conveying the package with its load to the discharge mechanisms and means under the control of the package for operating some one of the discharging mechanisms according to the weight of the package, substantially as set forth.

11. Several discharging mechanisms, a rotary table for conveying packages to the discharging mechanisms, means for imparting to the table a step-by-step movement, a solenoid for starting the table-operating mechanism and an electric circuit under the control of the table-operating mechanism for energizing the solenoid to stop the movement of the table, substantially as set forth.

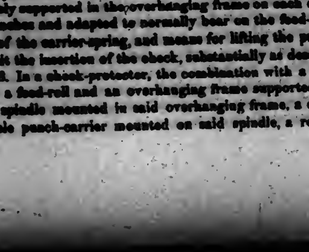
12. In combination, several discharging mechanisms, one for discharging packages of correct weight and others for discharging packages of underweight and overweight, those for discharging packages of underweight and overweight being located upon the opposite sides of the mechanism for discharging packages of correct weight, a rotary table for conveying the packages to be discharged to the discharging mechanisms, scales carried by the said table for receiving the said packages and means under the control of the scales for selecting that discharging mechanism corresponding to the weight of the package carried by the scale, substantially as set forth.

608,414. WINDOW-WASHER. PETER DUNBAR, Toronto, Canada. Filed Aug. 17, 1897. Serial No. 648,598. (No model.)

Claim.—The combination with a brush of a spray-tube provided with plugs in its upturned ends, a tubular drier of frictional material, and a spring-wire extending through the drier and projecting from its opposite ends, said wire designed to be inserted in the plugs in the upturned ends of the spray-tube, substantially as specified.

608,415. SCALE. JESSE H. DUNBAR, Cleveland, Ohio, assignor to the National Computing Scale Company, same place. Filed Mar. 12, 1897. Serial No. 627,627. (No model.)

Claim.—1. The combination of a rotatable scale member and means for rotating it proportionately to the load, with an independently-rotatable dial mounted in axial line with said member, a yielding-spring retractor connecting said dial and member, and acting to return the dial to approximately its proper relative position, and a yielding-spring latching device carried by the dial or one of said independently-rotatable parts and engaging with the other, and acting to cause the dial to come to rest always in the same position relative to the said member, substantially as specified.



2. The combination of a rotatable scale member and means for rotating it proportionately to the load, with an independently-rotatable dial, a yielding-spring retractor which connects said two parts, and a plurality of spring latching-arms secured to one of them and bearing under constant tension upon a plurality of flattened surfaces on diametrically opposite parts of the other of said parts, substantially as specified.

3. The combination of a rotatable scale member and means for rotating it proportionately to the load, with an independently-rotatable dial in the same axial line with the said member, a spiral spring connected at its ends respectively to the dial-frame and member, and a yielding-spring latching device carried by one of said independently-rotatable parts, and engaging with the other of said parts, whereby the dial is always brought to rest in the same relative position, substantially as specified.

4. In a scale, the combination of a rotatable scale-spindle, an indicator rigidly attached thereto, a pinion loosely mounted upon said spindle, and means for rotating the pinion proportionately to the load upon the scale-pan, a yielding-spring device serving as the connection between the indicator and pinion, and a spring latching device which brings the indicator and pinion to rest in the same relative position at all times, substantially as specified.

5. In a scale, the combination of a rotatable scale member, means for rotating it proportionately to the load, an independently-rotatable indicator in axial line with said member, a yielding spring which is rigidly connected at its ends respectively with the said member and the indicator, and a spring latching device for bringing the member and indicator to rest in the same relative position at all times, substantially as specified.

608,416. CHECK-PROTECTOR. LOUIS T. WEBB, Brooklyn, N. Y. Filed June 26, 1896. Serial No. 596,945. (No model.)

Claim.—1. In a check-protector, the combination of a base, an overhanging frame supported on said base and provided with a vertical spindle affixed thereto, a punch-carrier mounted to turn and to reciprocate on said spindle, a spring adapted to force the punch-carrier upwardly, a lever for depressing the punch-carrier, a feed-roll mounted in the base, pressure-rolls placed in operative relation to said feed-roll, and an operative connection between the punch-carrier and said feed-roll for rotating the feed-roll, substantially as described.

2. In a check-protector, the combination of a frame, a depressible punch-carrier mounted on a spindle carried by said frame, a spring placed in engagement with said punch-carrier for lifting the same, pressure-rolls supported in the frame and held normally depressed by the action of the carrier-spring, and means for lifting said pressure-rolls, substantially as described.

3. In a check-protector, a feed and inking roll provided with an absorbent material whereby there is afforded a constantly-changing surface to receive the penetrating-needles.

4. In a check-protector, a feed and inking roll comprising a cylindrical absorbent pad and two metallic caps secured to the ends of the hub of the pad, the said absorbent pad affording a constantly-changing surface for the penetrating-needles and the metallic caps serving as a support for the check.

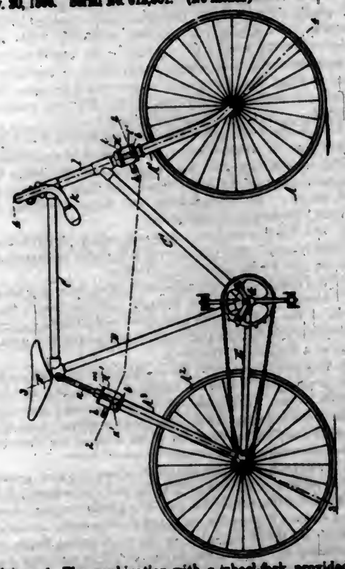
5. In a check-protector, the combination of a base, a frame attached to said base, a feed-roll mounted in said base and having an absorbent surface, a depressible punch-carrier, and a pair of pressure-rolls mounted on independent pivots and supported in the frame and adapted to bear on the feed-roll at the sides of the absorbent pad, substantially as described.

6. In a check-protector, the combination of a base, an overhanging frame supported on said base, and a feed-roll mounted in the base and provided with an absorbent pad, of a spindle mounted in said overhanging frame, a depressible, rotatable punch-carrier mounted on said spindle, a rock-frame supported by the overhanging frame, pressure-rolls mounted on independent pivots carried by said rock-frame and adapted to bear on the feed-roll at the sides of the absorbent pad, and means for lifting said pressure-rolls, substantially as described.

7. In a check-protector, the combination with a base provided with a feed-roll and an overhanging frame supported on said base, of a spindle mounted in said frame, a punch-carrier mounted on said spindle, a spring tending to force said carrier upwardly, an operating-lever pivoted to the spindle and engaging the carrier, pressure-rolls suitably supported in the overhanging frame on each end of the line of punches and adapted to normally bear on the feed-roll by the action of the carrier-spring, and means for lifting the pressure-rolls to permit the insertion of the check, substantially as described.

8. In a check-protector, the combination with a base provided with a feed-roll and an overhanging frame supported on said base, of a spindle mounted in said overhanging frame, a depressible, rotatable punch-carrier mounted on said spindle, a rock-frame sup-

ported in the overhanging frame, pressure-rolls carried by said rock-frame in operative relation to said feed-roll, one on each side of the line of punches, and a connection between the punch-carrier and the feed-roll shaft for turning the latter when the punch-carrier is reciprocated.

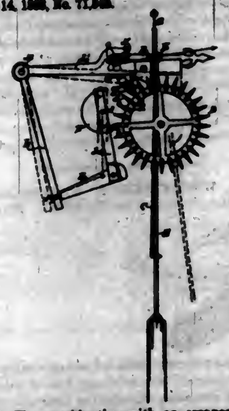


9. In a check-protector, the combination with a base provided with a feed-roll and an overhanging frame supported on said base and provided with a web in its bottom, of a spindle mounted centrally in said web, a depressible punch-carrier mounted on said spindle and provided with notches in its periphery, a spring and guide adapted to engage said notches, pressure-rolls supported in the overhanging frame and adapted to normally bear on said feed-roll, a lever adapted to raise said pressure-rolls and a connection between the depressible carrier and the shaft of the feed-roll, substantially as set forth.

608,417. LAMP-BURNER. JAMES H. WHITE, Brooklyn, N. Y., assignor to the Manhattan Brass Company, New York, N. Y. Filed Sept. 13, 1897. Serial No. 651,402. (No model.)

Claim.—The combination in a lamp-burner with the chimney-holding arms secured to the burner, of separate globe-holding arms formed with integral clips 3, and 4, that are bent around and embrace the spring chimney-holding arms at a point above the chimney-support, substantially as set forth.

608,418. VELOCIPEDE. CORNELIUS P. ARRIANS, Ilion, N. Y., assignor of one-half to Hamit D. Ramsey, Cattaraugus, N. Y. Filed Nov. 20, 1896. Serial No. 612,801. (No model.)



Claim.—1. The combination with a wheel-fork provided at its upper end with a platform, of a vertically-movable seat-carrying frame provided with a corresponding platform and guide-stems having a telescopic connection with the arms of the wheel-fork, a cushion interposed between said platforms for checking the downward movement of said frame, and an auxiliary spring or cushion arranged to check the upward movement of said frame, substantially as set forth.

2. In a velocipede, the combination with the front and rear forks having hollow arms and each provided at its upper end with a platform, of a seat-carrying frame provided at opposite ends with followers arranged above said platforms, respectively, and with guide-rods which slide in the hollow fork-arms, springs applied to said guide-rods and checking the upward movement of the same in the fork-arms, and air-cushions interposed between said platforms and followers, substantially as set forth.

3. In a velocipede, the combination with the front and rear forks having hollow arms provided at or near their upper ends with internal stops or shoulders, platforms arranged at the upper ends of said forks, a seat-carrying frame provided at its front and rear ends with follower-plates and with guide-rods sliding in the hollow fork-arms and provided within the fork-arms with heads or shoulders, springs applied to said guide-rods between their heads and the internal shoulders of the fork-arms, and cushions interposed between said platforms and said follower-plates, substantially as set forth.

608,419. PENDULUM-ESCAPEMENT. FERDINAND RADEMEL, Allenstein, Germany, assignor to Henry H. Keeling, San Francisco, Cal. Filed Oct. 27, 1897. Serial No. 656,610. (No model.) Patented in Germany Nov. 14, 1888, No. 77,948.

Claim.—1. The combination with an escapement-wheel of the oscillatory pendulum-carrier having the transverse arm fixed to and movable therewith, a pin carried by said arm adapted to alternately engage with and disengage from the teeth of the escapement-wheel, an independent weighted bell-crank arm or lever fulcrumed with relation to the escapement and pendulum, a segment having a projecting point adapted to engage with and disengage from the teeth of the escapement-wheel in alternation with the movement of the first-named point, said point being connected by a link with the bell-crank lever and actuated thereby.

2. The combination with a toothed escapement-wheel of an oscillatory pendulum and a carrier having an arm fixed transversely and movable with it, a pin carried by said arm adapted to alternately engage with and disengage from the teeth of the escapement, a second point also adapted to engage with and disengage from the escapement and alternately with the corresponding engagement of the first-named point, a weighted bell-crank lever fulcrumed and connected by a link with the carrier of the second point, said lever having a hook or arm projecting in the plane parallel with the plane of movement of the arm carried by the pendulum, a pin projecting from said arm and engaging with the hook or projection whereby the movements of the two parts are made in unison.

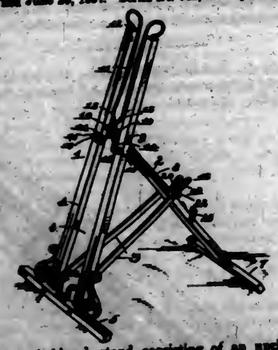
3. In an escapement mechanism, a toothed escapement-wheel having pins projecting from the side of its periphery, an oscillatory pendulum and a carrier having a transverse arm movable with it, a pin carried by said arm adapted to engage with and disengage from the teeth of the escapement-wheel by the oscillations of the pendulum, a second oscillating escapement-point adapted to engage with and disengage from the teeth of the escapement-wheel in alternation with the movements of the first-named point, a weighted bell-crank lever fulcrumed, having one arm connected with the second escapement-point whereby the latter is oscillated in conjunction with the movement of the bell-crank lever, a hook or projection from the other arm of said bell-crank lever, a pin projecting from the arm carried by the pendulum and adapted to engage said hook whereby the movements of the pendulum-arm and the bell-crank lever are made in unison, a beveled or inclined lug or projection upon said arm of the bell-crank lever adapted to be engaged by the pin upon the escapement-wheel at each release of said wheel whereby the impulse is given to continue the movement of the pendulum.

608,420. HOLDBACK DEVICE. OLIVER P. BAKER, Pleasant Ridge, N. Y. Filed Oct. 30, 1897. Serial No. 656,572. (No model.)

Claim.—As an improved article of manufacture, a holdback device for harness composed of links, each of which comprises side arms having eyes, parallel arms, a vertical rigid jaw, separated vertical spring-jaws parallel with the rigid jaw, a swiveled fastening device at one end of the connected links, and a hinged fastening device at the other end, substantially as specified.

608,421. WHEELED DUMPING SCRAPER AND GRADER. WALKER C. BRADFORD, Arbuckle, Cal. Filed June 18, 1897. Serial No. 641,262. (No model.)

Claim.—1. A wheeled dumping-scraper having a bisected pan fastened to a frame carrying a scraper or cutter at its forward end, a spring-pressed lever fulcrumed on the axle of the machine and connected with the forward portion of the pan by a link, and jointed arms connecting the rear and front portions of the pan, a shaft journaled on the machine forward of and parallel to its axle, crank-levers fixed to each end of said shaft and connected with the pan-frame, a spring-pressed lever rigidly fastened to said shaft to raise and depress the front of the pan, and curved segments turnable upon the shaft with chains passing therefrom over guide-pinions to the rear portion of the pan-frame.



2. A wheeled dumping-grader having a bisected pan secured to a containing-frame carrying a scraper or cutter, a spring-pressed lever fulcrumed to the axle of the machine, and having a link connection with the forward portion of the pan, sprocket-wheels on each end of said axle, a shaft journaled on said machine in front of and parallel to said axle, sprocket-segments on said shaft in line with said sprocket-wheels and provided with lugs near their rear ends, chains fastened to the rear ends of said pan-frame and passing over and engaging the teeth of said sprocket-wheels and segments, a spring-controlled hand-lie-bar or lever fulcrumed to said shaft and engaging with a curved notched rack fastened in front of said shaft and extending backward to said axle, cranks and links connecting with the shaft and the forward ends of the pan-frame, and means for rigidly connecting said sprocket-segments and cranks.

3. A combined wheeled dumping scraper and grader having a bisected pan fastened to a containing-frame carrying a scraper or cutter, a spring-pressed lever fulcrumed to the axle of the machine and having a link connection with the forward portion of the pan, a shaft journaled on the beam or pole of the machine forward of and parallel to said axle, crank-levers fixed to each end of said shaft and connected with the pan-frame, a spring-pressed lever rigidly fastened to said shaft, a notched curved rack engaging with a lug on said lever, a brace-bar connecting at its apex with a hook bolted near the forward end of the beam or pole of the machine and pivotally connected at its ends with the forward ends of the pan-frame, sprocket-segments at each end of said shaft having lugs near their rear ends, sprocket-wheels on the axle in line with the said segments, chains fastened to the rear ends of said pan-frame and passing over and engaging the teeth of said sprocket-segments and wheels, a spring-controlled hand-lie-bar or lever fulcrumed to said shaft and engaged with a notched curved rack, cranks and links connecting with the shaft and the forward ends of the pan-frame, a pin-and-hole connection between the cranks and links for adjustably connecting them together, braces extending from the beam or pole of the machine to the axle-cranks provided with steps with which the lugs on the sprocket-segments may contact, and guide-bars on the axle-cranks extending below the top of the pan-frame, to prevent side motion thereof.

4. A dumping scraper and grader consisting of a two-part pan, a frame suspended from the axle of bearing-wheels, hinges by which the two parts of the pan are suspended from said frame and about which they are turnable, lever-arms having their lower ends fixed to the two parts of the pan and their upper ends pivotally united at one side of the pan, a lever fulcrumed upon the machine having a link connecting with the forward edge of one of the pans whereby the movement of the lever acts to separate the pans and dump the load.

5. In a compound grader and scraper, a frame having a share or cutter at the front and a receiving and dumping pan behind said share, a crank-axle to the end of which bearing-wheels are journaled, sprocket-wheels turnable upon said shaft, chains connecting with the rear end of the scraper-frame passing over the sprocket-wheel, segments loosely turnable upon a shaft fixed in front of the main axle and having attachments whereby the chains may be connected therewith so that the turning of the sprockets will raise or depress the rear end of the scraper, movable latches fixed to the sprocket-segments and stops upon the segment-shaft crank-arms with which the latches are engaged when the segments are turned to raise the rear end of the scraper, crank-arms upon the shaft on which the segments are turnable and links connecting said crank-arms with the front of the scraper and a latch-lever and segmental rack for holding the same whereby the shaft may be turned independently of the sprockets to regulate the height of the front end of the scraper.

608,422. BICYCLE-STAND. CHARLES F. BURKHARDT, Buffalo, N. Y. Filed June 30, 1897. Serial No. 643,705. (No model.)

Claim.—1. A bicycle-stand, consisting of an upright or main frame, a brace for supporting the same, and a flexible or self-adjusting clamping device secured to or near the upper end of said upright, said clamping device passing down upon the same some distance from its upper end so as to embrace or clamp the upper and lower members of the bicycle-frame, substantially as set forth.

2. A bicycle-stand, consisting of an upright or main frame, a folding brace having a combined sliding and swinging movement attached thereto, stays or links connecting the brace and the upright, a self-adjusting clamping device secured to the upper portion of said upright, and a self-adjusting clamp secured to the outer face of the brace, substantially as set forth.

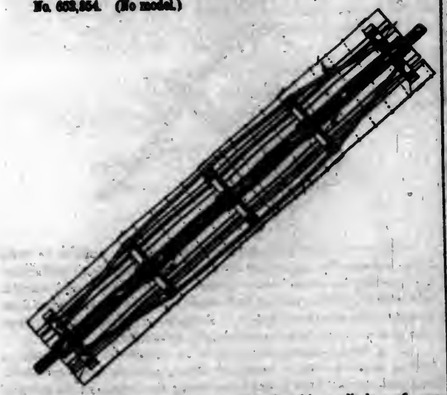
3. A bicycle-stand, consisting of an upright or main frame, a brace for supporting the same, and a self-adjusting clamping device secured to the upper portion of said upright, said clamping device having a clamping portion at its upper end to retain or hold the frame of the bicycle and a clamping portion at its lower end to clamp the tire of the wheel, substantially as set forth.

4. A bicycle-stand, consisting of an upright or main frame, a brace for supporting the same, and a self-adjusting clamping device formed of two pieces of resilient wire, the upper ends of said wires being secured to or near the upper end of the upright, then bent or curved downwardly and offset or bent to contact and form a seat, said contacting portions being bent downwardly and outwardly and secured to the upright, substantially as set forth.

5. A bicycle-stand, consisting of an upright or main frame, a brace for supporting the same, and a flexible or self-adjusting clamping device secured to or near the upper end of said upright, said clamping device having a flaring entrance and passing down upon the upright some distance from its upper end so as to embrace or clamp the upper and lower members of the bicycle-frame, substantially as set forth.

6. A bicycle-stand, consisting of an upright or main frame, a brace for supporting the same, and a clamping device secured to the brace to embrace the upper or lower member of the bicycle-frame, said clamping device being formed of resilient wire and having a central portion 39, laterally-bent portions 40, and upwardly-bent portions 41, said upwardly-bent portions having a flaring entrance, substantially as set forth.

7. A bicycle-stand, consisting of an upright or main frame composed of a base and a pair of upright bars separated by an intervening space said base being offset or set in advance of said bars, a folding



brace or support having a combined sliding and swinging movement and a base or horizontal bar at its outer end, and a link or stay connecting said brace with the upright, substantially as set forth.

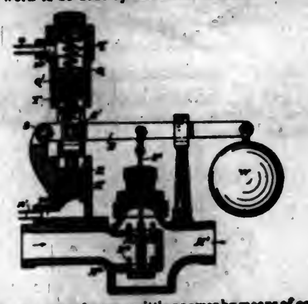
603,423. MOLDING-MACHINE. WILLIS R. BURNS, Syracuse, N. Y. Filed June 14, 1897. Serial No. 640,630. (No model.)

Claim.—In a molding apparatus, a reciprocating piston, the toggle-segment 14, pivoted to its upper end, the toggle-segment 15, the two segments being provided with teeth upon their engaging surfaces, the connecting-links by which the two segments are kept in gear with each other, the operating-shaft 16, which passes through the upper end of the segment 15, and a weighted operating-lever, connected to one end of the shaft, combined with a suitable inclosing frame that is provided with doors, and the slotted guide 20, secured to the side of the frame, substantially as shown and described.

603,424. THRESHING-MACHINE. WILLIAM H. BUTTERWORTH and JOHN BUTTERWORTH, Trenton, N. J. Filed Sept. 24, 1897. Serial No. 653,354. (No model.)

Claim.—1. The combination, with a threshing-cylinder; of a continuous spiral band wound on the periphery of the cylinder and comprising series of close adjacent coils and separated coils arranged alternately, substantially as set forth.

2. The combination, with a threshing-cylinder; of a continuous spiral band wound on the periphery of the cylinder and comprising series of close adjacent coils and separated coils arranged alternately, and threshing-plates secured to the cylinder over the said band and provided with flanges having broad notches and narrow notches fitting over the coils of the band, substantially as set forth.



3. The combination, with a threshing-cylinder, of means for supporting the same comprising close adjacent metallic coils and separated metallic coils wound spirally upon the periphery of the cylinder, substantially as set forth.

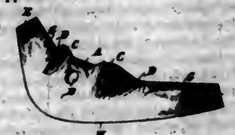
4. The combination, with a threshing-cylinder, of means for supporting the same comprising metallic coils wound spirally on the periphery of the cylinder, and plates secured to the cylinder and provided with notched flanges engaging with the said coils, substantially as set forth.

608,425. GOVERNOR FOR AIR-COMPRESSORS. CHARLES CORNISH, Oakland, Cal., assignor to the Pneumatic Power Company, San Francisco, Cal. Filed Oct. 29, 1896. Serial No. 610,440. (No model.)

Claim.—1. In an apparatus for transmitting power by means of compressed air or other gas or fluid circulating in a closed system at two unequal pressures, both above normal atmospheric pressure, a means for automatically keeping an arithmetical ratio or a constant difference of pressure between the two unequal pressures, said means varying the speed of the compressor so that it will generate, as required, more or less energy for the work to be done by the driven machine.

2. In an apparatus for transmitting power by means of compressed air or other gas or fluid circulating in a closed system at two unequal pressures, both above normal atmospheric pressure, the combination of a compressor, a machine to be driven thereby, air-conduits between the compressor and the machine and containing air at the unequal pressures, and a means for automatically keeping an arithmetical ratio or a constant difference of pressure between the two unequal pressures, said means varying the speed of the compressor in proportion to the work to be done by the driven machine.

3. In an apparatus for transmitting power by means of compressed air or other gas or fluid circulating in a closed system at two unequal pressures, both above normal atmospheric pressure, a governor for keeping an arithmetical ratio or a constant difference of pressure between the two unequal pressures, and regulating the speed of the compressor in proportion to the work to be done by the driven machine, said governor comprising connected pistons of equal pressure areas, acted upon by the unequal pressures, means for counterbalancing the difference in pressure and holding the pistons in equilibrium and means operated by said connected pistons for controlling the compressor-driving medium.



4. In an apparatus for transmitting power by means of compressed air circulating in a closed system at two unequal pressures, a governor for keeping an arithmetical ratio, or a constant difference of pressure between the two unequal pressures, and regulating the speed of the compressor in proportion to the work to be done by the driven machine, said governor having two pistons connected and moving in unison, the pistons being of equal pressure areas, said pistons receiving respectively the pressures of the high and low air-pressures, a weight connected with the pistons for counterbalancing the difference in pressure and holding the pistons in equilibrium, and a valve controlling the supply-pipe leading to the motor which actuates the compressor, said valve being regulated by the movement of the governor-pistons.

5. In an apparatus for transmitting power by means of compressed air circulating in a closed system at two unequal pressures, a governor for keeping an arithmetical ratio or a constant difference of pressure between the two unequal pressures and regulating the speed of the compressor in proportion to the work to be done by the driven machine, said governor having two pistons connected and moving in unison, the pistons being of equal pressure areas, said pistons receiving respectively the pressures of the high and low air-pressures, a weighted lever connected with and operated by the pistons for counterbalancing the difference in pressure and holding the pistons in equilibrium, and a valve controlling the supply-pipe leading to the motor which actuates the compressor, said valve being connected with the weighted lever and regulated by the movement of the governor-pistons.

6. In an apparatus for transmitting power by means of compressed air circulating in a closed system at two unequal pressures, the combination of a compressor, a suitable motor for actuating it, a machine to be driven by the power of the compressed air, two air-conduits between the compressor and the driven machine and containing air at unequal pressures, a governor having two pistons connected and moving in unison and whose pressure areas are equal, a pivoted lever connected and operated by the movement of said pistons and carrying a weight to balance said pistons and hold them in equilibrium, a valve controlling the supply-pipe leading to the motor which actuates the compressor and a valve-stem connecting the valve with said lever whereby it is operated, a low-pressure pipe running from the low-pressure conduit to the low-pressure end of the governor, and a high-pressure pipe running from the high-pressure conduit to the high-pressure end of the governor.

608,426. COTTON-SCRAPER. GABRIEL P. DOWLING, Court, Ala. Filed July 7, 1897. Serial No. 643,720. (No model.)

Claim.—The cotton-scraper herein described, consisting of a central portion A provided with a hole for attachment to the plow-stock and, properly inclined to fit the same, a curved upward and outward projection C on each side of said central portion extending only partially across the scraper, and the rings G beginning at and extended rearwardly in curved lines from said projection, the cutting edge H being arranged in a horizontal plane and formed in crescent shape, the lower half of the scraper between its central longitudinal line and its edge being curved from end to end and presenting a smooth uninterrupted upper surface, substantially as described.

608,427. CANDLE-LAMP FOR PHOTOGRAPHIC DARK ROOMS. EMIL F. GEISSER, New York, N. Y. Filed Feb. 10, 1896. Serial No. 578,638. (No model.)

Claim.—1. The herein-described pocket-lamp for photographers, consisting of a candle-containing tube, a lower baffle thereon, a cap fitted to the upper end of said tube, said cap being expanded at its upper end and reduced contiguous to said expanded portion and also having a projecting lower end, a chimney-holder supported between said lower baffle and expanded top by said projecting portion of the cap, said chimney-holder having openings in its side wall and being formed with a ledge at its lower end, a chimney supported on said ledge, a cap at the top of said chimney, and a baffle secured to said cap and so located with respect to the same as to provide an air-space in the cap around and above the baffle, substantially as described.

2. The herein-described knockdown pocket-lamp for photographers, consisting of a candle-containing tube, a lower baffle for reflected light-rays secured to said tube, a cap secured to the upper end of said tube and having an expanded upper end to form a combined grease-cap and baffle and formed with a shoulder at its lower end, a chimney-holder removably supported between said baffles on said shoulder, said chimney-holder having a ledge at its bottom and openings in its side wall, a chimney supported on said ledge, a removable cap at the top of said chimney, a baffle secured to said cap and so located with respect to the same as to provide an air-space in the cap around and above the baffle, said chimney-holder and chimney being removable together from said tube and adapted to be inserted over the same in inverted position, and a base having an annular recess to receive the end of the chimney when said parts are inverted, substantially as described.

3. In a knockdown photographic lamp, the combination with a illuminant-containing tube, and a base having an annular recess, of a chimney-holder, a chimney attached thereto and a removable cap at the top of said chimney, said chimney-holder and chimney being arranged and constructed to be removed from said tube and slipped over the same in inverted position with the end of the chimney in said recess, substantially as described and for the purposes specified.

4. In a knockdown pocket-lamp, the combination with the illuminant-containing tube having an enlarged supporting-base, of a chimney-holder removably supported on the upper portion of the tube, and a chimney fitted at one end in the holder, said holder and chimney being adapted to be jointly removed from the tube, inverted and fitted over the tube with the other end of the chimney supported on said base, substantially as described.

5. In a knockdown photographic lamp, the combination with the illuminant-containing tube having an enlarged supporting-base, of a chimney-holder adapted to be removably supported on the upper portion of the tube, a chimney fitted at one end in the holder, and a cap removably supported on the other end of the chimney, the construction being such that the cap may be removed from the chimney, the holder and chimney inverted and slipped over the tube and supported by said base, and the cap be inverted and supported in the inverted holder, substantially as described.

603,428. TEMPORARY BINDER. LOUIS M. LESLIE, New York, N. Y., assignor to the William Mann Company, Philadelphia, Pa. Filed Jan. 28, 1897. Serial No. 620,462. (No model.)

Claim.—1. In a binder, the combination of the back pieces, with the levers forming an expansible connection between said back pieces, the single cable cooperating with sheets or leaves to hold them in place, and means for adjusting said cable to hold any desired number of sheets or leaves.

2. In a binder, the combination of the back pieces, with expansible connection between said back pieces, and a single cord for retaining the sheets or leaves in position, and mechanism for tightening said cord uniformly throughout its length, for the purpose described.

3. In a binder, the combination of the back pieces, with the single cable or cord connecting said back pieces and passing through one of them, and means for effectually shortening said cord.

4. In a binder, the combination of the apertured sheets or leaves, of the back pieces, the single cord or cable connected to one of said back pieces and passing through the apertures in said sheets, and means for effectually shortening said cord whereby the back pieces will be drawn together and the sheets clamped thereby.

5. In a binder, the combination of the back pieces and the apertured spindle, with means for turning said spindle, a catch to hold the spindle in any position to which it may be turned, and a cord passing through the aperture in said spindle.

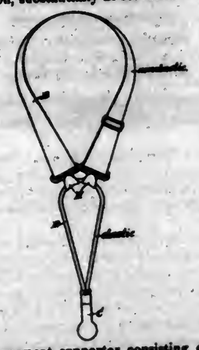
6. In a binder, the combination of the back pieces and the rotatable spindle, with a cord cooperating therewith and wound up by the rotation of said spindle, and connections between said cord and spindle so as to permit the movement of the cord relative to the spindle in order to automatically adjust the cord until the strain on the ends of said cord is uniform.

7. In a binder, the combination of the back pieces, and the cord or cable, attached at its ends to one of said back pieces with the other back piece movable relative to the first back piece, and connections between said second back piece and the cord, the continued operation of which first adjusts said cord so that the tension is uniform throughout its length and then effectually shortens it so as to cause said back pieces to approach each other, substantially as described.

8. In a binder, the combination of the back pieces, with means for connecting said back pieces and holding them in parallelism, a cable connected at its ends to one of said back pieces and passing through the other back piece, and tautening mechanism on said other back piece through which said cable passes, substantially as described.

9. In a binder, the combination of the back pieces, with means for connecting said backs and holding them in parallelism, a cable connected at its ends to one of said back pieces and passing through the other back piece, and tautening mechanism for said cable comprising the spindle *r* and the diagonal aperture Q, all located and operating substantially as and for the purpose described.

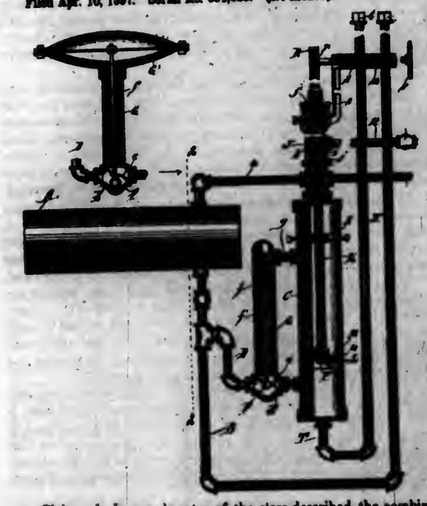
10. In a binder, the combination of the back pieces, with means for connecting said back pieces and holding them in parallelism, a cable connected at its ends to one of said back pieces and passing through the other back piece, and tautening mechanism for said cable comprising the spindle *r*, carrying the ratchet disk R and having the diagonal aperture Q with the dog S, all cooperating substantially as described.



11. In a binder, the combination of the back pieces, with the levers forming an expansible connection between said back pieces, a single cable cooperating with sheets or leaves to hold them between said backs, and means for adjusting said cable to hold any desired number of sheets and said backs unyieldingly, substantially as described.

12. In a binder, the combination of the back pieces, with the single cable or cord connecting said back pieces and passing through one of them, and means for effectually shortening said cable to hold unyieldingly said back pieces and any desired number of sheets, substantially as described.

608,429. WITHDRAWN.



608,430. HOSE-SUPPORTER. JOHN J. HEALEY, Bayonne, N. J., assignor, by direct and mesne assignments, to Mary J. Healey, same place, and Harold Blaney, New York, N. Y. Filed Dec. 28, 1894. Serial No. 532,264. (No model.)

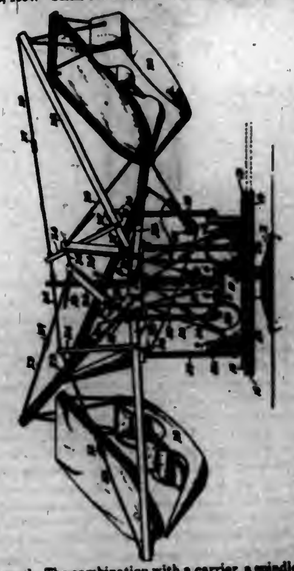
Claim.—1. A hose or garment supporter, consisting of the non-elastic band portion B, the clasp or retaining device, and the elastic loop or cord secured thereto and adjustably connected to the ends of the said band portion, substantially as set forth.

2. A hose or garment supporter consisting of the non-elastic band portion, the elastic loop or triangle secured to the two ends of the said non-elastic band portion and forming an elastic continuation of the said band at *d'* in the interval between the two ends of the said band, and the clasp or retaining device secured to the two ends of the said elastic loop and thereby secured by a yielding connection to each of the two ends of the said non-elastic band B, substantially as set forth.

608,431. CARBURETER. WILLIAM H. PINKNEY, Chicago, Ill. Filed Apr. 10, 1897. Serial No. 631,823. (No model.)

Claim.—1. In a carbureter of the class described the combination with a carbureting-cylinder, of a casing projecting upwardly from the cylinder, and having a pair of stuffing-boxes spaced apart, a vertically-adjustable vapor-induction pipe entering the cylinder through such stuffing-boxes and having lateral apertures located between said boxes, and a service-pipe entering such casing between the stuffing-boxes.

2. In a carbureter of the class described, the combination with a carbureting-cylinder, of a casing projecting upwardly from the cylinder and having a pair of stuffing-boxes spaced apart, of a vertically-adjustable vapor-induction pipe entering the cylinder through the lower stuffing-box and being open to the interior of the casing thereabove and having a stem extending through the upper stuffing-box, and a service-pipe entering such casing between the stuffing-boxes.



3. In a carbureter of the class described, the combination with a carbureting-cylinder, and a vapor-induction pipe entering the cylinder, of an imperforate radial disk at the inner end of the tube and having a pendent annular perforated flange.

4. In a carbureter of the class described, the combination with a carbureter-cylinder, and a vapor-induction pipe entering the cylinder and arranged to have its discharge end submerged within the liquid, of an imperforate radial disk at the inner end of the tube and having a pendent annular flange, and a pendent spiral flange within the annular flange.

5. In a carbureter of the class described, the combination with a carbureter-cylinder, and a vapor-induction pipe entering the cylinder, of a radial disk at the inner end of the tube and having a pendent annular flange, a pendent spiral flange within the annular flange, and pendent baffle-plates crossing the upper portion of the convolute passage inclosed by the turns of the spiral flange.

6. In a carbureter of the class described, the combination with a carbureting-cylinder, a reservoir and a passage connecting the two, of a valve for controlling the passage, means for automatically actuating such valve to maintain the liquid in the cylinder at a uniform level, and a vertically-adjustable vapor-induction tube entering the cylinder.

608,432. CAROUSEL. FRANK C. PRESCOTT, Canton, N. Y. Filed July 20, 1897. Serial No. 645,503. (No model.)

Claim.—1. The combination with a carrier, a spindle and a head, of a series of mast-arms pivoted to the head, a series of carriages or boats each suspended at opposite ends from an adjacent pair of mast-arms, and mechanism substantially as described for reciprocating adjacent mast-arms in opposite directions to impart pitching motion to the boats or carriages, substantially as described.

2. The combination with a carrier, a spindle and a head, of a series of mast-arms fulcrumed in said head to rotate therewith in a horizontal direction, a series of carriages or boats arranged end to end in relation to each other outside of the carrier and each suspended at opposite ends from two adjacent arms of the series of mast-arms, and means substantially as described for giving reciprocating motion in a vertical direction to the mast-arms, said mast-arms being so arranged and combined with each other and the driving mechanism that adjacent arms reciprocate vertically in opposite directions, for the purposes described, substantially as set forth.

3. The combination with a spindle, a carrier and a revoluble head, of a series of mast-arms fulcrumed on the head to reciprocate in vertical planes, a series of carriages or boats arranged in endwise relation to each other outside of the carrier and each loosely suspended at its respective ends from adjacent pairs of mast-arms to sway transversely thereon and to move in vertical directions therewith, and a driving mechanism independent of the spindle and operatively connected with the mast-arms to reciprocate adjacent arms in opposite directions, whereby the carriages or boats are given a pitching motion by the arms and are free to sway horizontally thereon, substantially as described.

4. The combination with a non-rotatable spindle, of a revoluble carrier, a head fitted idly on the spindle, a series of shafts arranged radially on the carrier, a single master-gear common to all the radial shafts and fixed to the spindle to mesh with gears on all of said radial shafts, a series of mast-arms fulcrumed on the head, crank-disks fixed to the outer ends of said radial shafts, vertically-disposed pitmen attached to the crank-disks and to the mast-arms at points beyond their fulcra to sustain the weight of said arms and to impart vertical reciprocating movement thereto, and a series of carriages or boats suspended from the mast-arms, substantially as described.

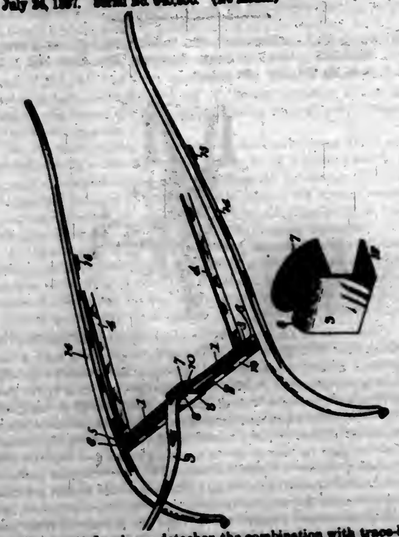
5. The combination with a non-rotatable spindle, of a revoluble head fitted idly on the spindle, a series of mast-arms fulcrumed on the head and provided with upwardly-extending braces, the brace-rods attached to the mast-arms and their braces, the series of coupling-rods attached to the braces of the mast-arms and connecting the latter in pairs, a revoluble carrier, means connecting said head and carrier to insure simultaneous movement of the head with said carrier, a driving mechanism for imparting reciprocating motion to the mast-arms, and carriages or boats suspended from said mast-arms, substantially as described.

6. In a roundabout or carousel, a non-rotatable spindle, a revoluble carrier independent of said spindle, a revoluble head mounted idly on said spindle, and stays or rods attached to the head and the carrier to couple the parts together and insure simultaneous movement of the head with the carrier, combined with mast-arms pivoted to the head, radial shafts journaled on the carrier and operatively connected to the mast-arms, and means for driving said radial shafts, as and for the purposes described.

7. In a roundabout or carousel, a revoluble carrier comprising a driving rim or wheel, a base-plate, the inner and outer rings, and radial spokes united rigidly to all of said parts, combined with a non-rotatable spindle, a foot-base in which the spindle is fixed and supporting said carrier, a revoluble head coupled to the carrier to turn therewith and mounted idly on the spindle, mast-arms pivoted in the head, radial shafts operatively connected to the mast-arms, and means for driving said radial shafts, as and for the purposes described.

8. The combination with a non-rotatable spindle, of a revoluble carrier, a revoluble head mounted on said spindle to rotate idly thereon, a series of mast-arms fulcrumed on the head, a series of upright posts 39, stepped on the carrier and attached to the head outside of the fulcra connection between the latter and the mast-arms to sustain said head against the weight or load thereon, a series of stays joined to the head and carrier, the carriages or boats suspended from the mast-arms, and means for reciprocating said mast-arms, substantially as described.

9. In a roundabout or carousel, the revoluble head flanged and slotted to receive the mast-arms, and bearing-blocks united to said head, within the slotted flange thereof combined with mast-arms fitted in the slotted flange of the head and pivoted to the bearing-blocks thereof within the slotted flange to rest thereon when lowered, a revoluble carrier, and means mounted on said carrier for imparting reciprocating motion in a vertical direction to the mast-arms, substantially as described.



10. In a roundabout or carousel, the combination of a fixed spindle, a revoluble carrier having a ball-bearing on the spindle, a revoluble head also having a ball-bearing on a shouldered part of the spindle to rotate idly thereon, means for uniting the head and carrier together to insure simultaneous rotation to said parts, a series of mast-arms pivoted to the head, boats or carriages suspended from the mast-arms, a master-gear fixed to the spindle, a series of radial shafts journaled on the carrier and geared directly to the master-gear, and pitmen connecting the radial shafts and the mast-arms, for the purposes described, substantially as set forth.

608,433. DRAFT-EQUALIZER. BENJAMIN F. RUSSELL, Pandora, Kans. Filed Nov. 6, 1897. Serial No. 657,894. (No model.)

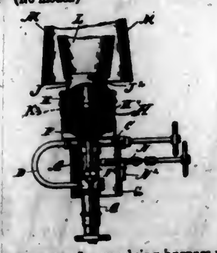
Claim.—In a draft-equalizer, the combination of a draft-beam, the front transverse bar secured to the draft-beam near one end and extending from both sides of the same, the rear transverse bar extending from one side of the draft-beam and terminating at its outer end in rear of the center of the front transverse bar, pulleys mounted on the ends of the front transverse bar and on the outer end of the rear transverse bar, a draft-chain arranged on the pulleys, double-trees connected with the ends of the chain, the brace 15 arranged at an angle to the draft-beam and extending rearward from one side of the same and designed to be connected with the frame of a binder, and the brace 16 crossing the draft-beam and extending from the outer end of the rear transverse bar to the brace 15, substantially as described.

608,434. HORSE-DETACHER. JAMES SEALEY, Scottsborough, Ala., assignor of one-half to Robert H. Shelton, same place. Filed July 24, 1897. Serial No. 645,800. (No model.)

Claim.—1. In a horse-detacher, the combination with trace-bars loosely connected at their outer extremities to a whiffletree, of a trace-bar holder having an open-ended seat for the reception of the trace-bars, said seat being provided with a rearwardly and upwardly inclined front wall, and a forwardly and upwardly inclined rear wall terminating shortof the plane of the front wall, and having a rounded upper edge forming a bearing, and a flexible releasing-strap extending to slide over said bearing, under the contiguous extremities of the trace-bars and over the elevated upper edge of the front wall, and terminally attached at a point in front and outside of the seat, substantially as specified.

2. In a horse-detacher, the combination with trace-bars loosely connected at their outer extremities to a whiffletree, of a trace-bar holder, constructed of a flat blank of metal and having an open-ended seat for the reception of the contiguous alined extremities of the trace-bars, said seat having an upturned rearwardly-inclined front wall consisting of a terminal extension of the blank, and an upwardly and forwardly inclined rear wall consisting of a doubled intermediate portion of the blank and having a rounded upper edge forming a bearing, said rear wall being rearwardly convexed and terminating below the plane of the upper edge of the front wall, and a flexible releasing-strap extending forwardly over the bearing at the upper edge of the rear wall, under the contiguous extremities of the trace-bars, over the upper edge of the front wall and to a point of attachment in front and outside of the seat, substantially as specified.

3. The herein-described sheet-metal holder for trace-bars, the same consisting of a blank of flat metal doubled upon itself at an intermediate point to form the rear wall 8 of the trace-bar seat, having the front arm of the doubled portion extended horizontally forward to form the trace-bar-seat floor, and then terminally upturned to form the rearwardly-inclined front wall 7 of the trace-bar seat, said front wall extending above the plane of the rear wall; and having the rear arm of its doubled portion extended vertically downward and terminally forward to form a horizontal ear, said ear and the floor of the seat having alined openings for the reception of the pivot-bolt of a whiffletree, substantially as specified.



608,485. SKATE. JOHN B. STEELE, Sandy Valley, Pa., assignor of one-fourth to Mathew Smith, same place. Filed Mar. 13, 1897. Renewed Jan. 20, 1898. Serial No. 667,497. (No model.)

Claim.—In a skate, the combination of the heel-piece, the threaded rod passing through the same having adjusted nut behind

the heel-piece and rack-teeth in front of the heel-piece, the toe-clamp secured to the front end of the threaded bar, the slidable upright bar on the threaded rod having its point engaging the front of the heel, and the pawl pivoted in said upright bar and engaging the rack-teeth of the threaded bar, all substantially as set forth.

608,486. APPARATUS FOR CONVEYING AIR AND VAPOR TO BURNERS. Joseph Stubbes, Covington, Ky. Filed Feb. 5, 1897. Serial No. 622,139. (No model.)

Claim.—1. In an apparatus for supplying burners with fuel, the combination with a generator, of means for heating the same, a tube adapted to receive commingled air and vapor, an upwardly-extending service-pipe adapted to receive the discharge of air and vapor from said tube, and means for heating said pipe, substantially as described.

2. The combination with a gasolene-burner and a generator adapted to be heated thereby, of a commingling-tube, an upwardly-extending service-pipe for conveying the commingled air and vapor, a tube surrounding said service-pipe and adapted to receive heated products of combustion from said burner and to conduct said heated products in contact with the said service-pipe whereby the contents of said service-pipe become heated and rise and are prevented from condensing, substantially as described.

3. In an apparatus for supplying burners with fuel-vapor and air, the combination with a generator and means for heating the same, a service-pipe leading upward from above said generator and adapted to convey the commingled air and vapor, a tube surrounding the service-pipe, located over the generator-heater and adapted to receive the surplus heat from said heater, and to convey it in contact with the exterior of said service-pipe, for heating the contents of said service-pipe, substantially as described.

4. The combination of a generator, means for heating the same, a receiver, and a tube having an orifice located therein for forcibly delivering commingled air and vapor to the receiver, means for heating the receiver, a service-pipe mounted vertically over said receiver and communicating therewith, and a tube inclosing the said service-pipe and adapted to convey heat from said heating means along the outside of said service-pipe, substantially as described.

5. In an apparatus for supplying burners with fuel-vapor and air, the combination with a generator and means for heating the same, of a service-pipe substantially upright and adapted to convey the hydrocarbon vapor from said generator commingled with air, a tube surrounding the said service-pipe, means whereby heat from said generator is caused to pass through the said tube and heat the contents of the service-pipe to cause them to rise and prevent condensation, substantially as described.

6. The combination of a gasolene-generator having a needle-valve whose chamber is connected with said generator and means for heating said generator, a commingling-tube, means for separating the products of combustion of said generator-heater from the contents of said commiagling-tube, a delivery-pipe leading upward from said commiagling-tube and means for conducting heat from the generator-heater along the exterior of said delivery-pipe, heating the same and causing the mixture in said delivery-pipe to rise and preventing condensation, substantially as described.

7. The combination with a gasolene-generator having a subburner for heating the same, of a needle-valve whose chamber is connected with said generator, a commingling-tube adapted to commingle air with the vapor from said valve, a delivery-pipe leading upward and adapted to convey the air and vapor from said commingling-tube and means whereby the heat from the subburner is caused to heat the contents of the delivery-pipe for causing them to rise and preventing condensation, substantially as described.

8. In an apparatus for supplying burners at a higher level than the needle-opening with vapor and air, a vapor-generator, and means for supplying a subflame thereto, the receiver H, located above the generator, and receiving at its lower part vapor under pressure from the delivery-orifice F, and also having a direct communication with the fresh external air whereby this fresh air may enter for mixture with the vapor from the generator the receiver H being exposed to the subflame, and an exit for commingled air and vapor, from the receiver to the service-pipe system, substantially as and for the purposes specified.

9. In an apparatus for supplying burners with illuminating vapor and air, a vapor-generator, means for supplying a subflame thereto, the receiver H, located so as to be heated from the subflame, and adapted to receive at its lower portion a stream of vapor directed vertically upward, the receiver H having an opening for receiving air to be commingled with the vapor, and a tube K, located over the inlet F, and establishing communication between the receiver H and the service-tube L, substantially as and for the purposes specified.

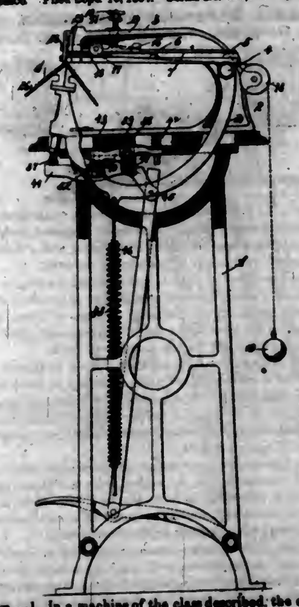
10. The combination of the generator, means for supplying a subflame thereto, receiver H, exposed to the subflame, vapor-delivery pipe to the receiver, at the lower portion thereof, the service-pipe L, with which the receiver is in communication and the auxiliary tube M, surrounding the service-tube L, and extending approximately to the receiver, said tube M being open at the bottom and receiving the heated air and products of combustion of the subflame, substantially as and for the purposes specified.

11. The combination of the generator, means for supplying a subflame thereto, receiver H, exposed to the subflame, vapor-delivery pipe to the receiver, at the lower portion thereof, and the tube K in the receiver above vapor discharge or supply orifice F, and the tube L, above the receiver, and receiving the commingled vapor and air from the latter, for the service-pipes, and the tube M, and the service-tube L, the tube M receiving the heated air and products of combustion from the subflame, and conveying them into contact with the service-pipe, substantially as and for the purposes specified.

12. The combination of a generator, means for heating the same, a receiver H above, and having a direct communication with fresh external air whereby this air may enter for mixture with the vapor from the generator and a tube having orifice F located therein for forcibly delivering under pressure vapor to the receiver, means for heating the receiver H, and a connection between the receiver and the service-pipe, substantially as and for the purposes specified.

13. In an apparatus for supplying burners with fuel-vapor and air, a generator, means for heating the latter, a delivery vapor-pipe having a small orifice F, a receiver, through which the forcibly-ejected vapor passes, and adapted to supply air thereto, means for heating the receiver, a receiving-pipe in line with the stream of vapor and adapted to receive this vapor and heated air from the receiver, and a service-pipe connected with said receiving-pipe, substantially as and for the purposes specified.

608,487. PLOW ATTACHMENT. Reuben Whitman, Vernon, La. Filed July 13, 1897. Serial No. 644,413. (No model.)



Claim.—1. In combination with a standard or foot provided with a shovel, a clamp having vertical and lateral adjustable connection with the standard, a vertical blade, and means for adjustably connecting the blade with the clamp, substantially as described.

2. In combination with a standard or foot bearing a shovel, a clamp having vertical and lateral adjustable connection with the standard, a vertical blade tapering from its upper to its lower end and having its front edge sharpened, and means for adjustably connecting the blade with the clamp, substantially as set forth.

3. An attachment for plows and cultivators, comprising a clamp having a longitudinally-slotted plate, a blade having a tang at its upper end, and a bolt passing through an opening in the tang and through the aforesaid slotted plate and adapted to secure the blade in an adjusted position, substantially as set forth.

4. An attachment for the purposes set forth, comprising front and rear longitudinally-slotted plates, a clamp-bolt passing through the slots of the said plates, a blade, and means for adjustably connecting the blade with one of the aforesaid slotted plates, substantially as described.

608,488. STAPLE DRIVING AND CLENCHING MACHINE. Valentine Zwiesler, Philadelphia, Pa., assignor to Samuel J. Yarger, same place. Filed Sept. 10, 1897. Serial No. 651,174. (No model.)

Claim.—1. In a machine of the class described, the combination with a staple driving mechanism, of an upwardly-moving table, mechanism for raising the table, a staple-clenching mechanism located below the table, and means for actuating the staple-clenching mechanism after the table has ceased its upward movement actuated by the continued movement of the table-raising mechanism, substantially as shown and described.

2. In a machine of the class described, the combination with a moving or vibrating magazine for holding the staples, of a stationary staple-driver or plunger, an upwardly moving or vibrating table, mechanism for raising the table, and means for clenching the protruding ends of the staples after they are driven actuated by the continued movement of the table-raising mechanism, the driving of the staples being accomplished by the upward movement of the table and the clenching by positively-actuated clenching mechanism, substantially as shown and described.

3. In a machine of the class described, the combination with a magazine or means for holding the staples to be driven, of a staple-driver or plunger, a moving or vibrating table, mechanism for moving the table, and means for clenching the staples actuated by the continued movement of the table-moving mechanism, substantially as shown and described.

4. In a machine of the class described, the combination with a magazine or means for holding the staples to be driven, of a staple-driver or plunger, a moving or vibrating table, mechanism for moving the table, and means for clenching the staples after being driven located below and carried by the table and actuated by the continued movement of the table-raising mechanism, the driving being accomplished upon the upward movement of the table, and the clenching by positive action of the clenching means or mechanism, substantially as shown and described.

5. In a machine of the class described, the combination with a suitable supporting-frame having a bar B secured thereto, of a pivoted staple-carrying magazine-bar C, a pivoted bar D, carrying a table, and means carried by the bar D, for clenching the staples substantially as shown and described.

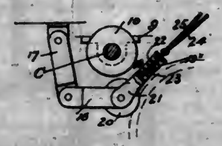
6. In a machine of the class described, the combination with a suitable supporting-frame, of a staple carrying magazine-bar C and a pivoted bar D carrying means for clenching the staples after being driven, the magazine-bar C and the bar D being pivoted upon the same point, substantially as shown and described.

7. In a machine of the class described, the combination with a suitable supporting-frame, of a bar B provided at the free end with a staple-driving plunger 25, a staple-carrying magazine-bar C pivoted to the bar B and provided with a slotted face-plate 30, means for normally forcing the free end of the magazine-bar C away from the free end of the bar B, a bar D pivoted to the bar B and provided with clenching mechanism for clenching the staples after being driven, and means for moving the bar D so as to drive the staples by the forcing upward by the bar D of the bar C and for clenching the staples after they are driven, substantially as shown and described.

8. In a device of the class described, the combination with a suitable supporting-frame, of a staple-carrying magazine-bar C pivoted thereto, and a screw 10 for limiting the downward movement of the bar C, substantially as shown and described.

9. In a device of the class described, the combination with a bar B provided with a staple-driving plunger 25, of a staple-carrying magazine-bar C, a pivoted bar D, a table and a staple-clenching mechanism carried by the bar D, means for forcing the bar D upward so as to compress the book or pamphlet to be bound between the table and the end of the bar C, and for continuing the upward movement of the table so as to force the free end of the bar C upward and drive the staple, and means for clenching the staples when driven, substantially as shown and described.

10. In a device of the class described, the combination with a bar B provided with a staple-driving plunger 25, of a pivoted bar D, a table and a staple-clenching mechanism carried by the bar D, a pin 52 in the bar D, a lever 44 having the slide-face 49, the entrant hollow 50, and hammer-face 51, and means for actuating the lever 44, substantially as shown and described and for the purposes set forth.



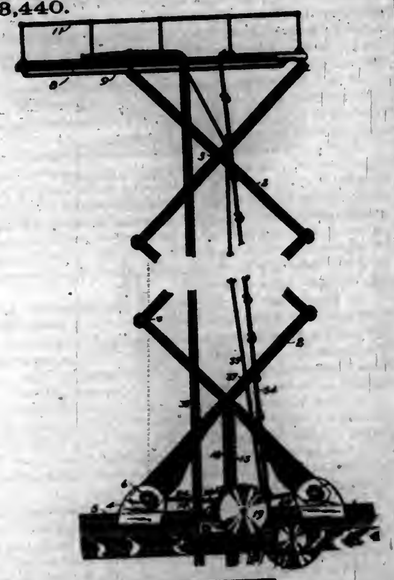
11. In a device of the class described, the combination of a bar B having a staple-driving plunger 25, of a pivoted staple-carrying magazine or bar C, a pivoted bar D, a table and a staple-clenching mechanism carried by the bar D, an adjustable lever 40 and a lever 44 pivoted to the lever 40, substantially as shown and described and for the purposes set forth.

12. In a device of the class described, the combination of a bar B provided with a staple-driving plunger 25, a pivoted bar D, a table and a staple-clenching mechanism carried by the bar D, means for clenching the staples after being driven, and means for regulating the point of the upward movement of the table at which the staples are clenched, substantially as shown and described and for the purposes set forth.

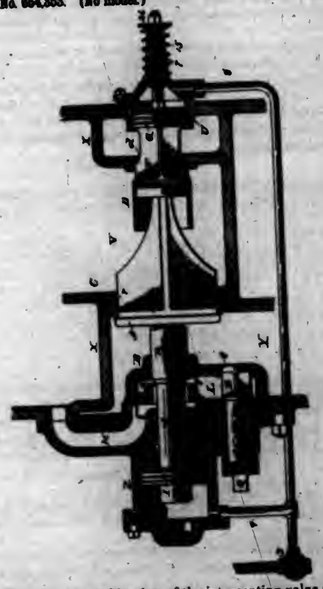
13. In a machine of the class described, the combination with a stationary staple-driving plunger, of a moving staple-carrying magazine-bar, a moving table and staple-clenching mechanism, and means for locking the moving staple-carrying magazine-bar and staple-driving plunger in the extreme clenching position so as to prevent accidental feeding of the staples, substantially as shown and described.

14. In a device of the class described, the combination with a stationary driving-plunger, of a moving staple-carrying device or magazine, a bar D, a bar 27 reciprocating in the bar D and provided with a flattened portion 34' registering with a slot or opening 35' in the end of the bar D, substantially as shown and described and for the purposes set forth.

608,489. CAR-BRAKE. Augustus H. Bowley, South Williamsport, Pa. Filed Dec. 28, 1897. Serial No. 663,907. (No model.)



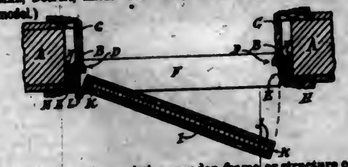
Claim.—In a car-brake, the combination with the car-wheel and its tread-face, and the shaft journaled under the car, and provided with a friction-pulley and the brakes connected to said shaft, of the jointed arms 17, 18, the friction-roller 20, and means to move the friction-roller into contact with the friction-pulley and the car-wheel.



608,440. FIRE-ESCAPE. Salvatore Catapano and Nicholas Tacconi, Birmingham, Ala. Filed Sept. 4, 1896. Serial No. 604,507. (No model.)

Claim.—In a fire-ladder, the combination with sets of lazy-tongs adapted for vertical extension, of guiding devices adapted to permit a sliding movement of the lower ends of the lowermost levers of the lazy-tongs, rack-bars connected to the central pivotal points of the lowermost pairs of levers of said lazy-tongs, said rack-bars having grooves, fixed ribs received loosely in said grooves, winding-drums, cables connecting one winding-drum with the sliding ends of the levers on one side of the lazy-tongs, a cable connecting the other drum with the other levers, and gearing meshing with the rack-bars and connected to the winding-drums whereby the pivotal points of the levers of the lazy-tongs are pushed upward simultaneously with the drawing together of the sliding ends of said levers.

608,440.



608,441. COMPOUND-ENGINE VALVE DEVICE. BENJAMIN F. C. DAVIS, Richmond, Va., assignor to the Richmond Locomotive and Machine Works, same place. Filed Apr. 14, 1894. Renewed Oct. 7, 1897. Serial No. 654,353. (No model.)

Claim.—1. The combination of the intercepting-valve and actuating-piston independent of said valve and of the admission-valve, and the valve E controlling the flow of live steam to the low-pressure section of the receiver, and provided with means for locking it in its closed position, substantially as set forth.

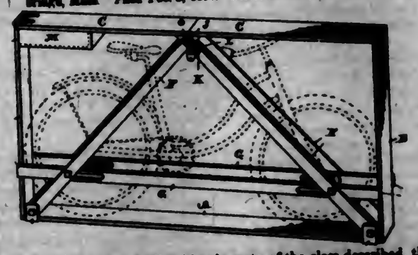
2. The combination of the live-steam passage H, a chamber L communicating therewith through a port, a piston controlling said port and arranged to actuate an intercepting-valve, and a reducing-valve controlling a port communicating with the chamber L, said valve consisting of the piston E having differential faces, and adapted to be closed by overbalancing pressure in chamber y, substantially as described.

608,442. FIRE-RESISTING FRAME AND DOOR. ALPHONSE DE MAN, Detroit, Mich. Filed July 3, 1896. Serial No. 598,047. (No model.)

Claim.—1. A fire-resisting wooden frame or structure consisting of an interior wooden core, a covering of fireproof material inclosing it to prevent access of air for combustion, and a finishing-facing on the exposed portions of the insulating material.

2. The combination with a fireproof wall, having a door-opening therein, of a wooden door-frame, formed of a core of wood, a fireproof insulating-sheathing inclosing the core of wood, an exterior wood finish on the core, and a practically fireproof door within the frame, substantially and for the purpose set forth.

3. The combination with a fireproof wall, having a door-opening therein of a wooden door-frame, consisting of the core B, B', B'', formed of wood, inclosed within a fireproof insulating-sheathing, and the face-jambs, D E vessored on the core admitting, to match any kind of wood, and a practically fireproof door therein, substantially, and for the purpose set forth.



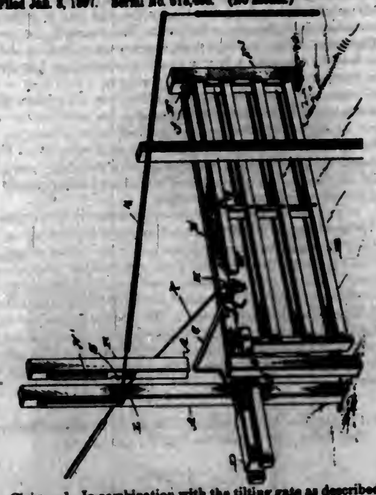
4. In a fire-resisting door-frame composed of an insulated wooden core, and a wooden facing, the rabbet-strips E *e* vessored on a fire-protected core, admitting to let in the hardware without damaging the fireproof sheathing, also to accommodate any variation of the door by altering the thickness of the rabbet-strips.

5. Wooden, fire-resisting, doors, comprising in combination an insulated core made of wood, inclosed by a fireproof insulating-sheathing extending unbroken over the faces, and the edges to exclude air for combustion, and a wooden finishing-facing thereon.

6. In a fire-resisting door, the combination with a wooden core, an insulating-sheathing inclosing the core (to the exclusion of air for combustion) a wooden facing on the faces of the core, and the strips K, (on the edges) admitting of letting in the hinges, and to fit and refit the door without disturbing the fireproof sheathing.

7. In a fire-resisting door, composed of an insulated wooden core, covered with wooden facing on each side the wooden strip K, running all around the door, covering the edges, and admitting of the door being adjusted, without affecting the fireproof sheathing of the core.

608,443. FOLDING BICYCLE-CRATE. MILES H. DUNBAR, Stockbridge, Mass. Filed Feb. 3, 1897. Serial No. 621,613. (No model.)



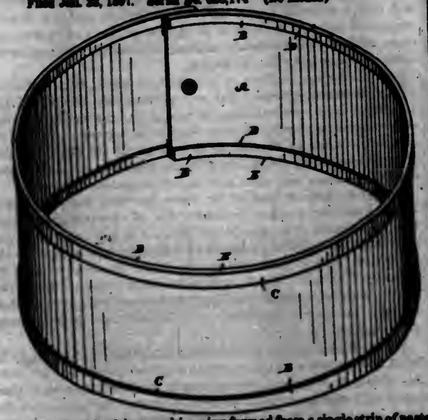
Claim.—1. In a folding bicycle-crate of the class described, the combination with the main frame, of foldable braces hinged thereto and fitted against and secured to the under side of the top, a side bar upon either side of said crate movably connected to said braces and having its ends detachably extended to overlap the edge of the vertical end pieces of the main frame.

2. In a folding bicycle-crate, the combination of folding sections and side braces, vertically-disposed interlocking parts D as shown, secured to the under side of said sections, a bolt adapted to pass through said interlocking parts and side braces in a manner to lock them together.

3. In a bicycle-crate of the class described, the combination with the uniting section, of a bolt to secure them together, a nut for said bolt and provided with a hinged hasp, means to prevent the removal of said nut or bolt.

4. In a bicycle-crate of the class described, the combination with the uniting sections, of a bolt to secure said sections together, a nut provided with a hasp to secure said bolt in position, means for engaging and locking said hasp to prevent the turning and detaching of the nut or bolt.

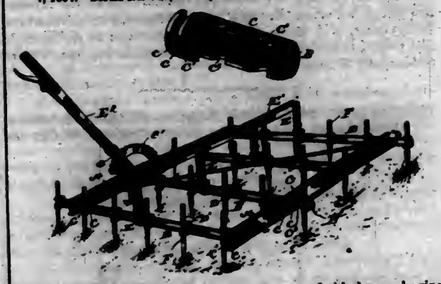
608,444. TILTING GATE. WILLIAM T. FOSTER, Bozeman, Mont. Filed Jan. 8, 1897. Serial No. 618,468. (No model.)



Claim.—1. In combination with the tilting gate as described, the crank-lever, mounted between the upper rails thereof, a latch-rod connected to one of the crank portions, an angle-lever having one end secured to the second crank portion, its other end secured to the upper stripe of the gate, the pivoted operating-lever, the rod K secured to one end thereof, and the link carrying a pulley journaled therein, adapted to travel on the said angle-lever, and having connection with the rod K, whereby the gate may be raised or closed, substantially as described.

2. In combination with the gate, the angle-lever having recesses, one at its angle, and one at its forward end, the shouldered link, and friction-pulley mounted therein, and the operating-lever for raising the link, substantially as shown and described.

3. In combination with the tilting gate, mounted as described, the pivoted catch carried on the gate-post, the angle-plate pivoted to said catch, one of the angles of the said plate extending behind the rear edge of the gate-post, and the operating-lever having a hooked end and connected to the gate-lifting mechanism, the said hook adapted to raise the angle-plate to tilt the catch, as the outer end of the operating-lever is pulled down, substantially as shown and described.



608,445. HAT-PACKING RING. LIBBY T. HALLOCK, Danbury, Conn. Filed Jan. 20, 1897. Serial No. 620,174. (No model.)

Claim.—1. A hat-packing ring formed from a single strip of pasteboard, the upper and lower edges of which are reinforced by turning the stock over flat upon both the in and out side thereof, substantially as shown.

2. A hat-packing ring or stay, the edge of which is laid over flat upon one side, and then said flat doubled edge turned backward to form a flat top surface, as shown.

608,446. HARROW. JOHN I. HOLT, South Bend, Ind. Filed May 7, 1897. Serial No. 635,580. (No model.)

Claim.—1. The combination in a harrow of side beams having circular openings and transverse U-shaped tooth-bars passing loosely through said openings; with grooved plugs C fitted in the channels of the transverse tooth-bars and having enlarged heads C' on one end provided with flanges *c*, *c*, adapted to embrace the edges of the openings in the beam and prevent longitudinal movement of the plug and bar, and means for securing the plugs in the bars, all constructed and arranged to operate substantially as and for the purpose described.

2. The combination in a harrow, of the perforated and notched side beams, and transverse tooth-bars adapted to rotate in openings in said side beams; with rotatable retaining-plugs as C having flanged heads C' fitted in said openings and to said tooth-bars and having notches *c* in their bodies adapted to coincide with notches in the beam, and tooth engaging the coincident notches in the beams and plugs, and secured thereto, all substantially as and for the purpose set forth.

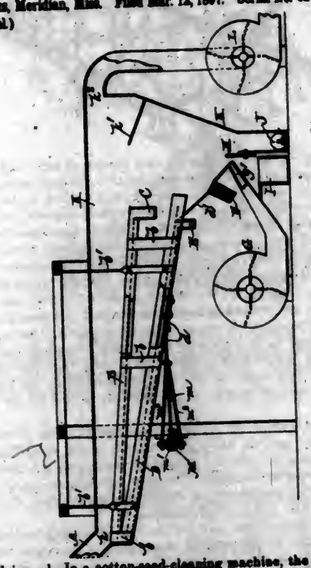
3. In a harrow the combination of the tooth-bar U-shaped in cross-section; and the harrow-tooth; with a clip extending above and below said bar, one part of said clip being bent and terminating in a bolt which is threaded on its outer end and the other part of said clip being provided with a lip d^{11} on its rear end, all substantially as and for the purpose described.

4. In a harrow the combination of a tooth-bar provided with a series of teeth; of the two-part clips extending above and below the harrow-bar, each of said clips having eyes in its rear ends to receive said teeth and provided at their front ends with inner curved surfaces adapted to engage the tooth-bar, and one part of the clip having a threaded end adapted to engage an eye on the other part of the clip, all substantially as described.

5. The herein-described clip consisting of the lower part D having eye *d*, and upturned threaded front end D^4; and the upper part D' having rear eye *d'* and a front eye for the passage of end D^4, and a depending lug d^{11}, and the nut D^5, all substantially as described.

6. In a harrow the combination of the side beams A, A, and transverse parallel notched tooth-bars B passing loosely through openings in said beams; with the retaining-plug C fitted to the tooth-bars, provided with head C', and flanges *c*, *c*, which embrace the edges of the opening in the side beams; the harrow-tooth F secured in coinciding notches in the tooth bars and plugs and the clip D, D', for securing the teeth in place, all constructed and arranged substantially as and for the purpose described.

608,447. APPARATUS FOR DRAINING STARCH. JOHANNES HOMMARSUM, Hamm, Germany. Filed June 10, 1896. Serial No. 594,970. (No model.)



Claim.—1. In combination in a filtering apparatus, the trough, a band extending therein to receive the sediment, said band being attached at its ends, a carriage movable along the trough and having an elevated support for the band to lift the same on one side and to deposit the sediment on the other side of said support, and the conveyer on the carriage for moving the material away, substantially as described.

2. In combination the trough, the band extending therein and fixed at its ends, the carriage having a roller over which the band passes, a roller O to grip the band in connection with the carriage-roller, the conveyer on the carriage, a scraper for removing the sediment from the band and to deposit the same at the conveyer, and means for rotating the roller, substantially as described.

3. In combination the trough, the band fixed at its ends and extending along the trough, the carriage movable along the trough, the roller on the carriage, the chain and chain-wheels on the carriage and trough, the scraper for removing the sediment from the band and for depositing it at the conveyer, and the conveyer on the carriage, said roller and conveyer being rotated by the chain and chain-wheels, substantially as described.

608,448. MACHINE FOR CLEANING COTTON-SEED. JOHN A. LEWIS, Meridian, Miss. Filed Mar. 12, 1897. Serial No. 627,168. (No model.)

Claim.—1. In a cotton-seed-cleaning machine, the combination with an inclosing casing, of a pair of screens arranged one above the other, the upper screen being of coarse mesh to allow the cotton-seed to drop upon the lower screen while the bolls or husks will be retained by the upper screen, a transverse receptacle or trough at the lower end of the upper screen and connected thereto for collecting the bolls and conveying them outside the casing, the lower screen being of fine mesh to support the cotton-seed and to permit the grit and other foreign substance to fall through the said screen, an inclined floor immediately beneath the lower screen and connected thereto to receive said grit, and a transverse trough or receptacle at the lower end of said floor and connected thereto to collect the said grit and convey it outside the casing, means for shaking the said screens, floor and troughs to facilitate the separating operation, a stationary inclined floor to receive the cotton-seed directly from the lower end of the lower screen, a magnet in said floor to attract and remove any metallic particles, a blast-fan adapted to deliver a blast across the path of the cotton-seed at the lower end of the said floor, an adjustable slide opposite the said blast, a conveyer for receiving the cotton-seed carried over the said slide by the blast, an exhaust-fan for withdrawing dust-laden air from the casing and a baffle-plate to prevent the possibility of cotton-seed being carried off by the suction, substantially as described.

2. In a cotton-seed-cleaning machine, the combination with an inclosing casing, of a pair of screens arranged one above the other, the upper screen being of coarse mesh to allow the cotton-seed to drop upon the lower screen while the bolls or husks will be retained by the upper screen, a transverse receptacle or trough at the lower end of the upper screen for collecting the bolls and conveying them outside the casing, the lower screen being of fine mesh to support the cotton-seed and to permit the grit and other foreign substances to fall through the said screen, an inclined floor immediately beneath the lower screen to receive the said grit, and a transverse trough or receptacle at the lower end of said floor to collect the said grit and convey it outside the casing, means for shaking the said screens and floor to facilitate the separating operation, said means comprising a flat spring-bar bolted at one end to the said screens, a yoke secured at its other end, an eccentric engaging said yoke, the said yoke being provided with lateral projections, rods secured at one end to said lateral projections upon the yoke and fastened at their other ends to said flat spring-bar whereby the said bar is stiffened and strengthened at the end adjacent to the eccentric, the bar being sufficiently flexible to allow it to accommodate itself to the movements of the eccentric, a floor to receive the cotton-seed directly from the lower end of the lower screen, a magnet in said floor to attract and remove any metallic particles, a blast-fan adapted to deliver a blast across the path of the cotton-seed at the lower end of the said floor, an adjustable slide opposite the said blast, a conveyer for receiving the cotton-seed carried over the said slide by the blast, an exhaust for withdrawing dust-laden air from the casing, and a baffle-plate to prevent the possibility of cotton-seed being carried off by the suction, substantially as described.

3. In a cotton-seed cleaner, the combination with a suitable outer inclosing casing, of vibrating screens mounted therein, means for vibrating the same comprising a flat spring-bar bolted at one end to the said screens, a yoke secured at its other end, an eccentric engaging said yoke, the said yoke being provided with lateral projections, rods secured at one end to the said lateral projections upon the yoke and fastened at their other ends to the said flat spring-bar whereby the said bar is stiffened and strengthened at the end adjacent to the eccentric, the bar being sufficiently flexible to allow it to accommodate itself to the movements of the eccentric, substantially as described.

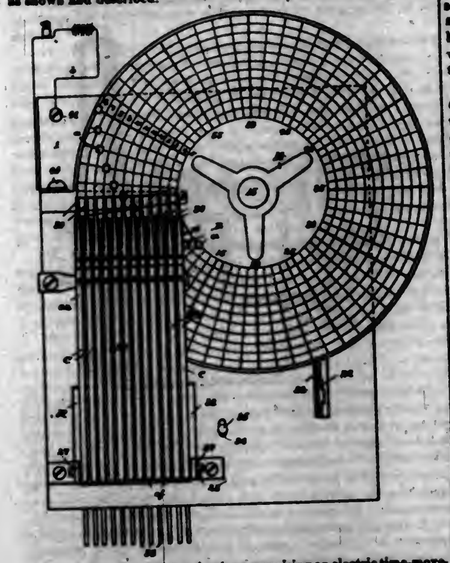
608,449. DISK HARROW. DAVID R. LIVINGSTON, Tacitus, Tex. Filed July 8, 1897. Serial No. 643,814. (No model.)

Claim.—1. The combination with the harrow-tongue and the doubletree pivotally secured thereto, of a caster-wheel secured to the tongue at a point in advance of the doubletree, said wheel having a bearing-face adapted to engage the front face of the doubletree, substantially as shown and described.

2. The combination with the tongue and the doubletree, of the caster-wheel and a supporting-bracket, said bracket having a shank provided with a series of apertures vertically adjustable in the tongue at the point in front of the doubletree, said bracket having inner faces held to bear against the front face of the doubletree, a retaining-pin 14, all being arranged substantially as shown and for the purposes described

---

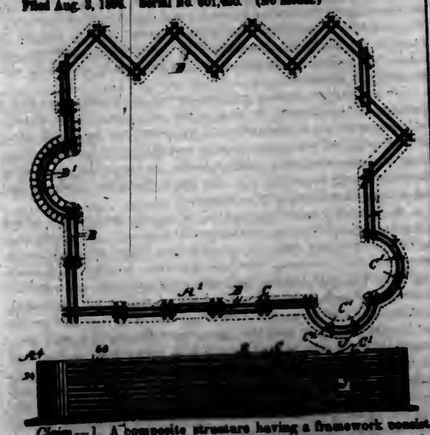
608,450. ELECTRIC PROGRAM-CLOCK. JAMES O. LYNAH, Waterbury, Conn. Filed Apr. 26, 1897. Serial No. 633,916. (No model.)



Claim.—1. In a program-clock of the class described, the combination with a rotatable perforated dial, of a contact-plate behind said dial, a series of fingers pivoted below said dial, and bearing weights 33 and arm 34, a series of cams to engage and operate said arms, means for intermittently rotating said cams in a manner to successively lower and raise the fingers.

2. In a program-clock of the class described, the combination with a rotatable perforated dial, of a contact-plate behind said dial, a series of fingers pivoted adjacent to said dial and having their free ends adapted to operate thereon, weights to normally hold said fingers in contact with the dial, arms attached to the fingers, a series of cams upon which the free ends of said arms ride, means for intermittently rotating said cams in a manner to operate the fingers.

3. In a program-clock of the class described the combination with a frame and a rotary perforated dial, of a contact-plate behind said dial, a series of fingers pivoted adjacent to said dial and having their free ends adapted to operate thereon, an arm secured to the frame and bearing guide-pins for the fingers aforesaid, weights for normally holding the fingers against the dial, a series of independent cams adapted to operate said fingers against the action of their weights, connections for intermittently rotating said cams in a manner to operate the fingers.



4. A program-clock mechanism comprising, a rotatable perforated dial, a series of fingers pivoted adjacent to said dial and bearing weights to hold them into engagement therewith a series of cams adjacent to said fingers and adapted to control the position of the latter, connections for operating said cams comprising a pawl and ratchet, a link connected therewith, lever 16 attached to said link, a cam 5 for operating said lever, and means for operating said cam.

5. A program-clock mechanism comprising, a rotatable perforated dial, a series of fingers pivoted adjacent to said dial and bearing weights to hold them into engagement therewith, a series of cams mounted upon a shaft adjacent to said fingers and adapted to control the position of the latter, a pawl and ratchet mounted on said shaft, an arm on said pawl to permit of the independent operation of said ratchet and cam-shaft, connections with said pawl and ratchet whereby the latter is operated by an electric time-movement substantially as shown and described.

6. A program-clock mechanism comprising an electric time-movement A, cam 5 upon the minute-shaft thereof, a lever 16 operated by said cam, connections with said lever for operating a cam-shaft, a series of cams upon said shaft, a series of fingers bearing arms to engage said cams and provided with weights to insure said engagement, a dial provided with suitable perforations and upon which the free ends of said fingers are designed to operate, a contact-plate behind said dial and in line with the free ends of the fingers aforesaid.

608,451. FORTIFICATION. JAMES A. MILLER, New Haven, Conn. Filed Aug. 3, 1896. Serial No. 601,455. (No model.)

Claim.—1. A composite structure having a framework consisting of several series of bars with overlapping and interlocking ends, and arranged with openings or spaces between the bars, and a body of cast metal, cast around such framework, so as to surround and penetrate between the bars, substantially as described.

2. A composite structure having a framework consisting of several series of wrought-iron bars, with the ends of one series overlapping and interlocking with the ends of an adjoining series, the bars of each series being arranged so as to have spaces or openings extending through between them and a body of cast-iron, cast so as to surround the bars and fill the spaces between them, substantially as described.

3. A composite structure having a framework consisting of a series of bars, another series of bars between the bars of the other series, and arranged transversely thereto, the bars of the different series being arranged as that there are spaces extending through between them and a body of cast material, cast around such framework, so as to surround the bars thereof and fill the spaces between them, substantially as described.

4. A composite structure having a framework consisting of several series of bars arranged with the ends of one series overlapping the ends of an adjoining series, bars transverse to and between the other bars, and a cast body, cast around such framework, so as to surround the bars thereof and fill the spaces between such bars, substantially as described.

5. A composite structure having a frame consisting of a series of bars, a series of bars at right angles to the other bars, and a body of cast metal surrounding the bars of the first series and portions of the bars of the other series, substantially as described.

6. A composite structure having a series of substantially horizontal bars and two series of upright bars, on the opposite sides of the horizontal bars, a body of cast metal surrounding the horizontal bars and a portion of each of the vertical bars, so as to tie such latter bars to the horizontal ones, substantially as described.

7. A composite structure having a framework consisting of a series of parallel bars, I-shaped in cross-section, and a body of cast metal covering such bars and filling the spaces between them and between their flanges, substantially as described.

8. A composite protective structure having a protective covering formed of a series of layers of parallel bars, in which the bars of one layer run transverse to those of an adjoining layer, bars extending between the bars of the several layers, in a direction at right angles to such layers, and a body of cast-iron cast upon and around the bars, substantially as described.

9. A composite protective structure having an opening surrounded by one or more channel-bars, bent to make the opening, and having their flanges on their outer sides and a body of cast material, cast around such bar or bars, so as to enter the space between the bar-flanges, substantially as described.

10. A composite protective structure having an opening with a frame encircling it made of one or more bars of wrought-iron bent to inclose the opening and having flanges on their outer sides, a body of cast-iron, cast around the opening-casing, composed of such bar or bars, so as to make the same project between the bar-flanges, substantially as described.

11. A composite structure having an opening surrounded by a frame made of one or more bars bent to inclose the opening, each having flanges in its outer side and openings in its web, and a body of cast metal, cast around such frame, so as to inclose it and enter between the flanges on the bar or bars, substantially as described.

12. A composite protective structure having a series of bars to form a framework, and an opening inclosed by one or more channel-bars, bent to inclose the opening, and having their flanges turned outward, and arranged so that the ends of the framework-bars project in between them, and a body of cast metal, cast upon and around the framework-bars, and into the spaces between the flanges on the bar or bars inclosing the opening in the structure, substantially as described.

13. A composite structure having an opening inclosed by one or more channel-bars bent to surround the opening and having their flanges turned outward, series of framework-bars having their ends projecting into the spaces between the flanges of the respective channel-bars, and a body of cast metal, cast upon and around the series of bars, and around the outside of the channel bar or bars, so as to surround the outer side of the opening-frame formed of the latter bar or bars and enter the spaces between the flanges thereof, substantially as described.

14. A composite protective structure having an opening with a frame inclosing it, made of one or more channel-bars with their flanges turned outward, series of bars having their ends projecting in between the flanges of the bar or bars, series of bars arranged between and at right angles to the bars of the other series and a body of cast metal, cast upon and around the two series of bars and around the frame of the opening so as to extend into the space between the flanges of each channel-bar forming such frame, substantially as described.

15. Composite armor for defensive structures consisting of a framework of longitudinal tiers or rails or beams of wrought metal arranged one above the other and resting upon and separated by transverse bars in the straight or non-angular portions of the wall,

and at the sides of the ports, having their ends intermeshing at the angles thereof, and vertical bars placed adjacent the port, in combination with a body of metal cast around and integrally inclosing the said framework substantially in the manner and for the purpose specified.

16. In a fort or turret the combination of a framework or interlacery of wrought-metal bars, beams or rails, a body of cast-iron or other suitable metal cast around and integrally inclosing the framework, and a surface plating of wrought-metal sheets or bars having engaging parts or projections inserted and embedded within the cast metal of the structure, substantially in the manner and for the purpose specified.

17. In a defensive structure of wrought-metal interlacery embedded in a cast-metal body, the combination therewith of the port, combining one or more frames of channel-iron bent to the form of the cross-section of the port, and having the cast metal cast around the frames and engaging the flanges thereof, substantially as and for the purpose specified.

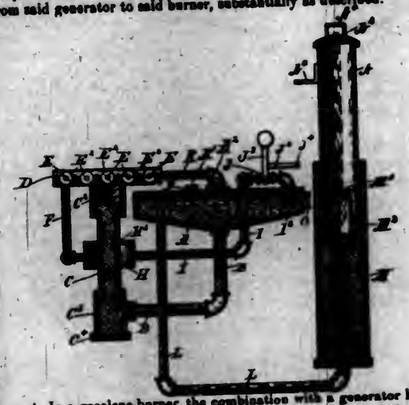
18. In a fortification or defensive structure of wrought-metal interlacery embedded in cast metal cast around and between the parts thereof, the construction of the embrasure, combining one or more frames of channel-iron bent to the form of the cross-section of the embrasure, and having the cast metal cast around the frames and engaging the flanges thereof, the horizontal rails of the wrought-metal interlacery projecting into the spaces between the flanges of the channel-iron frames, and being reinforced by auxiliary vertical rails adjacent the sides of the embrasure, substantially as and for the purpose specified.

19. In a defensive structure of wrought-metal interlacery or framework embedded in a cast-metal body, the construction of the embrasure consisting of the combination of the channel-iron frames lining the port, with flanges projecting outwardly, the horizontal rails having their ends terminating at or near the channel-iron frames, and a series of vertical beams or bars, arranged at the sides of the port and between the horizontal rails, the cast metal being cast around and between the wrought-metal parts, and interlocking therewith, substantially in the manner and for the purpose specified.

20. In fortifications or structures for military defense, the herein-described mechanism for closing the embrasures comprising in combination a shield or stopper supported on the ends of carrying braces or beams, a vertical composite post or pivotal structure mounted and journaled in the fortification and having the supporting-beams of the stopper secured thereto, the post being adapted to be turned by suitable mechanism to swing the stopper into position to open or close the embrasure, substantially in the manner and for the purpose specified.

21. In a protective structure having an embrasure in combination with a shield to cover the inside of the embrasure, an upright post pivoted in suitable bearings so as to be rotatable and having one or more arms attached to the embrasure-closing shield so as to support the same, substantially as described.

22. In a protective structure having an embrasure in combination with a shield for closing the embrasure, an upright rotatable post journaled in suitable bearings and a series of inclined arms carried by the post and supporting the shield, and means for rotating the post, substantially as described.



23. In fortifications the herein-described mechanism for closing the port comprising in combination a composite shield or stopper having supporting braces or beams embedded in it, a vertical composite post or pivotal structure of wrought and cast metal mounted and journaled in the fortification and having the supporting-beams of the stopper embedded in it, the post being adapted to turn by suitable mechanism to swing the stopper into position to open or close the port, substantially in the manner and for the purpose specified.

608,452. GASOLENE-STOVE. Gamaliel B. Mussell, Newport, Ky. Filed Aug. 10, 1896. Serial No. 602,344. (No model.)

Claim.—1. In a gasolene-burner, the combination of a tank and generator, connections between the tank and the generator adapted to convey gasolene from the tank to the generator, said tank and generator being so arranged relatively to each other that the gasolene stands at the same level in both, connections from the upper part of the generator to the upper part of the tank, and means for heating said generator, substantially as described.

2. In a gasolene-burner, the combination with a gasolene-tank, of a generator, a duct adapted to convey gasolene from said tank to said generator, the said generator being so situated relative to said tank that the gasolene maintains the same level in both, vapor-outlets mounted on said generator and communicating with the interior thereof, a duct leading from the upper portion of said tank to the upper portion of said generator and a burner adapted to heat said generator, with means for supplying vapor from said generator thereto, substantially as described.

3. In a gasolene-burner, the combination with a gasolene-tank, of a generator situated on a level with said tank, a duct leading from the lower portion of said tank to the lower portion of said generator and adapted to convey liquid gasolene from said tank to said generator, a duct leading from the space above the liquid in the tank to the space above the liquid in the generator, vapor-outlets carried by said generator and adapted to receive vapor therefrom, a burner adapted to heat the said generator and means for conveying vapor from said generator to said burner, substantially as described.

4. In a gasolene-burner, the combination with a generator having vapor-outlets, a gasolene-tank located on the same level with said generator, a duct adapted to conduct the liquid gasolene from said tank to said generator, a duct leading from the space above the gasolene in said tank to the space above the gasolene in said generator, a burner adapted to heat the said generator, means for conveying vapor from said generator to said burner and means for producing pressure upon the gasolene in said tank, substantially as described.

5. In a self generating gasolene-burner, the combination with a generator, of a chamber communicating therewith, valves communicating with said chamber, commingling-tubes for said valves, a subburner for heating said generator, one of the said commingling-tubes supplying the said subburner with fuel from the generator, a gasolene-tank located on a level with said generator and duct connecting the top and bottom of said tank respectively with the said chamber and generator, substantially as described.

6. In a self-generating gasolene-burner, the combination with a generator of a chamber mounted thereon and communicating therewith, needle-valves carried by said chamber, commingling-tubes for said valves, a subburner for heating said generator, one of the aforesaid commingling-tubes supplying said subburner with fuel from said generator, a gasolene-tank located on a level with said generator, the space above the liquid gasolene in said tank communicating with the space above the gasolene in said generator, a duct adapted to conduct the liquid gasolene from said tank to said generator and means for producing air-pressure on the gasolene in said tank, substantially as described.

7. In a self-generating gasolene-burner, the combination with a generator, of a subburner for heating the said generator, an oil-tank and carbureter connected with said generator, the said tank being located on a level with said generator and having the top and bottom thereof connected to the said generator, an aerometer, and a duct connecting said aerometer with the space above the liquid in said gasolene-tank, substantially as described.

8. In a self-generating gasolene-burner, the combination with a generator, of a subburner for heating said generator, a gasolene-tank and carbureter, said tank being located on a level with said generator, said tank connected with said generator so that the gasolene maintains the same level in both generator and tank, an aerometer consisting of a chamber adapted to slide vertically in a water-tank, a valve in the upper part of said chamber, a duct leading from the air in said aerometer with the space above the liquid in said gasolene-tank, and a valve carried by said duct, substantially as described.

9. In a self-generating gasolene-burner, the combination with a generator, of a subburner for heating the same, a gasolene-tank and carbureter, said tank being located on a level with said generator and having the top and bottom thereof communicating with the said generator, an aerometer, a water-tank in which said aerometer is adapted to slide vertically, a valve in the upper part of said aerometer, a duct leading from the air in said aerometer to the space above the gasolene in the gasolene-tank, a valve carried by said duct, and means whereby the said aerometer stops the operation of said carbureter, substantially as described.

10. In a self-generating gasolene-burner, the combination with a generator, having a subburner for heating the same, and a gasolene-tank having a carbureter connected with said subburner, ducts connecting the top and bottom of said tank with said generator, a valve carried by said carbureter, of an aerometer, a water-tank in which the said aerometer is adapted to slide vertically, a valve in the upper part of said aerometer, a pipe leading from the air in said aerometer to the space above the liquid in said gasolene-tank, a valve carried by said pipe within said aerometer, the said aerometer adapted to engage and close the valve of the carbureter, substantially as described.

11. In a self-generating gasolene-burner, the combination with a generator and a subburner for heating the same, a gasolene tank located substantially on the same level and communicating with the said generator, a pipe connecting the space above the liquid in said gasolene-tank with said burner and provided with wicking over it mouth within said gasolene-tank, a valve carried by said pipe, an aerometer, a water-tank in which said aerometer is adapted to slide vertically, a valve in the upper part of said aerometer, a pipe connecting the air-space in said aerometer with the space above the liquid in said gasolene-tank, a valve carried by said pipe within said aerometer, the said aerometer being adapted to engage and close the valve of the carbureter, substantially as described.

12. In combination with gasolene-generator the tank A, generator-pipe C, needle-valve openings at a higher level than gasolene in tank A, subburner H adapted to heat generator from the level of the bottom of the tank to the top of generator, pipe K, pipe B, pipe L, air-pressure device M, substantially as and for the purpose specified.

13. The combination of needle-valves, and commingling-tubes, a generator for supplying the needle-valves with vapor, a subflame-burner contiguous to the generator, a commingling-tube from one of said valves to the burner, a gasolene-tank for supplying gasolene to the generator, a pipe I from the subflame-burner to the upper portion of said gasolene-tank and there provided with wicking over its mouth absorbing gasolene from the tank, and an aerometer sliding vertically in a water-tank, and having a valve in its upper part, and a pipe in the tank connecting the air in the aerometer with the space above the liquid in the gasolene-tank, and having a valve at its end in the aerometer, a valve J provided with an arm located in the pipe I, and a projection of the aerometer for enabling the descent of the latter to trip the valve and close the passage through pipe I, substantially as and for the purposes specified.

14. The combination of needle-valves, and commingling-tubes, a generator for supplying the needle-valves with vapor, a subflame-burner adapted to heat the generator, a commingling-tube from one of said valves to the burner a gasolene-tank for supplying gasolene to the generator, a pipe I from the subflame-burner to the upper portion of said gasolene-tank and there provided with wicking over its mouth absorbing gasolene from the tank, and an aerometer sliding vertically in a water-tank, and having a valve in its upper part, and a pipe in the tank connecting the air in the aerometer with the space above the liquid in the gasolene-tank, and having a valve at its end in the aerometer, a valve J located in the pipe I and provided with the arm J^3, and pin J^4, and weighted arm J^5, substantially upright when the valve is open, and a projection N^2 on the aerometer, for depressing the arm J^3 and closing the valve as the aerometer descends, substantially as and for the purpose specified.

15. The combination of needle-valves, and commingling-tubes, a generator for supplying the needle-valves with vapor, a subflame-burner adapted to heat the generator, a commingling-tube from one of said valves to the burner, a gasolene-tank for supplying gasolene to the generator, a pipe I from the subflame-burner to the upper portion of said gasolene-tank and there provided with wicking over its mouth absorbing gasolene from the tank, and an aerometer sliding vertically in a water-tank, and having a valve in its upper part, and a pipe in the tank connecting the air in the aerometer with the space above the liquid in the gasolene-tank, and having a valve at its end in the aerometer, a valve J located in the pipe I, and means for enabling the aerometer to close the valve, substantially as and for the purpose specified.

16. The combination of needle-valves, commingling-tubes, generator-pipe, subflame-burner adapted to heat the generator from bottom of tank to the top of generator, a commingling-tube from one of the needle-valves to the subflame-burner, a gasolene-tank, the gasolene in same being at a lower level than the needle-valves, a gasolene-pipe B from the tank to the generator, a conduit from the space above the gasolene in tank to the space above the gasolene in the generator, a pipe I leading from space above the gasolene in tank A to a subflame-burner and adapted for primary heating of generator, a valve in pipe I, a pipe L for supplying air to the space above the liquid in said tank, and a device for supplying air under pressure to pipe L, and means for closing the valve of pipe I by the movement of the air-pressure device, substantially as and for the purpose specified.

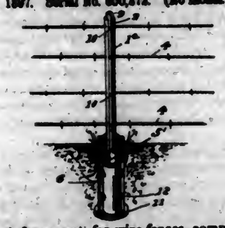
17. The combination of the needle-valves, commingling-tubes, generator-pipe, subflame-burner contiguous to generator-pipe, a gasolene-tank on a level with the generator, a gasolene-pipe B from the tank to the generator, a pipe I to the subflame-burner chamber from the space above the liquid in the tank and having a wicking at its mouth adapted to absorb gasolene from the tank, a valve in said pipe, a pipe L for supplying air to the said space above the liquid in the tank, and a device for supplying air under pressure to the pipe L, and a pipe K, connected to the said space in the tank A, and the pipe D connecting the upper end of the generator to the pipe K, substantially as and for the purposes specified.

18. The combination of needle-valves, commingling-tubes, generator-pipe, a subflame-burner adapted to heat the generator, a gasolene-tank on a level with the generator, a gasolene-pipe B from the tank to the generator, a pipe I to the subflame-burner chamber from the space above the liquid in the tank and having a wicking at its mouth adapted to absorb gasolene from the tank, a valve in said pipe, a pipe L for supplying air to the space above the liquid in the tank, and a device for supplying air under pressure to the pipe L, and a pipe K, connected to the said space in the tank A, and the pipe D connecting the upper end of the generator to the pipe K, and means for closing the valve of pipe I, substantially as and for the purpose specified.

19. The combination of the needle-valves, and their commingling-tubes, and a generator, a subflame-burner adapted to heat the generator, a gasolene-tank substantially on a level with the generator, a pipe therefrom to the generator to supply the latter with gasolene, a pipe having wicking at its mouth, adapted to absorb gasolene from the tank, at the upper part of the gasolene-tank, and connected to the subflame-burner, a pipe for supplying air under pressure to the gasolene-tank, and means substantially as described for preventing the gasolene in the generator from rising to a higher level than that in the tank, substantially as and for the purposes specified.

20. The combination of the needle-valves, and their commingling-tubes, and a generator, a subflame-burner adapted to heat the generator, a gasolene-tank on a level with the generator, a pipe therefrom to the generator to supply the latter with gasolene, a pipe having wicking at its mouth adapted to absorb gasolene at the upper part of the gasolene tank, and connected to the subflame-burner, a pipe for supplying air under pressure to the gasolene-tank, and a pipe arranged to communicate with the upper part of the generator and the space above the liquid in the tank, for keeping the gasolene in the tank and generator at a common level, substantially as and for the purposes specified.

21. The combination of needle-valves, and commingling-tubes, a generator for supplying the needle-valves with vapor, a subflame-burner contiguous to the generator, a commingling-tube from one of said valves to the burner, a gasolene-tank for supplying gasolene to the generator, a pipe I from the subflame-burner to the upper portion of said gasolene-tank and there provided with wicking over its mouth absorbing gasolene from the tank, and an aerometer sliding vertically in a water-tank, and having a valve in its upper part; and a pipe in the tank connecting the air in the aerometer with the space above the liquid in the gasolene-tank, and having a valve at its end in the aerometer, a valve J located in the pipe I, and an arm of the valve, and a projection of the aerometer for enabling the descent of the latter to trip the valve and close the passage through pipe I, and the pipe K, establishing connection between the spaces above the liquid in the generator and the gasolene-tank, substantially as and for the purposes specified.

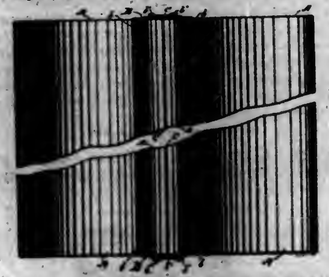


608,453. DRAFT-SUPPLY APPARATUS. William H. Page, Santa Cruz, Va. Filed May 17, 1897. Serial No. 636,918. (No model.)

Claim.—1. The combination with a stove, of a horizontally-disposed tube projecting therefrom, a swinging draft-supply member carried upon the tube and adapted to be swung vertically thereon, and an aperture near the extremity of the draft-supply member opposite the tube, substantially as set forth.

2. The combination with a stove, of a horizontally-disposed tube projecting therefrom, a swinging draft-supply member carried upon the tube and adapted to be swung vertically thereon, a fender located within the tube adapted to prevent access of ashes from the stove to the draft-supply member, and an aperture near the extremity of the draft-supply member opposite the tube, substantially as set forth.

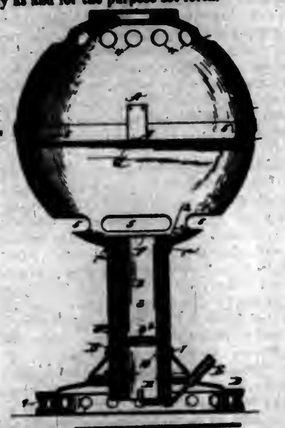
603,454. FENCE-POST. JAMES H. PIERSON, Worthington, Ind. Filed Sept. 7, 1897. Serial No. 650,572. (No model.)



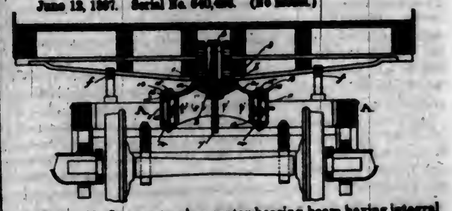
Claim.—1. A fence-post for wire fences, comprising a metallic post proper having a continuous longitudinal bore, a continuous longitudinal slot through its wall communicating with said bore, and guides for the wires, and a subpost provided with a continuous drain and post-receiving bore merging into a flaring annular face at the top thereof adapted to gradually contract the lower end of the said post proper when it is inserted into said subpost-bore, substantially as described.

2. A fence-post for wire fences, having a longitudinal bore, a continuous slot through its wall communicating with said bore, a series of alined orifices for passage of the fence-wires, and a wedge inserted into the bore of the post adapted to clamp the wires, and a subpost having a continuous longitudinal bore, longitudinal flanges with segmental lugs on either side thereof and an annular flange at the base of said subpost, substantially as described.

3. A fence-post, comprising a post proper, and a subpost or socket member having a bore adapted to receive said post proper and to serve as a drain-inlet, said subpost provided with longitudinal flanges 6, an annular flange 11 on the base of said subpost, segmental lugs 12 on each side of the flanges 6 and integral therewith and with the body of said subpost, as and for the purpose set forth.



603,455. PIPE-BINDER. CHARLES L. PIERSY, Los Angeles, Cal. Filed May 26, 1897. Serial No. 638,305. (No model.)



Claim.—A fastening device, for the purpose of holding pipes in bundles, consisting of the plates B with peripheral lugs *b* and tongues *b'*, and the central wires C adapted to be secured about said tongues as shown and described.

603,456. GAS-STOVE. ALBERT L. PITNEY, Washington, D. C., assignor to the Calvert Heating Company. Filed July 14, 1896. Serial No. 599,113. (No model.)

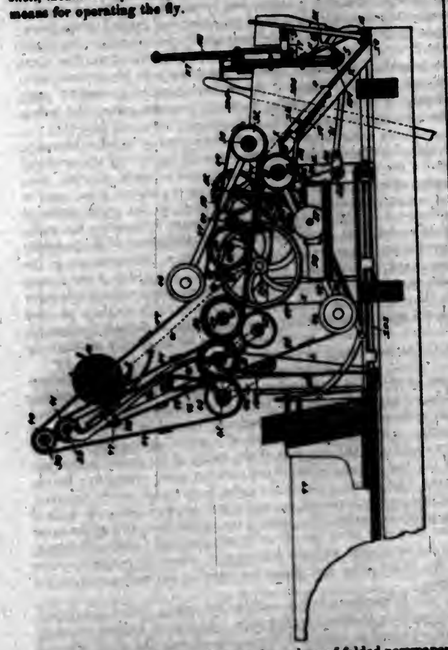
Claim.—In a gas-stove, the combination of a perforated base or support, a chamber of smaller diameter than the base, a perforated wall in said chamber dividing the same into a mixing and a mixing and heating chamber, a gas-supply opening into the mixing-chamber, a burner located at the upper end of the mixing and heating chamber, a heating or radiating chamber surrounding the burner, and a spreader-plate located in the radiating-chamber above the burner, substantially as and for the purpose set forth.

603,457. CAR-TRUCK. MORRIS R. SCHAFFER, St. Louis, Mo. Filed June 12, 1897. Serial No. 640,498. (No model.)

Claim.—1. In a car-truck, a center-bearing beam having integral therewith the center plate and at the ends the columnar enlargements 10 formed with bearings 11 and 12.

2. In a car-truck a transverse center-bearing beam having integral therewith the center plate and at the ends the columnar enlargements 10 formed with bearings 11 and 12, combined with the longitudinal arch-bars and the adjusting-plates in said bearings.

3. In a six-wheel passenger-car truck, the combination with the spring-beam having the side bearings secured thereto, of a center-bearing beam having its center plate integral therewith, and having integral therewith at its ends columnar enlargements formed with bearings, and the center bearing arch-bars engaging said bearings and connected with the spring-beams.



603,458. MACHINE FOR SEALING NEWSPAPERS. HERMAN T. SUNDERMAN, Galveston, Tex. Filed June 10, 1897. Serial No. 640,130. (No model.)

Claim.—1. For sealing the free edges of folded newspapers the combination, of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, an advancing device for receiving the papers, means for operating said device for delivering the papers to the belts, and a fly and means for operating it to deliver the papers to the advancing device.

2. For sealing the free edges of folded newspapers, the combination, of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, an advancing device for receiving the papers, and means for operating the device for delivering the papers to the belts.

3. In a machine for sealing the free edges of folded newspapers, the combination, of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a slide device for advancing the paper to the belts, means for operating said device, and a shelf or ledge for receiving the paper, and means for operating the shelf for transferring the paper therefrom to the said slide.

4. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering sealed paper, with a system of endless traveling belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a slide device for advancing the paper to the belts, a shelf or ledge pivotally mounted for receiving the paper and transferring it to said slide, a fly arranged to push the paper from said shelf, means for operating the shelf by connections with the fly, and means for operating the fly.

5. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a slide device for advancing the paper to the belts, a shelf or ledge for receiving the paper and transferring it to said slide, a fly arranged to push the paper from said shelf, means for operating the shelf by connections with the fly, a packer for the sealed papers at the rear of the belts and means connecting the slide, the fly, the packer and the power-driven shaft for simultaneous operation in the way described.

6. In a machine for sealing the free edges of folded newspapers, the combination, of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a device having detents for advancing the paper to the belts, a packer for the sealed papers at the rear of the belts and means for connecting the slide, the packer, the driven belt-pulley shafts and the driven power-shaft, whereby the several devices are actuated in unison in carrying the papers through the machine.

7. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed papers, with a system of endless traveling belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a device having detents for advancing the paper to the belts, a pivotally-mounted shelf or ledge for receiving the paper and transferring it to said slide, a fly arranged to push the paper from said shelf, the said shelf having an arm, and the said fly having a stud for engaging said arm, a spring connecting said shelf and a stop for controlling the normal position of said shelf, whereby the movement of the fly automatically operates the shelf.

8. In a machine for sealing the free edges of folded newspapers the combination of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts, arranged in upper and lower sets, whereby the paper is seized and between which it is carried and supported in the operation of pasting, sealing and delivering it, a slide for advancing the paper to the belts, a device for depositing paste upon the paper, consisting of a pair of spring-sustained pasters adapted to rotate in the direction of the travel of the paper and to seize and impress paste upon its opposite sides, means for supplying paste to the pasters and means for effecting the movements of the slide and the pasters whereby the paper will be advanced so that its free edges will arrive at the point where they will be embraced and compressed between the surfaces of the pasters.

9. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a device having detents for advancing the paper to the belts, a pivotally-mounted shelf having the arms 11 and 16, a guard-rail 17, a stop-arm 14, and a spring 8, whereby the shelf is caused to be tilted forward with the laying movement of the fly and returned to its normal position to receive and support a paper, and means connecting the power-driven shaft for actuating said fly.

10. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed paper, with a system of endless traveling belts arranged in upper and lower sets, whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a slide device for advancing the paper to the belts, a pivotally-mounted shelf, and a fly connecting and operating said shelf, a packer at the rear of the machine, and connections for conjointly operating the slide, the shelf, the fly and the packer, consisting of the cranks 29 and 23 and the rods 28, 21 and 102, and the crank 36, on the power-driven shaft, the rod 25 and the crank 24 on the rock-rod 23, the said cranks being arranged to operate the said devices in the order and relation stated.

11. For sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed paper, with devices for advancing the papers, of a system of endless traveling belts arranged in upper and lower sets upon driving and loose pulleys whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, the receiving ends of the upper belts extending in front of and overhanging the lower belts, whereby the paper is caused to enter the belts free from pressure by the overhanging pulleys, and devices for pasting and sealing the papers as they are carried by and between said belts.

12. In a machine for sealing the free edges of folded newspapers, the combination of mechanism for pasting, sealing and delivering the sealed paper, with devices for advancing the papers, a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, the receiving and the terminal ends of the upper belts being mounted upon loose pulleys and driven by an intermediate pulley, and the receiving ends of the lower belts mounted upon loose pulleys and the terminal ends of said belts mounted upon driven pulleys arranged between the driving and the loose pulleys of the upper belts for operation in the way described.

13. For sealing the free edges of folded newspapers, the combination, with devices for advancing a folded newspaper, devices for pasting its free edges, devices for feeding a sealing-ribbon, devices for severing a sealing-strip from the ribbon, of a system of endless traveling belts whereby the paper is seized from the advancing devices, supported and carried between the belts to and between a pair of pasters, to devices which present to the paper a severed ribbon strip, and is reversed in the direction of its travel and delivered from between the belts.

14. For sealing the free edges of folded newspapers a carrying device for the papers consisting of a system of endless belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, the combination therewith of a device for reversing the direction of the travel of the paper located and arranged above the driving-pulleys of the lower sets of belts and between the oppositely-moving sides of the upper sets of belts and mechanism for pasting, sealing and delivering the sealed paper.

15. For sealing the free edges of folded newspapers an advancing and carrying device for the paper consisting of two or more sets of endless belts arranged as an upper set and a lower set, the upper belts mounted upon loose initial and terminal pulleys and intermediate driving-pulleys, the lower belts mounted upon initial loose and fixed driving terminal pulleys, the upper and the lower belts moving in contact from the loose initial pulleys to and up between the driving-pulleys, the upper belts extended upward over the fixed terminal driving-pulleys of the lower belts terminating upon the loose pulleys in com-

bination with mechanism for pasting, sealing and delivering the sealed paper, at the rear of the terminal driving-pulleys, whereby without leaving the belts, the paper is seized, and in its travel is supported and has its free edges pasted and sealed in that part of its travel between the initial and the driving pulleys and is delivered from the machine.

16. An advancing, carrying and controlling device in a machine for sealing the free edges of folded newspapers, consisting of a system of endless traveling belts arranged in an upper and lower set by which the paper is sealed, and between which it is supported and carried in the operation of pasting, sealing and delivering it, the combination therewith of mechanism for pasting, sealing and delivering the sealed paper, a device for reversing the direction of the travel of the paper, located and arranged, above the driving-pulleys of the lower belts, and between the oppositely-moving sides of the upper belts, the said reversing device consisting of fixed fingers standing back of the delivering-passage of the terminal pulleys of the belts, and a pivoted spring-controlled arm normally standing in front of the said delivering-passage for coöperating with the belts in the way described.

17. For sealing the free edges of folded newspapers an advancing and carrying device for the papers consisting of a system of endless belts arranged in upper and lower sets, by which the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, the combination therewith, of mechanism for pasting, sealing and delivering the sealed paper, a device for reversing the direction of the travel of the paper located and arranged above the driving-pulleys of the lower belts and between the oppositely-moving sides of the upper sets of belts, and weights for the upper and lower sets of belts, whereby the system of belts is maintained under proper tension for operation in the way described.

18. The combination, with devices for advancing a folded paper, devices for pasting its free edges, devices for feeding a sealing-ribbon, devices for severing a sealing-strip from the ribbon, of a system of endless traveling belts arranged upon loose and driving pulleys in upper and lower sets, the upper sets extending above and returning downward over and in rear of the terminal driving-pulleys of the lower sets, and means located and arranged between the oppositely-moving sides of the upper belts, whereby the paper having emerged from between the belts is caused to be again seized by them for delivery.

19. An advancing, carrying and controlling device, in a machine for sealing newspapers, consisting of upper and lower sets of endless traveling belts, the upper sets of belts mounted upon the loose pulleys 32, 40, 41 and 43, and the driving-pulleys 36, the lower sets of belts mounted upon the loose pulleys 33, and the fixed pulleys 37, the weighted roll 46 for each belt, the driving-pulleys of the lower belts being between the driving and loose pulleys 36 and 43 of the upper belts, in combination with the fixed and spring-controlled fingers 48 and 95 arranged between the oppositely-moving sides of the upper belts and coöperating with the upper and the lower belts for operation in the way described.

20. For sealing the free edges of folded newspapers the combination with devices for advancing the papers, of a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, means whereby the belts are maintained under yielding tension in advancing the paper between them, and devices for pasting and sealing the papers as they are carried by and between said belts.

21. For sealing the free edges of folded newspapers, the combination with devices for advancing the papers, of a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, means whereby the belts are maintained under yielding tension in advancing the paper between them and a pair of pasters adapted to meet in their rotation and transfer under pressure paste on both sides of the paper as it is carried between and with the rotation of the pasters, and mechanism for sealing and delivering the sealed paper.

22. For sealing the free edges of folded newspapers, the combination with devices for advancing the papers, of a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported, and carried in the operation of pasting, sealing and delivering it, devices for pasting and for sealing the papers as they are carried by and between said belts, means for rendering certain the transfer of the paper over the driver pulleys 37 and between the belts at their terminal meeting between the pulleys 37 43, consisting of the fixed fingers 48 and the pivoted spring-sustained finger 45 and the spring-sustained catches of the said driven pulleys, arranged for coöperation with the upper and the lower sets of belts as set forth.

23. In a machine for sealing the free edges of folded newspapers, the combination with endless traveling belts arranged in upper and lower sets, of means for advancing the paper to and between the belts, pasters arranged to rotate whereby one receives paste and transfers it to the other and both to the opposite sides of the paper, means for applying an unpasted sealing-strip to the pasted sides of the paper, means for applying pressure to the sealing-strip and means whereby the belts are extended upward and returned downward whereby to reverse the direction of the travel of the paper in the way and for the purpose stated.

24. In a machine for pasting folded newspapers and applying thereto a sealing-strip, the combination, with a system of endless traveling belts, arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, of a pair of pasters rotating in the direction of the travel of the paper in the path of the free edges to be sealed and timed to meet under pressure on the opposite sides of and at the free edges of the advancing paper, to impress paste thereon, means for supplying paste to the under paster, and means for applying the sealing-strip to the paper in the way described.

25. In a machine for sealing the free edges of folded newspapers, a pair of spring-sustained pasters, mounted upon shafts arranged one above the other, whereby the pasters will in their rotation, meet under pressure, means for causing the lower paster to take paste in its revolution, and transfer therefrom, paste to the upper paster as they meet in contact with each other, means for causing the paper to be sealed to be carried between the meeting faces of the pasters to receive paste therefrom on its opposite sides, the movement of the paper and the rotation of the pasters being so timed that the pasters will meet in contact with each other whereby one will transfer paste to the other and make a second revolution to cause them to meet on the opposite sides of the advancing paper to deposit the paste at the open edges to be sealed, and means for applying a sealing-strip to the pasted sides of the paper.

26. In a machine for pasting newspapers and applying a sealing-strip thereto, the combination, with a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing, and delivering it, of a pair of spring-sustained pasters rotating in the direction of the travel of the paper, in the path of the free edges to be sealed and meeting under pressure on the opposite sides of the paper at the point to be sealed, shafts for carrying said pasters arranged one above and the other below the path of the paper and gearing for rotating the pasters consisting of the equal gear 50, a gear 49 on the power-driven shaft and a pinion 60 engaging the equal gear with the driving-gear, means for supplying paste to the under paster and means for applying the sealing-strip to the paper.

27. In combination in a machine for pasting folded newspapers and applying thereto a sealing-strip, a system of endless traveling belts arranged in upper and lower sets whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, the pasters 50 rotating in the direction of the travel of the paper and adapted to meet and deposit paste on the opposite sides thereof under pressure, a sealing device consisting of plates 77 forming a passage between them, means for feeding a ribbon through said passage, a transverse slot 78 in one of said plates, a rest 90 below said slot for supporting a sealing-strip freely in the path of the paper, a clamp and a knife above said slot and a pair of spring-fingers extending back from the edges of said slot, for operation in the way described.

28. In a machine for sealing the free edges of folded newspapers, a pair of rotating arms, each having socketed or connected therewith a spring-sustained grooved or channeled surface, adjusted so that in rotating the said channeled surfaces will meet under pressure, in combination with means for advancing a newspaper between said pasters, means for supplying one or both of said pasters with paste, and means whereby the paper and the pasters are caused to meet to transfer paste from the pasters to the opposite sides of the paper, and means for applying to the latter a sealing-strip.

29. In a machine for sealing the free edges of newspapers, the combination, with mechanism for carrying a newspaper through the machine, of a pair of rotating pasters adapted to meet under pressure in their rotation in the path of the paper, a pasting device whereby paste is transferred to one of the pasters, which transfers paste to the other when meeting, the movement of the carrying mechanism being timed to cause the pasters to meet under pressure with each other whereby paste is transferred from one to the other in advance of the paper and to meet in their succeeding revolution on the opposite sides of the advancing paper to transfer the paste thereto at the edges to be sealed, mechanism for presenting a sealing-strip across the path of the pasted paper, and mechanism for applying said sealing-strip to the free edges of the paper to be sealed.

30. For sealing the free edges of folded newspapers, the combination with a suitable device for feeding a sealing-ribbon, a clamp and a knife operating to hold the ribbon and to sever a strip therefrom, and a rest on which the strip is freely supported at its lower end, means for feeding a newspaper to receive said strip, means for applying paste to the opposite sides of the paper, and means for applying and sealing the strip to the pasted paper.

31. For sealing the free edges of folded newspapers, the combination with a suitable device for feeding a sealing-ribbon, a clamp and a knife operating to hold the ribbon and sever a strip therefrom, a rest on which the strip is freely supported at its lower end, means for feeding a newspaper to receive said strip, means for applying paste to the opposite sides of the paper and means for applying and sealing the strip to the pasted paper consisting of the spring-fingers 79 79 and the pulleys 91, 92, between which the paper with the adhering strip passes, whereby the strip is folded and laid and then subjected to pressure between rolling surfaces.

32. For sealing the free edges of folded newspapers, the combination with suitable means for feeding a sealing-ribbon, means for severing a strip therefrom, means for feeding a newspaper to receive said strip, and means for applying paste to the opposite sides of the paper, of means for applying and sealing the strip, consisting of spring-fingers, and a pair of pulleys one of which is driven and the other is loose and sustained under pressure upon the sealing-strip.

33. For sealing the free edges of a folded newspaper, having its opposite sides provided with paste, a feed device for the ribbon consisting of the positively-geared rolls 63 64, a passage vertically in alinement with the meeting surfaces of said rolls, formed by plates 77, one of which has a slot 78 and below it a hook or rest 90 crossing the line of the passage and freely supporting the strip at its lower end, a clamp for holding the ribbon while being severed, a knife for severing the ribbon at the clamp, and means for intermittently actuating the geared feed-rolls, and for pasting the opposite sides of the paper.

34. For sealing the free edges of a folded newspaper having its opposite sides provided with paste, a feed device for the ribbon consisting of the roll 63 having the circumferential groove 67, the roll 64 engaging said groove, said rolls having engaging gear whereby they are positively rotated, and the roll 60, the said rolls 64 and 60 being on opposite sides of the roll 63 and maintained in contact therewith under a yielding pressure, a way or passage for the ribbon descending in alinement with the meeting surfaces of said geared rolls, a clamp and a knife for holding and severing a strip from the ribbon, a hook or rest for supporting the severed strip, the spring-fingers 79 79 for folding and applying the sealing-strip, and means for intermittently rotating said geared rolls.

35. For sealing the free edges of a folded newspaper, the combination, with the geared rolls 63 and 64 for feeding a sealing-ribbon, a severing, holding and folding device for a sealing-strip, consisting of a bracket or plate having a slot 78 transverse to the feed of the ribbon, spring-fingers extending horizontally back from the edges of said slot, a passage or way in alinement with the meeting surfaces of said rolls, a clamp and a knife crossing said passage between the rolls and the said slot, and a rest for the severed sealing-strip below said slot and means for pasting the free edges of the paper as it is advanced against the sealing-strip.

36. In a machine for sealing the free edges of folded newspapers, a feeding device for a sealing ribbon or strip, consisting of a roll having a circumferential guide groove or recess 67 for the ribbon, a roll 64 engaging the ribbon in said recess, both said rolls being geared together, and a roll 60, the pivoted spring-connected arms carrying said rolls and means for intermittently rotating said geared rolls.

37. In a machine for sealing the free edges of folded newspapers, the combination of the geared rolls one driving the other for feeding a sealing-ribbon, means for intermittently actuating said rolls consisting of a ratchet-wheel 73 on the driving-roll shaft, a knife for severing a strip from the ribbon, and a clamp for said ribbon, with means for actuating these parts, consisting of an eccentric 82 on the power-driven shaft, an arm and a pawl 74 connecting the strap and the ratchet-wheel, a spring 84 for withdrawing the knife, a spring 89 for forcing the clamp upon the ribbon and a spring 98 for retaining said clamp.

38. In a machine for sealing the free edges of folded newspapers and in combination with endless traveling belts arranged in upper and lower sets, whereby the paper is seized and between which it is supported and carried in the operation of pasting, sealing and delivering it, a device for advancing the paper to the belts, a fly device for laying the paper upon the slide, a pair of rotating pasters between the meeting surfaces of which the paper is caused to travel and is pasted, mechanism for feeding and severing a strip from a ribbon and a device for freely supporting the severed strip across the path of the paper, and having spring-fingers through which the paper and the strip are carried for folding the strip upon the pasted paper, pressure-pulleys between which the sealing-strip is carried to reinforce the sealing, and mechanism whereby the operation of these several devices is conjointly effected.

39. The combination with a holder and feeding mechanism for advancing on edge the front paper from a standing pile, and means for supporting the paper singly while being fed, of a shelf or ledge for receiving and holding the paper on its edge, means for tilting the shelf to deliver the paper, and means for carrying, pasting and sealing the edges of the papers.

40. The combination with a holder and feeding mechanism for advancing on its edge the front paper from a pile standing on edge, of a raceway formed by vertical walls between and by which the paper is supported on edge, and a shelf or ledge at the end of and in alinement with said raceway for receiving and holding the paper, means for tilting said shelf to deliver the paper, and means for carrying, pasting and sealing the edges of the papers.

41. In a machine for sealing the free edges of folded newspapers, the combination with mechanism for carrying the paper, means for feeding a sealing-strip, and applying the same, a device for advancing the paper to the carrying mechanism, and a device for receiving the paper, edgewise in vertical position, and delivering it upon said advancing device, of mechanism for feeding the papers vertically on their folded edges from a pile and transferring them in succession upon said receiving device in standing position, and means for conjointly connecting the several parts to effect the operations described.

42. The combination in a machine for sealing the free edges of paper, of mechanism for carrying, pasting, sealing and delivering the sealed paper, with a holder adapted to receive a pile of papers standing on edge, devices for feeding a sealing-strip, devices for feeding the papers vertically edgewise and at right angles to the line of travel of the carrying mechanism, and means for connecting the said feeding devices with the said carrying and strip-feeding mechanism, timed to feed the papers in unison with the travel of the carrying mechanism, and mechanism for applying the sealing-strip.

43. In a machine for sealing the free edges of folded newspapers, the combination with mechanism for carrying the paper, means for feeding, and for applying the sealing-strip, a slide for advancing the paper to the carrying mechanism, a pivotally-mounted shelf for receiving the paper edgewise in vertical position, and means for tilting said shelf to transfer said paper to the advancing slide, of a holder for holding the papers in pile standing edgewise, mechanism for feeding the papers vertically on their folded edges from the pile and transferring them in succession upon said receiving-shelf, and means for actuating said feeding mechanism in unison with the movements of the shelf, and with the carrying, pasting and sealing mechanism.

44. The combination with a holder adapted to receive a pile of papers standing on their edges, and a feeder or guard at the feed end of said pile whereby the papers are supported in vertical position, of a slide having catches 112 movable in the same plane and arranged to engage and move the paper by successive steps from and free of the pile, a raceway formed by parallel inclosing walls adapted to receive and support the paper as it is moved by the said catches, a separate and independent movable catch adapted to engage the paper at the point where it was left by the intermediate catch, a shelf device arranged to receive the paper from the last catch in position for delivery, the pivoted connections 118, 120 whereby the said several catches are connected and means for operating said catches independently of each other.

45. In a device for feeding papers from a pile, a vertical raceway having walls adapted to hold two papers on edge side by side, the combination with said raceway, of three catches two of which are adapted to engage each a separate paper and simultaneously move them from the pile, a third catch movable independently of the others and having a greater stroke, and adapted to engage and move the paper left by the intermediate catch, whereby three papers are in movement simultaneously in the operation of delivering them, the travel of each paper being so timed as to cause the independent catch to move a paper from the raceway while two other papers are being moved simultaneously into the raceway.

46. In a machine for sealing the edges of papers, the combination with means for carrying, pasting and sealing the papers, and a shelf or ledge and means for tilting it, of devices for feeding and delivering the papers to said shelf, consisting of a holder for a pile of papers, means for maintaining the pile under pressure, the catches 112 arranged to act in succession horizontally across the holder to engage and move the papers edgewise from the box, one in advance of the other intermittently, a raceway arranged in alinement with said catches, having a bottom and adapted to receive and support two of the papers side by side, one in advance of the other as they are fed from the holder, an independently-acting catch 115 arranged to act horizontally within said raceway and engage and deliver the papers therefrom in succession and means for operating said catches simultaneously and in succession.

47. In a device for feeding papers from a pile, a vertical raceway having walls adapted to hold two papers on edge side by side, the combination with said raceway, of a catch 114 adapted to engage and deliver a paper, and catches 112 112 movable together independent of the raceway-catch, for engaging each a paper and delivering it into said raceway whereby three papers are in movement at the

same time, the said raceway-catch having a greater stroke than the catches for moving the papers from the pile.

48. The combination with a holder adapted to maintain a pile of papers under pressure standing on edge, a fender closing the feed end of said holder, and a laterally-extending raceway in alinement with the inner wall of said fender and having a bottom trough 109, of catches 112 arranged to slide horizontally along the inner walls of said fender and adapted to engage the same paper by successive steps to carry it from said box into the raceway, a terminal catch 114, arranged to slide horizontally within the raceway and means for separately operating the said catches consisting of the pivotally-connected arms 118, 120, 121 and the crank 122, whereby three papers will be separately moved by successive steps from the pile to deliver each in succession from the raceway, and means for actuating the said crank.

49. The combination with a holder adapted to receive a pile of papers standing on edge, and a fixed fender or guard at the feed end of said pile, whereby the papers are supported in vertical position, of a multiple of feed catches or ledges arranged in separate and independent sets each set adapted to reciprocate and separately and independently engage the vertical edge of separate papers and slide them by successive steps from the pile; means for actuating said catches whereby the terminal catch will have a greater throw and greater speed of movement than the initial catch and means for maintaining the pile under pressure toward its feed end.

50. The combination with a holder adapted to receive a pile of papers, and a fixed fender or guard at the feed end of said pile, of feed-catches arranged in separate and independent sets each set adapted to reciprocate and separately engage the vertical edge of separate papers and slide them from the pile, and inclines arranged upon the floor of the holder, up which the papers ride and drop off into the way and for the purpose stated.

51. For feeding papers from a pile, a feed-box closed at its feed end by a fender or fence, and having a spring-pressed follower between which and the said fender, the pile of papers is supported on their folded edges, a series of inclines fixed in the bottom of the box in the line of the feed of the pile, whereby in advancing the pile over and upon the edges of the inclines the front paper will pass off the inclines at their highest edges and settle by gravity to the floor between the inclines and the fender, and means for feeding the paper edgewise out from the pile in contact with the vertical wall of the fender and the vertical ends of the said wedges.

52. For feeding papers from a pile standing on edge one by one edgewise from the pile, a feed device consisting of a box, having its feed end closed by a fender or fence formed of horizontal bars, a raceway extending from one side of said box opening therein and having its vertical walls formed of horizontal bars, catches adapted to reciprocate horizontally upon the inner vertical wall of the fender, a catch adapted for independent reciprocation horizontally within the raceway, means for independently actuating said catches whereby the papers are fed from the pile into the raceway, supported therein and slid therefrom upon their edges, and means for feeding the standing pile of papers broadside against the fender.

53. The combination, with a holder adapted to receive a pile of papers standing on their edges, a feeder or fence at the feed end of said holder consisting of horizontal fixed bars 107, a carrier 111 mounted upon said fence, catches 112 standing on the inner vertical wall of said carrier, a raceway formed of vertical walls extending from the side of said holder, having its outer wall in vertical alinement with the inner wall of the fender, the other wall of the raceway forming a junction with the feed-space of said holder, a carrier 15 mounted upon ways of the raceway-wall and having a catch standing on the inner side of said raceway, means for reciprocating the said catches, the raceway-catch independently of the feeder-catches, and a spring-pressed follower for feeding the pile of papers broadside into engagement with the fender-catches.

54. For feeding papers from a pile standing on edge one by one edgewise from said pile, the combination with a holder adapted to contain a pile of papers standing on edge, and a fender against which the pile of papers is fed broadside on, of a raceway opening into the holder at its side, the outer wall of the raceway being an extension crossing the path of the feed of the pile and supporting it, and a series of catches, certain of the catches movable together for engagement with separate papers within the chamber of the box, the other catch separately movable within the raceway and engaging a paper therein, whereby the papers are slid in succession upon their edges from the pile into the raceway and from the latter they are slid free from pressure one at a time.

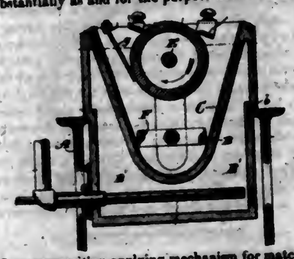
55. The combination in a machine for sealing the free edges of papers, of mechanism for carrying, pasting, sealing and delivering the sealed paper, with a holder having a fender and a spring-pressed follower for maintaining a pile of papers standing on edge under pressure against said fender, a raceway for the paper formed vertically at the side of said holder as a prolongation of its fender, devices movable on the inner wall of the fender and devices movable on the inner wall of the raceway for feeding the papers vertically edgewise from the holder and from the raceway, and means arranged between the carrying mechanism and the raceway operated and timed to receive the paper from the raceway and deliver it to the carrying mechanism in a direction at right angles to the travel of the feeding mechanism.

56. In combination, with the endless traveling belts arranged and operating to seize, support and carry the articles to be pasted and sealed between them, of pasters arranged and timed to operate to meet in contact with and on opposite sides of the article as its edges to be sealed are carried between the pasters, and means for applying a sealing-strip to the pasted edges.

57. For sealing the free edges of folded newspapers, the combination with mechanism whereby the article to be sealed, is seized, supported and carried in the operation of sealing and delivering it, and means for advancing and severing a sealing-strip in position to be engaged by the advancing paper, of means for applying paste to the opposite sides of the edge of the paper during its advancing movement to receive the sealing-strip.

58. For sealing the free edges of folded newspapers, the combination with mechanism whereby the article to be sealed, is seized, supported and carried in the operation of sealing and delivering it and means for advancing and severing a sealing-strip in position to be engaged by the advancing paper, of mechanism whereby paste is applied to both sides of the paper at its open edges and during its advancing movement to receive the sealing-strip, the said pasting mechanism consisting of the shafts 52, 53, one above and the other below the path of the paper, and each carrying a pasting-arm arranged to revolve in the same vertical plane in advance of the strip-supplying means, the gear 59, 59 and intermediate gear connecting the power-driven shaft whereby the pasters are caused to rotate at the same speed in the direction of the travel of the paper and to meet in engagement on the opposite sides of the paper, and suitable means for supplying the pasters with paste in their movements within a space between the rear edge of one paper and the advancing edge of the next paper.

59. For feeding papers from a pile standing edgewise, the combination, with a holder adapted to contain a pile of papers standing on edge, a fence or feeder against which the pile of papers is fed broadside on, and a vertical walled raceway at the side of and opening into the holder, of the carrier 111 mounted to slide upon the feeder, and having the catches 112, 112, the crank connections 121, 122 for actuating said carrier, the raceway-carrier 115 having the catch 114, the separate connections for actuating the raceway-carrier and means for actuating the said crank connections whereby to operate the said independent catches.



60. In a machine for sealing papers, the combination with means for carrying, pasting, and sealing the papers, and a tilting shelf or ledge for receiving and delivering the papers to the carrying mechanism, of a vertical raceway arranged in longitudinal alinement with said shelf and adapted to receive two papers side by side on edge, a feed device of three catches two of which are adapted to engage each a separate paper and simultaneously move them side by side from the pile, the third catch movable independently of the others and having a greater stroke than the two others, whereby three papers are in movement simultaneously in their delivery one at a time upon said shelf, means for actuating the catch of greater stroke relatively with the catches of less stroke, and means for actuating the shelf, the movements of which are timed in proper sequence with the movements of the catch of greatest stroke, in the way and for the purpose stated.

61. In a device for feeding papers from a pile, a vertical raceway adapted to receive two papers side by side on edge, the combination with said raceway, of a tilting shelf arranged in longitudinal alinement with said raceway and presented to receive the paper on its edge, a feed device of three catches, two of which are adapted to engage each a separate paper and simultaneously move them from the pile, the third catch movable independently of the others within the raceway and with a greater stroke, and means for actuating the several catches in unison with the tilting of the shelf in the way and for the purpose stated.

608,459. MATCH-MAKING MACHINE. JACOB P. WEBSTER, New Haven, Conn., assignor to the Diamond Match Company, Chicago, Ill. Filed Dec. 22, 1896. Renewed Oct. 7, 1897. Serial No. 654,577. (No model.)

Claim.—1. In a composition-applying mechanism for match-making machines, in combination with the receptacle for the composition and a moving feeder moving partly in and partly above the composition, a clearer extending down into the composition, with its lower end close to the feeder, and having a series of narrow openings for the passage of the composition, substantially as and for the purpose specified.

2. In a composition-applying mechanism for match-making machines, in combination with the receptacle for the composition, the rotary roller partially submerged in the body of the composition in the receptacle, and the clearer having a series of fingers with their ends submerged in the composition close to the periphery of the roller, substantially as and for the purpose described.

3. In a composition-applying mechanism for match-making machines, in combination with the receptacle for the composition, the rotary roller partially submerged in the body of the composition in the receptacle, and the clearer having a series of fingers, with narrow spaces between them, extending down into the body of the composition, with their lower ends close to the periphery of the roller, substantially as and for the purpose set forth.

4. In a composition-applying mechanism for match-making machines, in combination with the receptacle for the composition and the rotary roller partially submerged in the body of the composition, the clearer consisting of a bar suitably supported and extending across the space within the receptacle and a series of fingers extending downward and inward toward the roller, to a point below the top of the body of composition, and having their lower ends close to the periphery of the roller, substantially as and for the purpose shown.

608,460. HOSE-COUPLING. FREDERICK A. WOODERLIN, Brooklyn, N. Y. Filed July 22, 1897. Serial No. 645,494. (No model.)

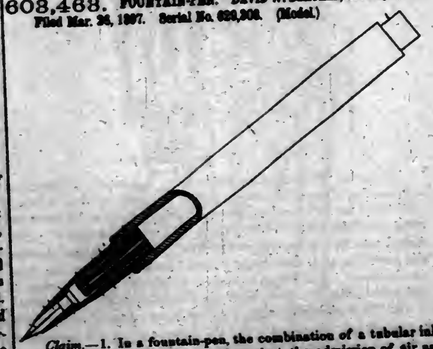
Claim.—1. In hose-couplings the bushing as A, adapted to be secured within a rubber tube, having an annular seat in its interior as a in combination with a plunger as B provided with a shoulder as *b*, the shank *b'* passing through and extending beyond the bushing A, and the threaded connecting-nipple as C fastened to the free end of shank *b'* substantially as shown and described.

2. A hose-coupling consisting of the following three parts, namely: a hollow body-bushing adapted to be secured within a rubber tube, a plunger consisting of a piston and shank, the plunger being centrally positioned within the bushing so as to permit a free sliding and revolving movement, and a threaded nipple soldered or secured on the projecting end of the shank, substantially as shown and described.

3. In a hose-coupling the combination of a bushing as A adapted to be secured within a rubber tube, said bushing having one end portion of a smaller internal diameter than the other end, the difference in these two diameters forming an internal annular seat; of a hollow plunger as B provided with a shoulder and having a shank which passes through and extends beyond the smallest internal diameter end of bushing A and of a threaded nipple as C secured to the said shank, all combined in the manner set forth and described.

608,461. APPARATUS FOR PREVENTING KETTLES BOILING DRY. FREDERICK G. VETTER, Greenfield, Mass. Filed Jan. 6, 1898. Serial No. 665,796. (No model.)

Claim.—In an apparatus for preventing kettles or steamers boiling dry, consisting of the tank described provided with the well and tubing extending through its bottom and the float, combined with the cover having an enlarged aperture therein on which cover the tank is designed to rest, and through which aperture the said tubing and well pass, the tubing and the valve mounted therein, the lever pivoted to the upper end of the extension of the wall, and connections between the same and the valve and float, as shown and for the purpose set forth.



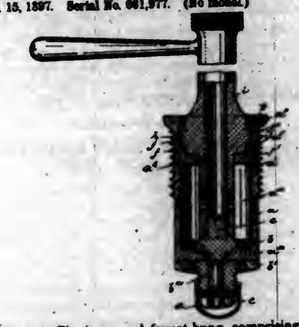
608,462. MEANS FOR MANUFACTURING TWIST-DRILLS. ROBERT L. RAMSAY, Plattekill, N. Y. Filed June 8, 1896. Serial No. 594,770. (No model.)

Claim.—1. In means for use in making a twist-drill, the rolls A, A, for forming at one pass the flutes or grooves in the blank, said rolls each having a die-face *a*, convex in cross-section and corrugated or wavy in the direction of its length, substantially as set forth.

2. In means for use in making a twist-drill, the rolls A, A, for forming the longitudinal flutes or grooves in the opposite faces of the blank, said rolls having each a die-face *a*, convex in cross-section and corrugated or wavy in the direction of its length, said corrugations running out at the lateral edges of the die-face in order that the cutting edges z^2 of the drill along the margins of the flute therein may be formed straight and true, substantially as set forth.

608,468. FOUNTAIN-PEN. DAVID W. BRAUNER, Brooklyn, N. Y. Filed Mar. 26, 1897. Serial No. 629,908. (Model.)

Claim.—1. In a fountain-pen, the combination of a tubular ink-reservoir closed at its upper end against the admission of air and open at its lower end, an open-ended tubular nozzle mounted upon the open end of said reservoir and formed at its outer end with a comparatively small-sized bore for retarding the free outflow of ink from the nozzle, and a comparatively small-sized slit writing-pen having its body mounted within and across the said bore of the nozzle and dividing the same longitudinally throughout the length of the body of the inserted pen into upper and lower passages adjacent the pen, the nibs projecting from the mouth of the nozzle with the slit thereof extending within the bore thereof and the said passages themselves constituting the means for feeding the ink from the reservoir to the nibs of the pen, substantially as and for the purpose set forth.

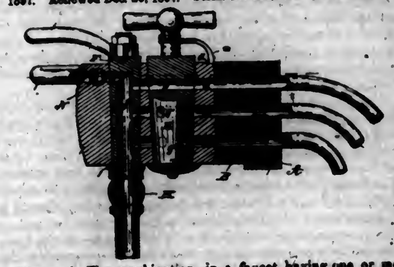


2. In a fountain-pen, the combination of an ink-reservoir closed at its upper end, an ordinary tubular nozzle mounted upon the lower end of said reservoir, a writing-pen provided with nibs and set in the bore of said nozzle with the nibs thereof projecting from the mouth of the nozzle and extending inwardly within the bore thereof, said pen dividing said bore longitudinally whereby there is constituted above and below said pen a free passage to the heel thereof and in communication with the reservoir, and a plug provided with air and ink passages mounted in the bore of said nozzle at the inner end thereof for regulating the flow of ink from the reservoir to the pen, substantially as and for the purpose set forth.

3. In a fountain-pen, the combination of an ink-reservoir closed

at its upper end, an ordinary tubular nozzle mounted upon the lower end of said reservoir, and a writing-pen provided with nibs and set in the bore of said nozzle with the nibs thereof projecting from the mouth of the nozzle and extending inwardly within the bore thereof, said pen dividing said bore longitudinally whereby there is constituted above and below said pen a free passage to the heel thereof and in communication with the reservoir, and a plug channeled or cut away longitudinally to provide air and ink passages throughout its length and set in the bore of said nozzle at the inner end thereof, said plug being capable of being turned on its axis to change the angular position of the ink-passages thereof and vary the relation of the same to the plane of the pen, substantially as and for the purpose set forth.

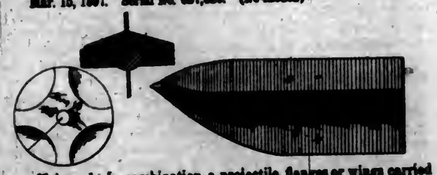
4. In a fountain-pen, the combination of a tubular ink-reservoir closed at its upper end against the admission of air and open at its lower end, an open-ended tubular nozzle mounted upon the open end of said reservoir and having the diameter of the bore at its outer end comparatively small and less than that at the inner end, the diameter of the bore at said inner end of the nozzle being less than that of the said ink-reservoir, and a comparatively small-sized slit writing-pen mounted in the outer end of the nozzle within the smaller bore thereof and dividing the same into upper and lower passages adjacent the writing-pen, the nibs of the writing-pen projecting from the mouth of the nozzle with the slit thereof extending within the bore and the said passages themselves constituting the means for feeding the ink to the nibs of the writing-pen, substantially as and for the purpose set forth.



608,464. FAUCET-BUNG. DILLON BERRY, Newark, N. J. Filed Dec. 15, 1897. Serial No. 661,977. (No model.)

Claim.—1. The improved faucet-bung, comprising a cylindrical body having exterior threads at or near its upper or outer ends and a valve-seat at its lower or inner end, the said body at its outer end being provided with an enlarged chamber and shoulder a^4, a cup-shaped seat for the key-spigot fitting within said enlarged chamber and providing an inward flange f', semicircular grooves j, and opposite openings g, and valves arranged to engage said valve-seat, all said parts being arranged and combined, substantially as set forth.

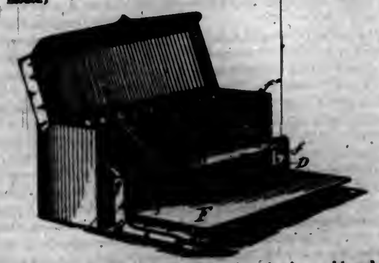
2. The combination with a faucet-bung body, of a cylindrical key-spigot seat arranged within the outer end of said faucet-bung body and providing an inward flange f', and opposite openings g, and semicircular grooves j, on the inside, the said seat being imperviously fixed within said body, substantially as set forth.



608,465. LIQUID-DISTRIBUTING FAUCET AND PIPE-CLEANER. JOSEPH F. DREDGE and JOHN DOYLE, Connersville, Ind. Filed Mar. 9, 1897. Renewed Dec. 29, 1897. Serial No. 664,445. (No model.)

Claim.—1. The combination, in a faucet having one or more supply-inlets, and a single discharge, of a discharge-valve having a central longitudinal outlet with openings which register at certain positions of the valve with the supply inlet or inlets, a cock for closing the valve, a water-supply pipe emptying into the longitudinal outlet of the discharge-valve and a cock for turning the water-supply on or off, substantially as described and for the purposes specified.

2. The combination, in a faucet having a plurality of supply-inlets and a single discharge, of a discharge-valve having a central longitudinal outlet, communicating in the open or discharging position of the valve with all of the supply-passages, a cock for closing the valve, and a second valve parallel with the discharge-valve intersecting the inlet-passages before they reach the discharge-valve, said second valve having transverse, diametrically-placed openings, one for each supply-passage and registering therewith successively when brought into alinement by rotating the valve, whereby liquids from a plurality of tanks can be discharged through a single outlet, and a water-supply pipe emptying into the longitudinal outlet of the discharge-valve, and a cock for turning the water-supply on or off, all substantially as shown and described and for the purposes specified.

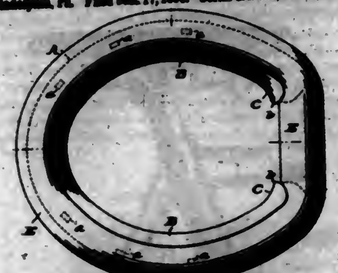


608,466. PROJECTILE. JOHN H. HANNER, Allegheny, Pa. Filed Mar. 15, 1897. Serial No. 627,620. (No model.)

Claim.—1. In combination, a projectile, flanges or wings carried by said projectile, a protecting-jacket surrounding said flanges or wings and engaging the same, a removable head provided with a lug engaging and opening in the end of the projectile, substantially as shown and described.

2. In combination, a projectile provided with wings or flanges, a protecting-jacket engaging said flanges, and a removable head engaging the rear end of the projectile, substantially as shown and described.

608,467. MEDICINE-CASE FOR PHYSICIANS. MARGARET HOYT, Brooklyn, N. Y. Filed Dec. 15, 1897. Serial No. 661,988. (No model.)

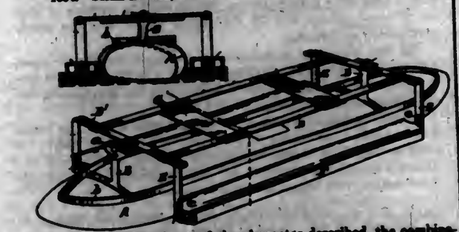


Claim.—1. The combination of a box, having a hinged front wall, bracket-supports attached to the inside of said front wall, and a bottle-carrying leaf pivoted only to the ends of and freely swinging on said supports and adapted to be folded parallel with the said front wall or supported in rearward forwardly-inclined position, substantially as set forth.

2. The combination of a box, having a hinged front wall, bracket-supports attached to the inside of said front wall, a freely-swinging leaf pivoted only to said supports, and a second freely-swinging leaf provided with arms pivoted to said supports, said leaves being adapted to support bottles or the like and to swing parallel with the front wall in its inward or outward position, and said second leaf being adapted to be folded over onto the other leaf, so that each leaf may be exposed separately, substantially as set forth.

3. The combination of a box having a hinged front wall, a row of bottles supported on the rear wall, bracket-supports attached to the inside of said front wall, and a leaf pivoted to the said supports, said leaf being adapted to carry a row of bottles and to be supported by its free edge on said first row of bottles, substantially as set forth.

4. The combination of suitable supports, a leaf pivoted at its opposite ends to said supports only, and a second leaf provided with arms pivoted at their outer ends only to the supports, said leaves being adapted to be separately moved into and be supported in rearwardly and upwardly inclined position, substantially as set forth.



608,468. ELASTIC-TREAD HORSESHOE. WILLIAM B. HOPKINS, Philadelphia, Pa. Filed Jan. 17, 1898. Serial No. 667,247. (No model.)

Claim.—1. The combination, with the base-plate, of a concave retaining-wall arranged around the inner periphery thereof; and a rubber ring having a normal diameter less than the diameter of said wall and adapted to be sprung into position over the latter and retained thereon by its own tension without the use of positive holding devices, substantially as described.

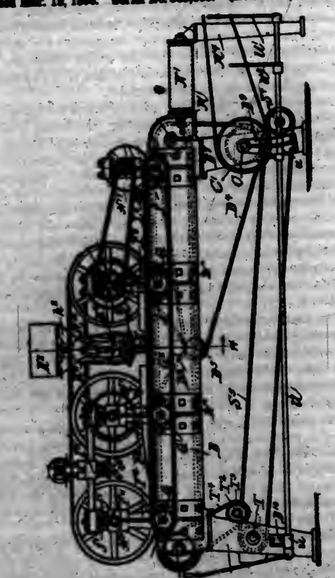
2. The combination, with the base-plate, of a concave retaining-wall arranged around the inner periphery thereof, said wall diverging inwardly at its extremities and terminating in rounded lips arranged with relation to one another, substantially as set forth; and a rubber ring having a normal diameter less than the diameter of said wall, and adapted to be sprung into position and retained thereon by its own tension without the use of positive holding devices, substantially as described.

608,469. BOAT. JOSEPH KAUFF, Detroit, Mich. Filed Sept. 30, 1897. Serial No. 653,203. (No model.)

Claim.—1. In a boat of the character described, the combination with the hull, of the supporting-frame mounted on the hull and carrying the seats for the occupants of the boat, the hollow ballast-floats open at each end pivoted to the bars depending from said supporting-frame and adapted to revolve.

2. In a boat of the character described, the combination with the hull, the standards rising from the deck thereof, the supporting-frame pivotally mounted on said standards and having the four depending bars provided with slots in their lower ends, and the hollow ballast-floats having an opening therethrough and journaled in said slots.

608,470. FURNACE FOR HEATING RIVETS OR FOR SIMILAR USES. ANDREW H. LAIMBEER and FRED J. LAIMBEER, New York, N. Y. Filed Jan. 17, 1898. Serial No. 667,014. (No model.)



Claim.—1. In a furnace for heating rivets, &c., the combination with a metal floor-plate, of a metallic box having a permanently-closed bottom, an open front, an opening at its outer side, and a perforated arched top or crown serving as the grate or the fuel-support, such box being inserted in the brick-work of the furnace and resting on said floor, a door on the furnace for closing the front of the box, and an opening in the side of the brick-work coinciding with the said opening in the box, and communicating with a blast-pipe adapted for discharging compressed air horizontally and directly into the box under the whole surface of its crown, as shown and described.

2. In combination with the air-box 7, having the closed bottom, open front, apertured side and arched perforated crown, the described combustion and heating chambers, the bottom plate 2 beneath them, the low wall between them, the guideways or uncoupled counter-weighted swing-doors 12, 13ˣ at front and rear of the heating-chamber and arranged to freely swing outward by the pressure of internal gases, all as shown and described.

3. A portable furnace having a combustion-chamber and a heating-chamber 5, provided with a bottom plate 2, and with the metal box located underneath the combustion-chamber and side by side with but a co plane lower than that of the heating-chamber, and having a low brick wall between said chambers, and counterweighted doors at the ends of such chambers, adapted under undue internal pressure automatically to swing outward, and also to slide vertically without guideways, and serving by their own gravity to swing back to place and to hug tightly against the furnace to close its end openings, all as set forth.

4. The described rivet-heating furnace, having a skeleton angle-iron frame, a metal floor and brick-work supported thereon, the parallel chambers 4 and 5, the arched roof over both, the low bridge-wall, the air-box 7, inserted in an opening at the bottom of the combustion-chamber 4, and made with an open front, a thick and perforated arched crown or top, serving as a bed for the fuel, a closed bottom, an opening in its side, and a blast-pipe discharging into the box through such opening, and counterweighted swing-doors at front and rear of the heating-chamber, these parts being combined and operating as set forth.

608,471. PAPER-BOX MACHINE. JOHN W. LOW, Chicago, Ill. Filed Mar. 19, 1898. Serial No. 673,898. (No model.)

Claim.—1. A machine for folding and pasting box-blanks comprising stationary tracks or ways, crom-slats pivotally connected with each other to form an endless traveling carrier and provided with rollers which run on said ways, feed belts and pulleys located above said carrier, stationary folders located at opposite sides of the carrier for bending the marginal part of the blank, pasting mechanism acting on one of the bent margins of the blank after the same has been acted upon by the folders, means for folding the marginal parts of the blanks to bring their edges together, and pressing mechanism for pressing together the pasted edges.

2. A machine for folding and pasting box-blanks comprising an endless traveling carrier, a traveling pressure device located over the same, stationary folders located at the side of said traveling pressure device for bending the edges of the blank upwardly, means located

in position to act on the blank after it has passed said folders, for applying paste to one of the upwardly-bent edges of the blank, said means embracing a paste-applying roller, and guide-rollers for holding the edge of the blank in contact with the paste-applying roller, means for folding the parts of the blank to bring the edges thereof together, and pressing mechanism for pressing together the pasted edges.

3. A machine for folding and pasting box-blanks comprising an endless traveling carrier, a traveling pressure device located over the same, stationary folding-guides located at the sides of said traveling pressure device, a pasting mechanism located in position to act on the blanks after they have passed the said folders and comprising a paste-applying roller, and guide-rollers adapted to hold the edge of the traveling blank in contact with the paste-applying roller, means for folding together the pasted edges of the blank, and a pressing mechanism for pressing together the said pasted edges.

4. A machine for folding and pasting box-blanks comprising feed mechanism for giving movement to the blanks, means for folding the marginal parts of the blank at right angles to the central part, and means for folding said marginal parts to bring their edges together comprising pulleys turning on vertical axes at the sides of the path of the blank, other pulleys mounted on horizontal axes and overhanging the path of the blank, and belts trained over said pulleys.

5. A machine for folding and pasting box-blanks comprising an endless traveling carrier, a traveling pressure device located over the carrier, stationary folding-guides located at the sides of said traveling pressure devices, and means for folding down the marginal parts of the blanks comprising pulleys mounted on vertical axes at the sides of the carrier, other pulleys mounted on horizontal axes and located over the carrier, and belts trained over said pulleys.

6. A machine for folding and pasting box-blanks comprising a machine-frame, an endless traveling carrier, a traveling pressure device comprising shafts located over the carrier-belt, pulleys on the shafts, and belts on said pulleys, the pulleys at one side of the carrier being movable laterally on the shaft, standards for supporting the shafts, which are at one side of the carrier, constructed to slide laterally on the machine-frame, connections between said standards and the laterally-movable pulleys by which the pulleys are moved with the standards when the latter are shifted on the frame, and folding-guides for the blank of which those at one side of the carrier are attached to and move with the said standards.

7. A machine for folding and pasting box-blanks comprising a machine-frame, an endless traveling carrier, a traveling pressure device comprising shafts located over the carrier-belt, pulleys on the shafts, and belts on said pulleys, the pulleys at one side of the carrier being movable laterally on the shaft, standards for supporting the shafts, which are at one side of the carrier, constructed to slide laterally on the machine-frame, connections between said standards and the laterally-movable pulleys by which the pulleys are moved with the standards when the latter are shifted on the frame, and folding-guides for the blank, of which those at one side of the carrier are attached to and move with the said standards, and actuating devices attached to the several standards whereby the same may be moved at one time.

8. The combination with feed mechanism and folding mechanism, embracing folders which are laterally adjustable to correspond with the width of the blank, of pasting mechanism embracing a paste-applying roller, and means for supplying paste thereto, said pasting mechanism being vertically adjustable to correspond with the width of the folded margin of the blanks.

9. The combination with folding devices of pasting mechanism comprising a paste-receptacle, a paste-receiving roller located beneath the discharge-opening of the paste-receptacle and turning on a horizontal axis, a paste-conveying belt, two supporting-pulleys for the belt, one of which is mounted on a vertical axis and the other on a horizontal axis, and guide-pulleys engaging said belt between the two pulleys last mentioned.

10. The combination with an endless traveling carrier of means for folding inwardly the marginal parts of a blank resting on the carrier comprising two pulleys mounted on vertical axes at either side of the carrier, two pressure-pulleys mounted on horizontal axes over the carrier, belts trained over said pulleys, and two guide-pulleys mounted on horizontal axes in the same plane with the pressure-pulleys.

603,472. SADDLE-POST. ALBERT E. MCGILL, Chicago, Ill. Filed Nov. 27, 1896. Serial No. 613,578. (No model.)

Claim.—1. In a saddle-post for vehicles, the combination of a saddle-post made in two plano-convex wedge-shaped portions, and means for operating the parts to cause the proper engagement or disengagement, substantially as described.

2. In a saddle-post for vehicles, the combination of a post formed of two plano-convex wedge-shaped portions, a head on one of such portions, a rod on the other of such portions, and a lever arranged on the head and in contact with the rod so that its operation tends to move the parts and cause the proper engagement or disengagement, substantially as described.

3. In a saddle-post for vehicles, the combination of a saddle-post formed of two plano-convex wedge-shaped portions, a head on one of such portions, a rod on the other portion extending above the head, the head portion arranged and adapted to receive the spring or springs of a saddle, a projection on such head portion, a cam-lever straddling such projection and arranged to contact the rod and to grasp the saddle-spring between its cam-shaped portions and the head portion so that its operation tends to cause the engagement or disengagement of the saddle-post with a vehicle-frame and a saddle with the saddle-post, substantially as described.

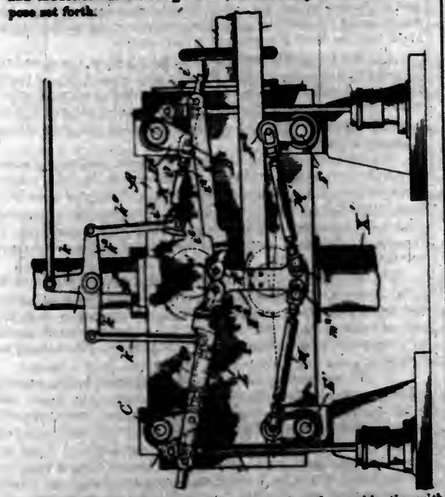
603,473. MANTLE FOR INCANDESCENT GAS-BURNERS. HIERICH P. D. OELRAVER, Hamburg, Germany. Filed July 15, 1897. Serial No. 644,705. (No model.)

Claim.—1. A mantle or the like for incandescent burners, composed of thorium and cerium oxid, containing silicic acid for the purpose of improving the duration of illumination, the emission of light, the fireproof quality, and the strength of resistance of the mantle substantially as described.

2. The process of manufacturing mantles or the like for incandescent burners, consisting in impregnating a fabric with a solution of thorium, cerium and silicic acid and burning the impregnated fabric, substantially as set forth.

3. The process of manufacturing mantles or the like for incandescent burners, consisting in precipitating silicic acid within the fibers of the fabric, impregnating the fabric with a solution of thorium and cerium salts, and then burning out the fabric, substantially as set forth.

603,474. IRONING-TABLE. JOHN G. SEIBOLD, New York, N. Y. Filed June 10, 1897. Serial No. 640,208. (No model.)



Claim.—1. The combination with an ironing-board, of the two sets of tubular, telescopic legs, both of which are hinged to the board and in one of which the legs converge and unite in a perforated lug having a detachable connection with the board.

2. The combination with an ironing-board, of the tubular legs, telescopic extensions of said legs, permanent connections between one set and the board, the legs of another set converging and uniting in a perforated lug, a member secured to the board, and a removable pintle passing through said lug and member.

603,475. CUT-OFF MECHANISM FOR STEAM-ENGINES. JOHN STUMPF, Chicago, Ill. Filed Oct. 23, 1896. Renewed Feb. 9, 1898. Serial No. 669,712. (No model.)

Claim.—1. In a cut-off mechanism for steam-engines the combination with the steam-cylinder and piston, of a vibratory bar movable under the action of the piston and having an impact-piece pivotally attached thereto, an induction-valve-opening device in position to be engaged, moved and released by said impact-piece, an engine-governor operatively connected with said device, to adjust it in the path of said impact-piece and thereby regulate the time of engagement of the impact-piece with said device, and induction-valve-closing means, substantially as and for the purpose set forth.

2. In a cut-off mechanism for steam-engines the combination with the steam-cylinder and piston, of a vibratory bar having impact-pieces pivotally attached thereto at opposite sides, induction-valve-opening devices in position respectively, to be engaged alternately and moved and released by the respective impact-pieces, an engine-governor operatively connected with said devices to adjust them simultaneously in the paths of the said impact-pieces and thereby regulate the time of engagement of the impact-pieces with the devices, and induction-valve-closing means, substantially as and for the purpose set forth.

3. In a cut-off mechanism for steam-engines the combination with the steam-cylinder and piston, of a vibratory bar having an impact-piece pivotally attached thereto and movable at said piece about an endless course under the action of the piston, an induction-valve-opening device adjustable as to length and in position to be engaged at its end, moved and released by said impact-piece, an engine-governor operatively connected with said device to adjust it at its end more or less into the path of said impact-piece and thereby regulate the time of engagement of the impact-piece with said device, and induction-valve-closing means, substantially as and for the purpose set forth.

4. In a cut-off mechanism for steam-engines, the combination with the steam-cylinder and piston, of a rotary induction-valve provided with returning means for moving it normally to one position, a vibratory bar movable under the action of the piston and having an impact-piece pivotally attached thereto, a device eccentrically connected with said valve and extending into the path of said impact-piece to be engaged and moved thereby, to turn said valve from normal position, and then release, to permit the valve-returning means to act, and an engine-governor operatively connected with the cut-off mechanism to regulate the time of engagement between the said impact-piece and device in each operation, substantially as described.

5. In a cut-off mechanism for steam-engines the combination with the steam-cylinder and piston of a rotary induction-valve provided with closing means, a vibratory bar movable under the action of the piston and having an impact-piece pivotally attached thereto, a valve-opening device eccentrically connected toward one end with the valve and provided at its opposite end with a face at which it projects into the path of the said impact-piece to be engaged, moved and released thereby, and an engine-governor operatively connected with said device to adjust the end face thereof in the path of said impact-piece and thereby regulate the time of engagement of the said impact-piece and end face in each operation, substantially as and for the purpose set forth.

6. In a steam-engine, the combination with the steam-cylinder, its induction-valves, the piston and governor, of closing means for the said valves, a vibratory bar having impact-pieces pivotally attached thereto adjacent to the cylinder and actuated from the piston to travel an endless course and operatively connected with the induction-valves, induction-valve-opening devices in position, respectively, to be engaged alternately and moved and released by the respective impact-pieces, and a governor actuated from the piston and operatively connected with the said devices to adjust them in the paths of said impact-pieces and thereby regulate the time of engagement of the impact-pieces with the devices, substantially as and for the purpose set forth.

7. In a steam-engine the combination with the steam-cylinder, piston and governor, of a rotary induction-valve at the said chamber, valve-closing means, a vibratory bar, operatively connected at one end with the piston to travel an endless course at its opposite end adjacent to the cylinder and having at the latter end an impact-piece pivotally attached thereto, a valve-opening bar eccentrically connected with said valve toward one end and extending at its opposite or free end into the path of said impact-piece, to be engaged and moved longitudinally thereby, to open the valve, and then released, and suspending means for the bar connected with the free end portion thereof, and operatively connected with the governor to adjust the bar in the path of said impact-piece, under the action of the governor, and thereby regulate the time of engagement between said impact-piece and bar, substantially as and for the purpose set forth.

8. In a steam-engine the combination, with the piston-chamber, piston and governor, of a rotary induction-valve at the said chamber, valve-closing means, a valve-opening bar eccentrically connected with the valve, a head operatively connected with the piston to travel an endless course, a plunger pivotally connected at one end with said head and movably supported at the other end, and provided with an impact-face to engage, move and release said bar, the bar being operatively connected with the governor to be adjusted thereby in the path of said impact-face to regulate the time of engagement of the said face with the bar in each operation, substantially as and for the purpose set forth.

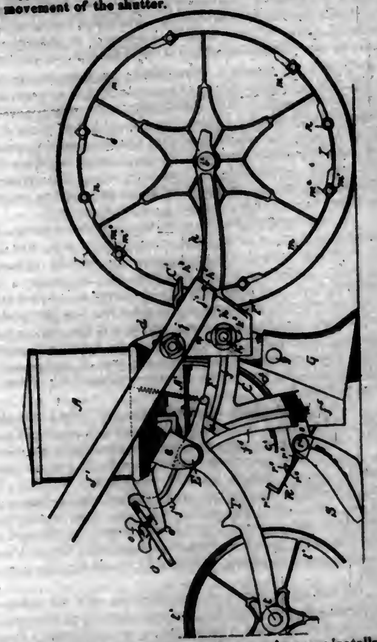
9. In a steam-engine, the combination, with the piston-chamber, piston and governor, of a rotary induction-valve at the said chamber, valve-closing means, a valve-opening bar eccentrically connected with the valve, a head operatively connected with the piston to travel an endless course, a plunger pivotally connected at one end with said head and sliding upon said bar and provided with an impact-face to engage, move and release said bar, the bar being operatively connected with the governor to be adjusted thereby, in the path of said impact-face, to regulate the time of engagement of the said face with the bar in each operation, substantially as and for the purpose set forth.

10. In a steam-engine, the combination, with the piston-chamber, piston and governor, of a rotary induction-valve at the said chamber, valve-closing means, a valve-opening bar eccentrically connected with the valve, a head operatively connected with the piston to travel an endless course, a plunger pivotally connected at one end with said head and sliding upon said bar and provided with an impact-face to engage, move and release said bar, suspending means for the bar operatively connected with the governor and movable under the action thereof to adjust the bar in the path of said impact-face and thereby regulate the time of engagement of the face and bar in each operation, substantially as and for the purpose set forth.

11. In a steam-engine, the combination with the piston-chamber, piston, shaft, governor, induction-valve and induction-valve-closing means, of a vibratory bar eccentrically connected at one end with the shaft, having an impact-piece pivotally attached thereto toward its opposite end adjacent to the cylinder and pivotally and shiftingly supported between its ends, an induction-valve-opening device in position to be engaged, moved and released by said impact-piece, and operatively connected with the governor to be adjusted thereby in the path of said impact-piece and thus to regulate the time of engagement of the impact-piece with the said device in each operation, substantially as and for the purpose set forth.

603,476. DISTRIBUTER FOR SEEDS AND FERTILIZERS. SAMUEL L. ALLEN, Moorestown, N. J. Filed May 10, 1897. Serial No. 636,958. (No model.)

Claim.—1. In a seed-sowing machine, a movable seed-discharge shutter having a fixed range of movement, means for operating the same, a hopper, and means for adjusting the hopper relatively to the shutter to regulate the quantity of seed to be discharged at each opening of the shutter.



2. In a seed-sowing machine, a pivotally-movable hopper, a discharge-orifice in said hopper, means for opening and closing said discharge-orifice for regulating the discharge of the seed, and means for adjusting the position of the hopper to govern the area of the discharge-orifice.

3. In a seed-sowing machine, a movable hopper, a movable seed-discharge shutter, means for operating said shutter, and means for adjusting the position of said hopper to regulate the quantity of seed to be discharged at each opening of the shutter.

4. In a seed-sowing machine, a frame, a hopper pivoted thereto having a bottom discharge-opening, a shutter normally closing said opening, means for reciprocating said shutter, and means for adjusting the position of the hopper.

5. A seed-sowing machine having an adjustable hopper, a movable shutter at the bottom of said hopper, devices for operating said shutter to discharge the seed, and means for adjusting the position

of the hopper to regulate the area of the discharge-opening effected by the movement of the shutter.

6. In a seed-sowing machine, a frame, a hopper pivotally connected thereto and having at its bottom a seed-discharge opening, a movable shutter normally closing said opening, means for operating said shutter to discharge the seed, and means for adjusting the position of the hopper to regulate the area of the discharge-opening effected by the movement of said shutter.

7. In a seed-sowing machine, a frame, a hopper having a lower seed-discharge channel terminating in a V-shaped end, and a movable discharge-shutter arranged under the seed-discharge channel and having a recessed or slotted end portion, the ends of the seed-discharge channel and the shutter coacting to form a diamond opening for the discharge of the seed.

8. In a seed-sowing machine, a hopper having at its point of discharge a recessed or V-shaped opening, a shutter having a recessed or V-shaped opening adapted to be moved to alternately close and open the hopper discharge-opening, and means for actuating said shutter.

9. In a seed-sowing machine, a hopper recessed at the point of discharge, in combination with a shutter having a recessed end adapted to be moved to close or open the hopper-discharge.

10. In a seed-sowing machine, a hopper having a lower seed-discharge channel, a movable shutter forming one wall of the channel, and means for actuating said shutter to form a seed-discharge opening between the end of the shutter and the end of the seed-discharge channel.

11. In a seed-sowing machine, a hopper having a lower seed-discharge channel, a movable shutter forming one wall of said channel, means for actuating said shutter to form a seed-discharge opening between the end of the shutter and the end of the seed-discharge channel, and a regulating-cam for adjusting the area of the discharge-opening.

12. In a seed-sowing machine, a hopper having a seed-discharge channel provided at its lower end with an inclined cross-bar, in combination with a seed-discharge shutter having at its end a recess or slot and adapted to be moved across said inclined bar to alternately open and close the seed-discharge opening.

13. In a seed-sowing machine, a hopper having at its lower end a seed-discharge channel formed partly by the hopper-walls and partly by a movable shutter, with means for actuating said movable shutter to form between the fixed walls of the channel and the end of the shutter a seed-discharge opening.

14. In a seed-sowing machine, a hopper having at its lower end a seed-discharge channel having two fixed walls and two movable walls, one of each movable walls forming a seed-discharge shutter with means for actuating said shutter, substantially as specified.

15. In a seed-sowing machine, a hopper having a seed-discharge channel, a movable shutter forming one wall of the channel, means for actuating said shutter to form a seed-discharge opening between the end of the shutter and the end of the discharge-channel, the upper end of said shutter projecting within the hopper and forming a seed-stirrer.

16. In a seed-sowing machine, a hopper having a seed-discharge channel, a movable shutter forming one wall of such channel, means for actuating said shutter to form a seed-discharge opening between the end of the shutter and the end of the discharge-channel, and means for adjusting the positions of both the hopper and the shutter and for regulating the limit of movement of such shutter.

17. In a seed-sowing machine, a frame, a hopper, A, a pivot-bolt, E, connecting the hopper to the frame, a seed-channel formed partly by the lower walls of the hopper and partly by sliding plates, c', c^2, the end of the lower plate, c^2, having a slot or recess, c^4, adapted to form a seed-discharge opening and means for actuating said plate, c^2, substantially as specified.

18. The combination of the frame, a hopper, side bars, b, formed on said hopper, an inclined bar, b', connecting said side bars, a seed-discharge shutter comprising sliding plates, c', c^2, adapted to reciprocate on said side bars, the lower plate, c^2, being provided at one end with a slot or recess, c^4, which in connection with the said bar, b', forms a seed-discharge opening, and means for actuating said shutter, substantially as specified.

19. In a seed-sowing machine, a frame, a hopper having at its lower portion a seed-discharge channel, a combined discharge-shutter and seed-stirring device comprising plates, c', c^2, arranged on either side of and forming movable walls for the seed-channel, and means for reciprocating said shutter and stirring device, substantially as specified.

20. In a seed-sowing machine, a frame, a hopper having a lower seed-discharge channel formed partly by the walls of the hopper and partly by movable plates, c', c^2, which extend up into the hopper and serve to agitate the seed therein, a shutter-frame, C, embracing and surrounding the seed-channel and to which said plates, c', c^2, are secured, a projecting finger, C', secured to or formed integral with the shutter-frame, means for guiding said frame and finger, and means for raising the finger to effect the reciprocation of the shutter, substantially as specified.

21. In a seed-sowing machine, a frame, a hopper having a lower seed-discharge channel formed partly by bars, b, b', integral with the hopper and partly by sliding plates, c', c^2, a shutter-frame and finger, C, C', carrying said plates, a slotted guide, d, projecting from the hopper a pin, d', carried by the shutter structure and extending through said slot, an actuating-wheel, and a series of pins on said wheel adapted to operate on said finger to effect the reciprocation of the shutter, substantially as specified.

22. In a seed-sowing machine, a frame, a hopper pivoted thereto and provided with a lower seed-discharge channel, a movable shutter, means for reciprocating said shutter to form at the end of the seed-channel a discharge-opening, and a cam, O, for moving said hopper on its pivot to adjust the relative positions of the end of the seed-channel and the end of the shutter, substantially as specified.

23. In a seed-sowing machine, a frame, a hopper pivoted thereto, a cam pivotally secured to the frame and adapted to coact with a fixed portion of the frame to effect the pivotal adjustment of the hopper, a seed-discharge channel at the lower end of the hopper formed partly by fixed side and end walls, b, b', and partly by sliding plates, c', c^2, adapted to reciprocate on said side bars, the lower plate, c^2, being provided with a slot or recess, c^4, which in connection with the end bar, b', forms a seed-discharge opening, and means for actuating said shutter, substantially as specified.

24. In a seed-sowing machine, having a hopper pivotally connected to the frame of the machine and adapted to be raised or lowered at will upon the frame, mechanism for automatically closing the seed-discharge opening when the hopper is raised to its full extent upon the frame.

25. In a seed-sowing machine, a frame, handles thereon, a seed-hopper pivoted to said frame, a discharge-shutter provided at the bottom of the hopper, a driving-wheel adapted to operate the said shutter, and a covering-roller hung to the rear end of the frame and adapted on the raising of the handle to disconnect the driving-wheel and the discharge-shutter.

26. A seed-sowing machine, comprising a frame, a driving-wheel carried thereby, a seed-hopper pivoted to the frame, a discharge-shutter carried by the hopper and adapted to be operated by the driving-wheel, a covering-roller pivotally hung to the frame and adapted to elevate the hopper when the handles are raised and thereby disconnect the shutter-operating mechanism.

27. In a seed-sowing machine, a frame, a seed-hopper pivoted thereto, a discharge-shutter for governing the discharge of the seed, a driving-wheel adapted to operate upon said shutter, a covering-roller hung to the rear end of the frame, and lever-arms extending beyond the pivot-point of the covering-roller frame and adapted to raise the hopper and its shutter from contact with the shutter-actuating mechanism when the handles are raised.

28. In a seed-sowing machine, a frame, a hopper pivoted thereto, projections as d', extending laterally from the sides of the hopper, seed-discharge mechanism comprising a movable shutter and a driving-wheel having projections adapted to engage with and actuate the same, a covering-roller, a frame, T, pivoted to the frame and carrying said roller, arms, t', secured to or formed integral with the roller-frame and extending beyond its pivot-point, said arms being adapted to engage with the projections, d', when the handles are raised.

29. In a seed-sowing machine, a hopper, means for discharging the seed therefrom, a guide-box arranged below the seed-discharge opening and an inclined plate adapted to be moved into or from the path of the seed falling through said guide-box.

30. In a seed-sowing machine, a hopper, means for discharging the seed therefrom, a guide-box situated below the seed-discharge opening and having a slotted rear wall, and an inclined plate, R, movable through said slot into or from the path of the falling seed.

31. In a seed-sowing machine, a hopper, means for discharging the seed therefrom, a guide-box provided below the seed-discharge opening and having a slotted rear wall, a plate, R, and a holding-spring, r^3, for retaining said plate in an operative or inoperative position, substantially as specified.

32. In a seed-sowing machine, a hopper, means for discharging the seed therefrom, a guide-box below the seed-discharge opening, and inclined plate adapted to be moved into or from the path of the seed falling through said guide-box, and a second plate below and inclined in a direction opposite to the first plate said second plate forming a stationary portion of the machine and being normally out of the path of the falling seed.

33. In a seed-sowing machine, a hopper, means for discharging the seed therefrom, a guide-box, f^3, situated below the seed-discharge opening, an adjustable inclined plate, R, having on its under side a recess, r^4, and a spring, r^3, adapted to hold said adjustable plate in operative or inoperative position, substantially as specified.

34. In a seed-sowing machine, a hopper, a seed-discharge shutter therefor, a driving-wheel having an internal ring in which are formed a series of threaded openings, and removable shutter-actuating studs adapted to be screwed into said openings from either side of said ring.

35. In a seed-sowing machine, a seed-discharge-actuating mechanism comprising a driving-wheel having in a ring concentric with the periphery of the wheel a series of threaded openings extending entirely through said ring, and studs having threaded ends adapted to be screwed into said openings from either side of the ring, substantially as specified.

36. In a seed-sowing machine, a seed-discharge-actuating mechanism comprising a driving-wheel having an internal ring, m, provided with a series of threaded openings, n, and double-ended studs, m', adapted to said threaded openings, substantially as specified.

37. In a seed-sowing machine, a frame, a discharge-shutter having a fixed range of movement, a movable hopper carried in the frame, and a cam-plate pivoted to the frame and adapted to adjust the position of the hopper, substantially as specified.

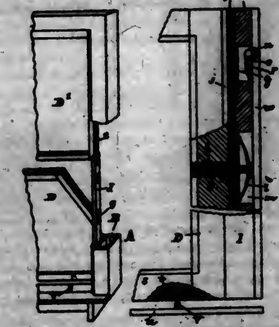
38. In a seed-sowing machine, a frame, a movable hopper carried thereby, a movable discharge-shutter at the lower end of the hopper, means for operating said shutter, and a pivoted cam plate for regulating the discharge of seed from the hopper, the obverse and reverse sides of said cam-plate being provided with different series of indicating-marks.

39. A cam-plate for regulating the discharge of seed from a seed-sowing machine, said cam-plate being reversible and having on its obverse and reverse sides indicating-marks which when moved to a predetermined position regulate the area of the discharge-opening, each side of the plate being adapted for the sowing of seeds of different classes and sizes, substantially as specified.

40. In a seed-sowing machine, a frame having at or near its rear end a finger, f^3, a hopper pivoted to the frame and provided with a yoke, o, surrounding said finger, a movable discharge-shutter at the bottom of the hopper, means for operating said shutter, a cam-plate, O, adapted to make contact with the finger, f^3, and effect the adjustment of the hopper and a screw or pin, o, forming a pivot for said cam-plate, substantially as specified.

41. In a seed-sowing machine, a two-part frame comprising forward and rear sections, a driving-wheel carried by the forward part of the frame, a hopper and seed-distributing mechanism carried by the rear part of the frame, one portion of each frame having a series of recesses arranged at different levels, and the connecting portion of the opposite section having a web or flange adapted to any one of such recesses, and a securing-bolt for connecting such sections, substantially as specified.

42. In a seed-sowing machine, a frame comprising a forward section and a rear section adjustably connected to each other, a driving-wheel carried by the forward section, a seed-hopper and distributing mechanism carried by the rear section, one of such sections being provided with a series of horizontally-arranged parallel recesses and a vertically-arranged slot and the opposite section being provided with a web or flange adapted to enter any one of such recesses and a projecting lug adapted to enter the slot of the opposite section, and a securing-bolt adapted to secure the sections together, substantially as specified.

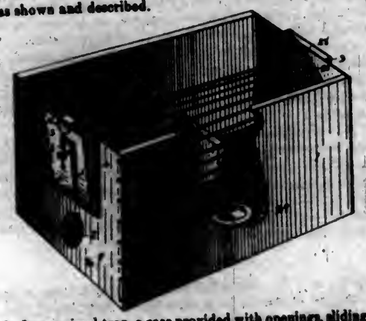


43. An adjustable connection for the two sections of an agricultural-implement frame, comprising in one section a series of recesses, l, extending in a horizontal plane and a vertical slot, l^2, extending entirely through such section, and in the opposite section a web or flange, k, adapted to any one of the recesses, l, and projecting lugs, k^2, adapted to the vertical slot, l^2, with a securing-bolt for fastening the two sections to each other, substantially as specified.

608,477. DOOR-FASTENER. HENRY B. BUTTS, St. Louis, Mo., assignor to Lucinda Butts, same place. Filed Dec. 17, 1897. Serial No. 662,202. (No model.)

Claim.—A door-securer comprising an engaging plate formed with marginal notches 12, 13, a bifurcated retaining-plate entering said notches and straddling the engaging plate, and shoulders arranged in series on the retaining-plate, whereby the device is accommodated to the clearance of the jamb, one arm of the retaining-plate terminating in the overhanging tongue 20.

608,478. REVERSIBLE WINDOW-SASH. FRANK CRANDALL, Baltimore, Md. Filed Apr. 27, 1897. Serial No. 634,373. (No model.)

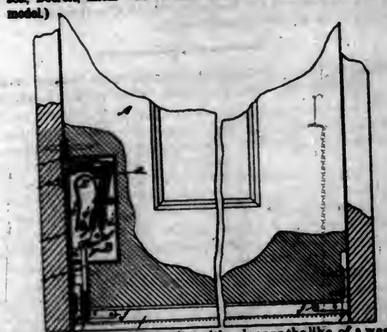


Claim.—1. In a window, the combination of the window-frame, A, having the usual guide-strips and a vertical groove, x; a sash; a vertical strip at opposite sides of the sash and sliding in said guides, the sash being pivoted to said strips, and the latter provided with a tongue, w, extending vertically—said tongue having position in the said window-frame groove; and springs on the face side of said sliding strips to traverse the window-frame, as set forth.

2. In a window, the combination of the window-frame, A, having the usual guide-strips and a vertical groove, x; a sash; a vertical strip at opposite sides of the sash and sliding in said guides, and said strips provided with a tongue extending vertically, said tongue having position in the said vertical groove; an elastic packing-strip in the joint between the sash and sliding strips; a bowed plate-spring in a recess on the outer face of the strip; and a pivot-bolt at each side connecting the sash and strip and the end of said bolt attached to said bowed spring, as set forth.

608,479. TRAP. WILLIAM T. HENRY, Oakland, Pa. Filed Apr. 8, 1897. Serial No. 631,304. (No model.)

Claim.—1. In an animal-trap, a case, a revolving cage mounted in said case carrying tripping mechanism, sliding doors carried by said case and provided with lugs engaging the tripping mechanism,

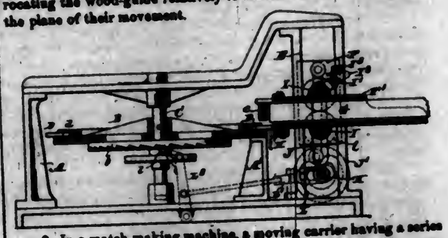


and means for closing the openings in said revolving cage, substantially as shown and described.

2. In an animal-trap, a case provided with openings, sliding doors secured to the outside of said case and provided with lugs, a revolving cage provided with openings, mounted on the inside of said case, carrying tripping means adapted to engage lugs carried by the sliding doors, sliding doors carried by the cage and adapted to close the openings, substantially as shown and described.

3. In combination, a case provided with openings, shields secured to said case, carrying sliding doors, a revolving cage, provided with openings, and carrying tripping means adapted to engage lugs carried by said sliding doors, and means for closing the openings in said cage, substantially as shown and described.

603,480. DUST AND COLD GUARD FOR DOORS. GEORGE EVERSON, Detroit, Mich. Filed June 6, 1896. Serial No. 594,602. (No model.)



Claim.—1. The combination with a door or the like, of a weather-strip rotatively mounted thereon, a pinion on said weather-strip, a rack slidably mounted in the door and meshing with said pinion, a spring-pressed bolt mounted in the door and connections between said bolt and rack whereby a movement of the bolt causes the rack to rotate said strip.

2. The combination with a door or the like provided with a groove or channel in its edge, of a weather-strip rotatively mounted in said groove or channel, a sliding bolt adapted to project from the door and engage the jamb when the door is closed, a pinion on said weather-strip, a sliding rack engaging said pinion, a spring-pressed lever against which said bolt abuts, and an operative connection between the rack and the lever, substantially as described.

3. The combination with a door or the like, of a weather-strip rotatively mounted in a groove or channel in the lower edge thereof, a pinion on said strip, a sliding bolt projecting from the door and adapted to strike the door-jamb when the door is closed, a spring-pressed lever against which the bolt abuts pivoted in a mortise or recess in the door, and provided with a bifurcated end, a bent lever F fulcrumed in said mortise and having an arm engaging in the bifurcation of said lever, a rack meshing with said pinion and connected to the other arm of said bent lever F, substantially as described.

603,481. MATCH-MAKING MACHINE. HENRY P. FENSTER, Philadelphia, Pa. Filed Mar. 24, 1897. Serial No. 628,960. (No model.)

Claim.—1. In a match-making machine, a moving carrier having a series of splint-cutters rigidly secured to the carrier, in combination with means to intermittently move the carrier always in the same direction, a wood-guide for supporting the block of wood from which the match-splints are to be cut, and power devices for reciprocating the wood-guide relatively to the cutters and transversely to the plane of their movement.

2. In a match-making machine, a moving carrier having a series of splint-cutters rigidly secured thereto, in combination with means to intermittently move the carrier, a wood-guide for supporting the block of wood from which the match-splints are to be cut, power devices for reciprocating the wood-guide relatively to the cutters and transversely to the plane of their movement, and means for applying paraffin to the splints while retained in the custody of the cutters.

3. In a match-making machine, a moving carrier having a series of splint-cutters rigidly secured thereto, in combination with means to intermittently move the carrier, a wood-guide for supporting the block of wood from which the match-splints are to be cut, power devices for reciprocating the wood-guide relatively to the cutters and transversely to the plane of their movement, and means for applying the detonating composition to the splints while rigidly held by the carriers through the agency of the cutters.

4. In a match-making machine, a moving carrier having a series of splint-cutters rigidly secured thereto, in combination with means to intermittently move the carrier, a wood-guide for supporting the block of wood from which the match-splints are to be cut, power devices for reciprocating the wood-guide relatively to the cutters and transversely to the plane of their movement, and a thrust table or anvil for sustaining the thrust of the carrier during the cutting operation of the splints.

5. In a match-making machine, a moving carrier having a series of splint-cutters rigidly secured thereto, in combination with means to intermittently move the carrier, a wood-guide for supporting the block of wood from which the match-splints are to be cut, power devices for reciprocating the wood-guide relatively to the cutters and transversely to the plane of their movement, means for applying the detonating composition to the match-splints while in the custody of the cutters, and automatic discharging devices for discharging the finished matches from the cutters.

6. In a match-making machine, the combination of a circular carrier provided about its periphery with a series of cutters, guides to support and guide the carrier whereby it may revolve, power devices for rotating it, and a transversely-reciprocating guide for the wood from which the splints are to be made.

7. In a match-making machine, the combination of a circular carrier provided about its periphery with a series of cutters, guides to support and guide the carrier whereby it may revolve, power devices for rotating it, a transversely-reciprocating guide for the wood from which the splints are to be made, and automatic devices for feeding the wood toward the cutters with each reciprocation of the guides.

8. In a match-making machine, the combination of a circular carrier provided about its periphery with a series of cutters, guides to support and guide the carrier whereby it may revolve, power devices for rotating it, a transversely-reciprocating guide for the wood from which the splints are to be made, and a stationary anvil or support under the periphery of the carrier to receive the thrust thereof when cutting the splints.

9. In a match-making machine, the combination of a circular carrier provided about its periphery with a series of cutters, guides to support and guide the carrier whereby it may revolve, power devices for rotating it, a transversely-reciprocating guide for the wood from which the splints are to be made, and means arranged near the periphery of the carrier for applying the composition to the match-splints while in the custody of the cutters.

10. In a match-making machine, the combination of a circular carrier provided about its periphery with a series of cutters, guides to support and guide the carrier whereby it may revolve, power devices for rotating it, a transversely-reciprocating guide for the wood from which the splints are to be made, means arranged near the periphery of the carrier for applying the composition to the match-splints while in the custody of the cutters, and automatic discharging devices for removing the complete matches from the cutters prior to their passing in position to receive the block from which new splints are to be made.

11. In a match-making machine, the combination of an endless series of clamps, a series of detachable cutters held by each clamp, power devices for intermittently rotating the endless series of clamps and their cutters, a reciprocating holder for the wood from which the splints are to be made, guides for the reciprocating holder for causing it to move transversely to the plane of the cutters, and power devices to reciprocate said holder in timed relation to the movement of the series of clamps whereby they operate alternately.

12. In a match-making machine, the combination of an endless series of clamps, a series of detachable cutters held by each clamp, power devices for intermittently rotating the endless series of clamps and their cutters, a reciprocating holder for the wood from which the splints are to be made, guides for the reciprocating holder for causing it to move transversely to the plane of the cutters, power devices to reciprocate said holder in timed relation to the movement of the series of clamps whereby they operate alternately, and a fixed or stationary table or anvil adapted to receive the thrust of the clamps and cutters when cutting the splints and over which the series of clamps are caused to pass.

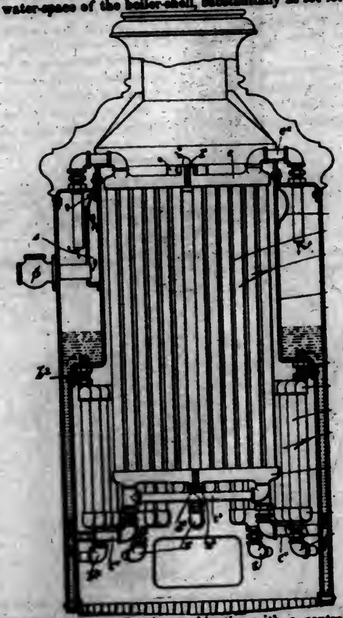
13. In a match-making machine, a rotary disk, combined with a series of independent clamping-sections arranged about the outer part of said disk, and a series of sets of cutters clamped rigidly upon the disk by said clamping-sections and extending radially outward from the periphery of the rotary disk in planes at right angles to the axis of rotation, whereby any series of cutters may be removed or adjusted without disturbing another series.

14. In a match-making machine, a rotary disk or wheel shaped carrier provided with a series of clamps adjacent to its periphery, combined with a series of separate sets of independent cutters clamped rigidly relatively to each other and upon the disk by said clamps and lying in planes at right angles to the axis of rotation.

15. In a match-machine, a rotary disk or carrier combined with a series of radially-projecting cutters extending outward from its periphery, a stationary support in planes at right angles to the axis of rotation, and ball-bearings between the said support and disk adjacent to the cutters to directly receive the thrust.

16. In a match-making machine, a circular carrier combined with a series of projecting cutters about its periphery, a stationary support, ball-bearings between the said support and carrier, a circular guide for guiding the carrier in a circle, and a transversely-movable wood-guide for moving the wood across the plane of the cutters.

17. In a match-making machine, the combination of a movable carrier provided with a series of sets of cutters adapted to be brought into cutting position successively, power devices for moving the carrier and its cutters intermittently in the same direction to bring the series of sets of cutters successively before a wood-guide, a reciprocating wood-guide movable transversely to the line of travel of the cutters, power devices to reciprocate the wood-guide so as to move the wood held thereby over the cutters of a set when held stationary, and connecting devices between the devices for moving the carrier and the power devices for reciprocating the wood-guide whereby the cutters are held stationary while the wood-guide is moved transversely to cause the wood to pass over the cutters, and when the wood-guide is moved out of cutting position the carriers and cutters are moved to bring the next set of cutters into operative cutting position.



603,482. STEAM-BOILER. CHARLES H. FOX, Cincinnati, Ohio. Filed Oct. 11, 1897. Serial No. 654,757. (No model.)

Claim.—1. In a steam-boiler of the character indicated in combination with the steam and water jacketed shell a system of vertical detachable manifolds with headers arranged within the shell, consisting of two independent sets or series each manifold having connection to the steam-space of the shell at the top, and a connection below to the water-space of the boiler, substantially as set forth.

2. In a steam-boiler of the character indicated, two series of manifolds with headers arranged end to end, in combination with the fixed top supporting-bar to space and support the system and the independent steam connections extending outward in opposite directions radially as ties to hold the system rigid in relation to the shell, substantially as set forth.

3. In a steam-boiler of the character indicated two series of manifolds with headers arranged end to end, and supported by a top brace, in combination with a spacing-bar interposed between the series at the lower end, and water connections arranged to tie each two opposite manifolds to the spacing-bar and a single extension to the water-leg as a tie-brace for both and a common communication to the water-space of the boiler-shell, said extensions being carried to opposite sides of the water-leg, alternately in series, substantially as set forth.

4. In a steam-boiler of the character indicated two series of manifolds with headers arranged end to end and supported by a top brace, in combination with a spacing-bar interposed between the series at the lower end, and water connections arranged to tie each two opposite manifolds to the spacing-bar and a single extension to the water-leg as a tie-brace for both and a common communication to the water-space of the boiler-shell, substantially as set forth.

5. In a steam-boiler, in combination with a central and supported system of manifolds of the character indicated, the combination of a spacing-bar provided with projections engaging perforated lugs of the lower headers, tie connections, c^2, extending across to secure opposite manifolds to the spacing-bar, and connections, c^4, extending in various radii to opposite sides of the water-leg, to secure the system to the shell against displacement in any direction, substantially as set forth.

6. In a steam-boiler of the character indicated, a concaved strip of metal arranged as shown at the top of the inner shell forming a conduit adjacent to the shell, said conduit being provided with a number of relatively minute receiving-orifices at the otherwise closed receiving end, and terminating at the discharge end in the steam-supply exit, substantially as set forth.

603,488. FILTERING PLANT FOR WATER-WORKS. TOBEY C. HEWES, Muncie, Ind., assignor of one-half to Charles H. Raney, same place. Filed July 19, 1897. Serial No. 645,120. (No model.)

Claim.—1. In a water-filtering plant, a filtering-basin having an inlet and outlet, one or more layers of filtering material placed therein, and porous pipes arranged on the bottom of the filter connected with the outlet.

2. A water-filtering plant consisting of filtering-basins connected to and communicating with each other, each bed having one or more layers of filtering material placed in them, the bottom of each basin being covered with rows of soft drain-tile, as and for the purpose set forth.

3. A water-filtering plant having stationary and portable flush-pipes connected and arranged in the filter-beds and a sewer or drain tile arranged and connected by a valve to form an outlet or drain for the said filter-beds, as and for the purpose set forth.

4. A water-filtering plant having two or more filtering-basins, the said basins connected together by pipes, steam admitted in the said pipes for heating the water as it passes through from one filter-bed to another, all as and for the purpose set forth.

5. A water-filtering plant having two or more filtering-basins the said basins being connected together by pipes, and means for heating the water in the pipes as it passes from one basin to another.

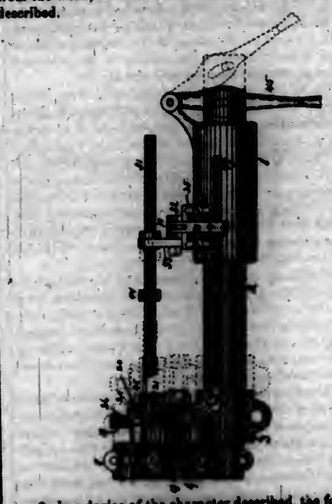
6. In a water-filtering plant having two or more filtering-basins, the said basins being connected together by pipes, an elbow in the pipes, and a perforated steam-pipe in the connecting-pipes.

7. A water-filtering plant having a filtering-basin, flush-pipes arranged in the basin, a drain-pipe leading from the bottom of the basin, a valve for controlling the drain-pipe provided with a stem leading

to the outside of the basin and a screen surrounding and protecting the valve.

8. A water-filtering plant having a series of filtering-basins arranged on different planes, a drain-pipe leading from the lower portions of the basins, a vat beneath the basin into which the drain-pipe leads, a pump arranged in the vat, and connecting means extending to the outside of the basin for operating the pump.

9. A water-filtering plant having a filtering basin, an arch arranged at the rear end of the basin and provided with a manhole and porous pipes arranged in the basin having one of their ends leading into the arch.



10. In a filtering plant, the combination with a filtering-basin, a second filtering-basin arranged on a lower horizontal plane than the first basin, a settling-basin arranged on a lower horizontal plane than the first basin and interposed between the two filtering-basins, and a pipe leading from the bottom of the first filtering-basin to a point adjacent the bottom of the settling-basin.

11. In a filtering plant, the combination with a filtering-basin, a second filtering-basin arranged on a lower horizontal plane than the first basin, a clear-water basin arranged on a lower horizontal plane than the second filtering-basin, a settling-basin interposed between the two filtering-basins and on a horizontal plane lower than the first filtering-basin, a pipe leading from the bottom of the filtering-basin to a point adjacent the bottom of the settling-basin, a settling-basin interposed between the second filtering-basin and the clear-water basin and on a horizontal plane lower than the said filtering-basin and a pipe leading from the bottom of the said filtering-basin to a point adjacent the bottom of the settling-basin.

608,484. AUTOMATIC TURRET-HEAD FOR LATHES. ANDREW J. JOHNSON, Cleveland, Ohio, assignor of one-half to Walter Kennard, same place. Filed May 10, 1897. Renewed Feb. 21, 1898. Serial No. 671,300. (No model.)

Claim.—1. The combination, with the tail stock and spindle of a lathe, of a bracket secured to said tail-stock, a spring-jaw upon said bracket, a puppet-head upon said spindle carrying a rotatable turret-head, a register-pin slidingly engaging said puppet and turret heads, a spring-actuated lever engaging said register-pin, and an actuating-rod connected to said lever and slidingly engaging said spring-jaw upon said bracket, in the manner and for the purpose, substantially as described.

2. The combination, with the tail stock and spindle of a lathe, of a bracket upon said tail-stock, an adjustable arm upon said bracket, a puppet and turret head removably secured to said spindle, a rigid bevel-gear upon said turret-head engaging with a rotatable gear in said puppet-head, a ratchet, a spring-actuated lever and pawl, and an actuating-rod secured to said lever and slidingly engaging said arm upon the bracket, and provided with a stop-collar, as a means for partially turning said turret-head, automatically, as it is retracted from the work, in the manner and for the purpose substantially as described.

3. In a device of the character described, the following elements in combination: a puppet-head 3, adapted to be secured to the tail-spindle 2, a turret-head 4, rotatably secured to the face of said puppet-head, a register-pin 13, slidingly engaging said puppet and turret heads, a lever 12, fulcrumed to said puppet-head, one end of said lever engaging the register-pin 13, and actuating-rod 17, connected to the opposite end of said lever 12, and a proper stop upon the tail-stock for compelling the withdrawal of said register-pin from said turret-head as the latter is retracted from the work, in the manner and for the purpose, substantially as set forth.

4. In a device of the character described, the following elements in combination: a puppet-head 3, adapted to be secured to the tail-spindle 2, of a lathe, a turret-head 4, rotatably secured to the face of said puppet-head, and provided with a series of tool-sockets 8, a rigid bevel-gear 10, in the inner face of said turret-head, a rotatable bevel-gear 21, in the puppet-head engaging said gear 10, a ratchet 22 upon the gear 21, a spring-actuated lever 23, having a pawl 27 engaging said ratchet, an actuating-rod 31, one end of which is connected to said lever, a stop-collar 44 upon said rod 31, the opposite end of said rod slidingly engaging a suitable bracket-arm 33, upon the tail-stock, in the manner and for the purpose, substantially as specified.

608,485. DEVICE FOR TESTING METERS. FRANK LAMBERT, Brooklyn, N. Y., assignor of one-half to Joseph W. Kay, same place. Filed Apr. 14, 1896. Serial No. 587,569. (No model.)

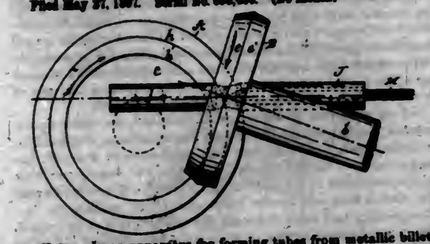
Claim.—1. In a fluid-meter having a nutating-disk valve a spindle therefor, and a valve-chamber, a record-surface supported in proximity to said spindle end and adapted to be marked by said spindle during the nutation of said valve to record the various angles of nutation, substantially as described.

2. In a fluid-meter having a nutating-disk valve a spindle therefor, and a valve-chamber, a record-surface supported in proximity to said spindle end and adapted to be marked by said spindle during the nutation of said valve and means for adjusting said spindle in said valve with reference to said record-surface, whereby the various angles of nutation of the disk are recorded, substantially as described.

3. In a fluid-meter having a nutating-disk valve, a spindle therefor, and a valve-chamber, a record-surface supported in proximity to said spindle end and adapted to be marked by said spindle during the nutation of said valve and means for adjusting said spindle in said valve with reference to said record-surface, whereby the various angles of nutation of the disk are recorded, substantially as described.

4. In a fluid-meter having a nutating-disk valve, a spindle therefor, and a valve-chamber, a record-surface supported in proximity to said spindle end and adapted to be marked by said spindle during the nutation of said valve and means for adjusting said record-surface with reference to said spindle, whereby the various angles of nutation of the disk are recorded, substantially as described.

4. In a fluid-meter having a nutating-disk valve, a spindle therefor, a valve-chamber and an inclosing casing, a record-surface supported within said casing and in proximity to said valve-spindle and adapted to be marked by said spindle to record the various angles during the nutation of said valve, substantially as described.



5. In a fluid-meter having a nutating-disk valve, a spindle therefor, and a valve-chamber, a record-surface supported in a plane at right angles to the axis of the valve chamber and also in proximity to said valve-spindle and adapted to be marked by said spindle to record the various angles during the nutation of said valve substantially as described.

6. In a fluid-meter having a nutating-disk valve, a spindle therefor and a valve-chamber, a record-plate supported in a plane at right angles to the axis of the valve-chamber, and means acting upon said record-plate to hold it in contact with the extremity of said spindle, substantially as specified.

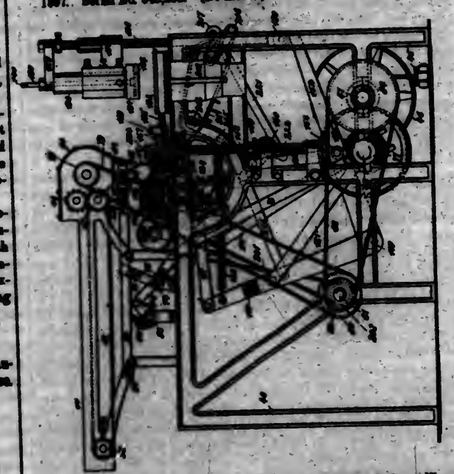
7. In a fluid-meter having a nutating-disk valve, a spindle therefor and a valve-chamber, a record-plate supported in a plane at right angles to the axis of the valve-chamber and a spring acting upon said record-plate to hold it in contact with the extremity of said spindle whereby the various angles of nutation of the disk are recorded, substantially as described.

8. In a fluid-meter having a nutating-disk valve, a spindle therefor and a valve-chamber, a concave record-plate—said concavity conforming to the path of said spindle end in nutating supported with its periphery in a plane at right angles to the axis of the valve-chamber and with its center in line with said axis, and disposed in proximity to said spindle end so as to be marked by said spindle during the nutation of the valve, substantially as described.

608,486. TUBE-MAKING MACHINE. JOHN B. MOZINGO, Auburn, Pa., assignor to the Auburn Bolt and Nut Works, same place. Filed May 27, 1897. Serial No. 638,401. (No model.)

Claim.—In an apparatus for forming tubes from metallic billets or blanks, two disks, rotating shafts carrying said disks, said shafts located with reference to each other in such a position that the vertical planes of their axial lines are at right angles, the axial line of one of said shafts being also arranged in a horizontal plane, the axial line of the other shaft being inclined to the horizontal, said disks adapted to embrace a billet between their working faces, and a mandrel arranged on the axial line of said billet, substantially as and for the purpose set forth.

608,487. WATER-PIPE OR HOSE NOZZLE. EDWARD G. CHESWELL, Bennington, Vt. Filed May 14, 1897. Serial No. 636,465. (No model.)



Claim.—1. A hose-nozzle A with its exterior screw-thread *b c*; a screw-nut L turning thereover, a yoke C, a stream-spreading device D secured thereto and a collar to which the yoke is pivoted, combined and constructed to operate substantially as specified.

2. In combination, a pipe or nozzle, a stream-spreading device, a yoke formed with pieces *e*, *f*, a divided collar H having its portions secured together and to which the yoke is pivoted, constructed and arranged to operate as described.

3. In combination with a pipe or nozzle, a stream-spreading device, a yoke to which it is secured, a collar surrounding the pipe or nozzle and to which the yoke is pivoted, and a means for holding the yoke when adjusted relatively with the collar, substantially as set forth.

608,488. CIGARETTE-MAKING MACHINE. JULIUS H. SCHMIDT, Bayonne, N. J., assignor to John C. Eyer, same place. Filed July 20, 1897. Serial No. 645,292. (No model.)

Claim.—1. In a machine of the character described, the rolling-apron, the pressure-roller therefor, mechanism for feeding the filler-tobacco, the charge-box for conveying the charges of filler-tobacco from said feeding mechanism to said rolling-apron, and means for moving said charge-box between said feeding mechanism and said apron, said charge-box having the converging sides one of which constitutes the door 98, combined with the shaft 99 carrying said door, the crank-arm 102 on said shaft, the spring 100 flexed against said door, the cam 105 for acting upon said crank-arm 102 to open said door when said charge-box is arriving at its lower position, means for maintaining said door in its open position during the ascent of said charge-box, and means for closing said door when said charge-box is arriving at its upper position; substantially as set forth.

2. In a machine of the character described, the rolling-apron, the pressure-roller therefor, mechanism for feeding the filler-tobacco, the charge-box adapted to move between said feeding mechanism and said apron to deliver the charges of filler-tobacco to the latter, and means for effecting the movement of said charge-box between said feeding mechanism and said apron, said charge-box having the door 98, shaft 99 carrying said door, the spring 100 flexed against said door, the notched plate 106 on said shaft, the spring 107 engaging said notched plate, and the crank-arm 102 on said shaft, combined with the cam 105 to engage said crank-arm 102 when the charge-box is in its lower position, and the stationary arm 101 to engage said crank-arm when said charge-box is in its upper position; substantially as set forth.

3. In a machine of the character described, the rolling-apron, the pressure-roller therefor, mechanism for feeding the filler-tobacco, and the charge-box for conveying the charges of filler-tobacco from said feeding mechanism to said rolling mechanism, said charge-box having downwardly-converging sides, one of which constitutes a door, combined with the arm 90 carrying said charge-box and pivotally secured at its rear end, the rock-shaft 93 below said arm 90, the cam 92 carried on said rock-shaft and upon which said arm 90 rests, and means intermediate said rock-shaft 93 and the driving-shaft for actuating said cam 92 to raise and lower said arm 90 with the charge-box carried thereby; substantially as set forth.

4. In a machine of the character described, the rolling-apron, the pressure-roller therefor, and feed mechanism for feeding the filler-tobacco, said mechanism comprising the endless feed-belt mounted

upon rollers, the pressure-roller 61, the revoluble picker-roller 62, the hood 63 covering said rollers 61 and 62, and the chute 64 extending downward from said hood, combined with the charge-box adapted to receive the filler-tobacco from said chute and deliver the same to said rolling-apron and provided with a hinged door, the longitudinal arm 90 extending below the feed-belt for filler-tobacco and pivoted at its rear end, the transverse rock-shaft 93 below said arm 90, the cam 92 secured upon said rock-shaft and directly receiving said arm 90, the crank-arm 94 on said rock-shaft and means intermediate said crank-arm 94 and the driving-shaft for operating said rock-shaft and said cam to effect the movement of the arm 90 and said charge-box; substantially as set forth.

5. In a machine of the character described, the rolling-apron, the pressure-roller therefor, mechanism for feeding the filler-tobacco, the charge-box for conveying the charges of filler-tobacco from said feeding mechanism to said rolling-apron, and means for moving said charge-box between said feeding mechanism and said apron, said charge-box having the converging sides, one of which constitutes the door 98 and the other of which is provided with the downwardly-projecting flange 97 to form the pocket in said rolling-apron, combined with the spring acting to hold said door closed, means for opening said door when said charge-box is arriving at its lower position, means for retaining said door open during the ascent of said charge-box, and means for closing said door when said charge-box is arriving at its upper position: substantially as set forth.

6. In a machine of the character described, the rolling-apron, the bed 104 for said apron, the rod 110 located in the rear of said bed 104 and over which the said apron passes, side frames 114 at opposite sides of said bed 104, the slides 115 moving along said side frames 114, the pressure-roller 112 carried by said slides 115 and means for moving said slides from the driving-shaft, said slides first moving to close the pocket or loop in the rolling-apron, then temporarily stopping and then resuming their forward movement to roll the cigarette, combined with means connected with said apron for drawing the pocket or loop therein down to size after said pressure-roller has closed said pocket or loop and temporarily ceased to move, the wrapper-carrier adapted to receive the cut wrapper, means for moving said carrier inward to the forward edge of the pocket in said rolling-apron, means for turning said carrier to project the lower inner edge of the wrapper into the forward edge of the pocket in the rolling-apron prior to the closing of said pocket by said pressure-roller, the charge-box for feeding the charges of filler-tobacco to said apron, and means operated from the driving-shaft for moving said charge-box and causing the latter to descend into the space between the said rolling-bed 104 and rod or shaft 110 to form the pocket or loop in said apron; substantially as set forth.

7. In a machine of the character described, the driving-shaft, the punch operable therefrom, the platen within said punch, means for driving said platen downward below said punch when the latter has cut the wrapper and is at its lowest position for the purpose of delivering said wrapper in smooth condition upon the wrapper-carrier, and the open die receiving the leaf and coöperating with said punch in the cutting of the wrapper, combined with the wrapper-carrier, the rolling mechanism, means for maintaining said carrier below said open die and at a suitable elevation to receive the cut wrapper when driven downward by said platen, and means for moving said carrier from below said open die to the rolling-apron to deliver the cut wrapper to said apron; substantially as set forth.

8. In a machine of the character described, the driving-shaft, the punch operable therefrom, the platen within said punch, means for driving said platen downward below said punch when the latter has cut the wrapper and is at its lowest position for the purpose of delivering said cut wrapper in smooth condition upon the wrapper-carrier, and the open die receiving the leaf and coöperating with said punch in the cutting of the wrapper, combined with the rolling mechanism, the wrapper-carrier movable from said die to the rolling-apron for conveying the cut wrappers to said apron, means for moving said carrier, and means for tilting the carrier for projecting the edge of the wrapper overhanging said carrier into the pocket of said apron; substantially as set forth.

9 In a machine of the character described, the rolling-apron, the pressure-roller therefor and means connected with said apron for drawing the pocket or loop therein down to proper size, combined with the wrapper-carrier, the clips at the opposite ends of said carrier for holding the wrapper thereon, means for operating said clips, means for moving said carrier inward to the upward forward edge of the pocket or loop in said apron, and means actuated by the rolling mechanism for tilting the carrier for projecting the overhanging edge of said wrapper into said pocket during the movement of said pressure-roller to close said pocket; substantially as set forth.

10. In a machine of the character described, the rolling-apron, the pressure-roller therefor, means connected with the end of said apron for drawing the pocket or loop therein down to size, and means for operating said pressure-roller from the driving-shaft, combined with the oscillating wrapper-carrier arm 156, the wrapper-carrier 136 upon said arm, the clips at the opposite ends of said carrier 136 for holding the wrapper, the shafts 185 and 186 carrying said clips, the plates 188 and 190 carried by said shafts, the rod 191 connecting said plates, the spring 192 maintaining said clips in their closed position, the cam 193 for opening said clips to receive the wrapper, and means for moving said wrapper-carrier inward to deliver the wrapper to said rolling-apron; substantially as set forth.

11. In a machine of the character described, the rolling-apron, the pressure-roller therefor and means for actuating said roller from the driving-shaft, combined with the horizontally-oscillating wrapper-carrier arm 156, the wrapper-carrier 136 on said arm, the sleeve 157 in which said arm is loosely mounted, the roller 167 on said arm, the cam 166 engaging said roller, the roller 170 also on said arm, the tramway 171 receiving said roller 170 whereby the carrier is inclined, and means for actuating said sleeve 157 to oscillate said arm 156 and carrier 136; substantially as set forth.

12. In a machine of the character described, the rolling-apron, the pressure-roller therefor, and means for operating said roller from the driving-shaft, combined with the wrapper-carrier arm 156, the wrapper-carrier 136 on said arm, the sleeve 157 receiving said arm, means for causing said arm to move inward to deliver the wrapper to the rolling-apron, and means for turning said arm within said sleeve in order to incline said carrier 136 and project the lower edge of the cut wrapper into the pocket of the rolling-apron; substantially as set forth.

13. In a machine of the character described, the rolling-apron, the pressure-roller therefor, and means for actuating said roller from the driving-shaft to roll the cigarette in the apron, combined with the wrapper-carrier arm 156, the wrapper-carrier 136 on said arm, means for oscillating said arm to move said carrier 136 inward to the pocket of the rolling-apron, and means for then turning said arm 156 axially and projecting the lower edge of the cut wrapper into said pocket; substantially as set forth.

14. In a machine of the character described, the rolling-apron 103, the pressure-roller therefor and means for actuating said pressure-roller from the driving-shaft, combined with the wrapper-carrier arm 156, the wrapper-carrier 136 on said arm, the sleeve 157 loosely receiving said arm, means connected with said sleeve for moving said arm and said carrier 136 inward to the rolling-apron, means for maintaining said wrapper-carrier in an inclined position during its inward travel to the pocket of the rolling-apron and means for imparting an axial motion to said arm 156 when the carrier 136 is at the forward edge of the pocket in said apron and thereby projecting the edge of the wrapper into said pocket; substantially as set forth.

15. In a machine of the character described, the rolling-apron, the pressure-roller therefor, and means for actuating said roller from the driving-shaft, combined with the wrapper-carrier arm 156, the wrapper-carrier 136 on said arm, the sleeve 157 loosely receiving said arm, the roller 170 on said arm, the tramway 171 over which said roller travels with said carrier 136 in an inclined position, the bar 173 supporting said roller 170 when the carrier 136 is at its inward position and means for removing the support from said bar 173 when said carrier is over the forward portion of the pocket in the rolling-apron and it is desired to close said pocket; substantially as set forth.

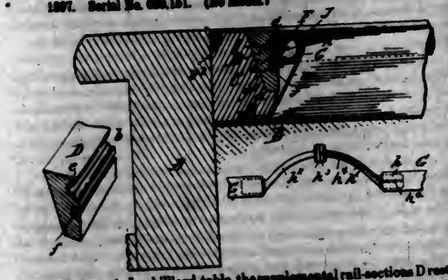
16. In a machine of the character described, the rolling-apron, the pressure-roller therefor, the slides 115 carrying said roller, the support 175 carried by one of said slides, and means for operating said slides from the driving-shaft, combined with the oscillating arm 156, the wrapper-carrier 136 on said arm, the sleeve 157 in which said arm is loosely mounted, means for oscillating said sleeve to effect the movement of said arm 156 and carrier 136 to the apron, the roller 170 on said arm 156, the tramway 171 supporting said arm 170, the bar 173 receiving said roller 170 after the latter leaves said tramway 171, and the stop 176 for said bar 173 when the latter is relieved of its support 175 by the inward motion of said pressure-roller; substantially as set forth.

17. In a machine of the character described, the rolling-apron, the pressure-roller therefor, and means for actuating said roller from the driving-shaft, combined with the horizontally-oscillating arm 156, means for horizontally oscillating said arm 156, the wrapper-carrier 136 on said arm, means for maintaining said carrier 136 in a horizontal position when said carrier is at its outward position, means for inclining said carrier 136 during its inward travel to the rolling-apron, and means for projecting said carrier downward to deliver the overhanging edge of the wrapper into the pocket of the rolling-apron when said carrier is at its extreme inward position; substantially as set forth.

18. In a machine of the character described, the punch for cutting the wrappers and operable from the driving-shaft, the die below said punch, the wrapper-carrier below said die to receive the cut wrappers, the clips at the ends of said carrier, means for maintaining said clips in an open position when the carrier is below said die, and means for closing said clips upon the opposite ends of the wrapper when said carrier leaves said die, combined with the rolling-apron, the pressure-roller therefor, means for reciprocating said roller, and means for moving said carrier from the die to the pocket of the rolling-apron in order to deliver the cut wrapper to the latter; substantially as set forth.

19. In a machine of the character described, the punch for cutting the wrappers and operable from the driving-shaft, the platen within said punch, the rod supporting said platen and extending upward through the plunger-rod of said punch, the pivoted lever connected to the upper end of the platen-rod, the spring imparting an upward tension to said platen-rod, the support for said lever connected with the punch-rod, the stop to engage the outer end of said lever upon the descent of the punch for the purpose of driving the platen below the punch, and the die below said punch, combined with the rolling-apron, the pressure-roller therefor, the wrapper-carrier adapted to travel from said die to said apron to deliver the cut wrappers to the latter, and means for moving said carrier; substantially as set forth.

20. In a machine of the character described, the punch for cutting the wrappers and operable from the driving-shaft, and the open die below said punch and through which the cut wrappers are driven, combined with the rolling-apron, the reciprocating roller therefor, the wrapper-carrier adapted to convey the cut wrappers from said die to said apron, and means for moving said carrier from said die to said apron, said means arresting said carrier on its inward movement at the front edge of the pocket in the rolling-apron and on its outward movement in a position with respect to said die to permit one edge of the wrapper to overhang the edge of said carrier; substantially as set forth.



21. In a machine of the character described, the rolling-apron, the reciprocating roller therefor, means for reciprocating said roller, the wrapper-carrier adapted to convey the cut wrappers inward to said rolling-apron, and means for actuating said carrier, combined with the passing-brush, and the shaft upon which said brush is mounted and which is pivotally secured at one end, combined with the gear-wheel on said shaft, the vertical rod having teeth to engage said gear-wheel when said brush is at its inward position over the rolling-apron, and means for moving said rod against said gear-wheel for the purpose of revolving said brush while at its inward position; substantially as set forth.

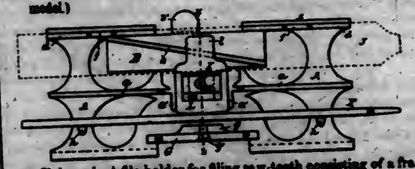
603,489. MILK-CAN LOCK. JOHN G. STAUDENMAYER, Allegheny, Pa. Filed Jan. 27, 1897. Serial No. 620,949. (No model.)

Claim.—In a lock of the character described, a plate secured within the lid of the can, a lock-bar secured to said plate, an operating-plate, a slotted sleeve provided with an angular head, said angular head held normally out of engagement with the operating-plate by the spring b^5, the slotted sleeve to be engaged by the key to draw the angular head into engagement with the operating-plate, and turn the same to release the bars g and g'; substantially as shown and described.

603,490. PNEUMATIC CUSHION FOR BILLIARD OR POOL TABLES. WILLIAM P. STEBBINS, Springfield, Mass. Filed Mar. 29, 1897. Serial No. 630,151. (No model.)

Claim.—1. In a billiard-table, the supplemental rail-sections D resting on the rails C, each set of said rails on the four sides of the table having squared ends, which ends abut each other only on their inner edges at each of the corners of the table, whereby a recess or pocket is formed at each of said corners, combined with the inflatable tubes which rest upon the rails D, and suitable couplings for connecting the ends of the tubes, the couplings being located in the pocket or recesses formed between the ends of the rails, substantially as shown.

2. The combination with the rail C of a billiard-table having the seat *a*, of the supplemental rail-section D fitted in said seat, and having the longitudinal groove *e f* in its forward edge, the rubber tube seated against the supplemental rail-section D, and a strip of textile material overlying said tube and having its edge portions confined in said grooves, and having secured, as one thereto, the triangular strip J of elastic rubber, and the outer cushion-covering cloth, substantially as described.



3. In a billiard-table the combination with the main rail C having the recess or depression in its inner upper corner whereby the stepped seat is formed of the supplemental rail D fitted in said seat, and having on its inner face the rest *b*, the inflatable tube G, the textile binder-strip J having connected on its front face the triangular section J of elastic rubber, said binder-strip having its edge portions confined to said supplemental rail, substantially as and for the purpose set forth.

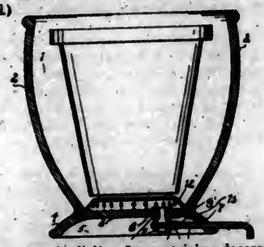
4. In a billiard-table, the main rails C, C having seats formed along their upper and inner edges, and the supplemental rail-sections D fitted within said seats, said rails and rail-sections having square ends and said ends meeting only at their inner corners, thereby forming pockets O at the corners of the table, combined with the inflatable tubes confined along their front edges, and the rails and couplings for the adjacent tubes, the couplings being located within the pockets, substantially as shown.

5. In a billiard or pool table, the combination with rails of inflatable cushion-tubes confined along the front of the rails, and several thereof having at their ends tubular stems, end-flanged and facewise abutted, the separate wire bars *n* having the ring-eyes n^3 encircling the stems behind their end-flanges, and having the angularly-turned members n^2 endwise abutted, and the slide-ring *o* adapted, being moved on said bars toward the ring-eyes to contract the latter against the coupling-flanges, substantially as described.

6. In a billiard or pool table, the combination with rails, of inflatable cushion-tubes confined along the front thereof, one of said tubes having its end closed and another having a valved passage therethrough and several of the tubes having at their ends, the tubular stems, end-flanged and facewise abutted, the separate wire bars *n* having the ring-eyes n^3 respectively encircling the stems behind their end flanges, and having the angularly-turned members n^2 endwise abutted, the sleeve *f* inclosing said members *n* and the slide-ring *o*, all arranged substantially as and for the purposes explained.

603,491. COMBINATION SAW-TOOL. HERMAN L. TREMLOOD, Indianapolis, Ind. Filed Sept. 13, 1897. Serial No. 651,420. (No model.)

Claim.—1. A file-holder for filing saw-teeth consisting of a frame having ribs, flanges and dowels for the file to rest against, all made integral therewith, a sliding jaw, a guide and means to secure said jaw, a diagonally-ribbed locking-bolt having a suitable finger projection and mounted on said holder and engaging with said jaw to secure a file placed in a vertical position when moved in one direction and to hold a file in a flat position when moved in the opposite direction, in combination with a bracket secured and inserted in the holder, said bracket having a suitable slit and with the filing-surface of the same placed slightly below the inner edge of the flange of the holder and adjacent thereto for the purpose of filing the drag-teeth of saws, substantially as shown and described



2. In a combination saw-tool, the frame A having the flanges *c c* and *i i*, the ribs *a a*, the dowels *h h* and the bracket G set into a recess of the frame at the edge opposite said flanges *c c*, the base *a'* at the central front of said frame, the rectangular pillar x' on said base, the vise-jaw L working on said base and provided with the shoulders P P and groove *l*, and the locking-bolt B adapted to actuate said jaw, substantially as shown and described.

3. In a jointing file-holder, the combination with the frame having the flanges *c c* and rests *f f*, of the base *a'* and the pillar x' thereon, the vise-jaw L working on said base and provided with the shoulders P P and groove *l*, the locking-bolt B provided with the diagonal

rib *b* engaging said groove, and the dowels A situated as shown, substantially as shown and described.

4. In a tool-holder, the combination with the frame, having the flanges *e* and the ribs *a a* thereon, of the base *d'* and rectangular pillar *n'* thereon, the vise-jaw L on said base and provided with the shoulders P P and groove *l*, the locking-bolt B adapted to actuate said jaw, and the bracket G having the slit g^2 and flanges *i* forming a tooth-gage, substantially as shown and described.

603,492. JARDINIÈRE. HOSEA WATERS, Philadelphia, Pa. Filed Mar. 29, 1897. Renewed Jan. 20, 1898. Serial No. 667,357. (No model.)

Claim.—1. In a jardinière for containing decorative plants in pots, a vessel having a chamber 1, a bottom 3, and a chamber 5, inclosed by a rim 4, having an opening therein, adjacent to an opening 6, in the bottom, in combination with a faucet inserted in the opening 6, and a tube adapted to enter the opening 7, and act as a key to said faucet, substantially as set forth.

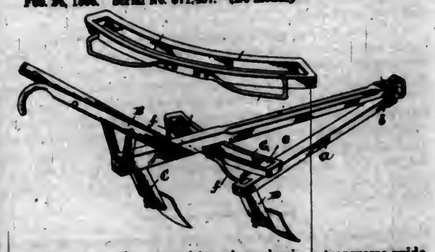
2. In a jardinère a flat-bottomed chamber, having an opening in the bottom adjacent to one side, a lower supporting-rim inclosing a bottom chamber with a perforation in said rim adjacent to said opening, and a faucet inserted in the bottom opening in combination with a ductile metallic stand provided with a rim resting on or near the circumference of the bottom for the purpose of supporting the flower-pot and protecting the jardinère from shock and breakage as set forth.

3. In a jardinière a flat-bottomed chamber having an opening therein adjacent to one side in combination with a faucet having a vertical receiving branch, and a downwardly-inclined discharge branch, through the plug, with a discharge-tube fitting detachably the inclined discharge branch, and provided with pins and notches arranged to turn the plug by means of the discharge-tube as set forth.

603,493. REGISTER FOR POCKET-BOOKS. SAMUEL L. WHITE, Philadelphia, Pa. Filed Apr. 16, 1897. Serial No. 632,496. (No model.)

Claim.—A pocket-book registering device comprising a metallic disk-containing pocket open at one edge only and having flat face-plates *b*, *b'*, provided with rounded ends, the lower of said face-plates being provided at its opposite ends with integral fingers *d*, forming spring-clamps adapted to partly embrace the edge of the flap of the pocket-book, a series of headed pins *p*, extending across the pocket and arranged to slightly draw the face-plates *b*, *b'*, toward each other, and a series of overlapping disks, *c*, c', c^2, c^3, bearing on their faces numerals from "0" to "9," said disks being mounted centrally upon the pins, *p*, and having their edges slightly protruding beyond the mouth of the pocket, substantially as specified.

603,494. WRENCH. FRANK AARON and JAMES R. G. HUFFMAN, Lansing, Kans. Filed Sept. 28, 1897. Serial No. 652,564. (No model.)



Claim.—1. A wrench consisting of the member carrying one jaw and having teeth upon its upper side, the member carrying the other jaw and having a lever secured in the body portion thereof, and carrying a toothed portion to engage the teeth on the other member to hold the jaws in a more rigid position, and a locking-lever pivotally secured to the handle end of the first-mentioned member adapted to engage teeth on the lower side of the last-mentioned member to rigidly hold the jaws of the wrench in place.

2. In a wrench, the combination with a fixed jaw, its shank and handle, of a toothed dog carried by the shank, and a pivoted dog-actuating lever, a movable jaw, a shank extending therefrom provided with a series of teeth designed to cooperate with the dog, and a pivoted locking-handle upon the lower extremity of the movable shank and provided with an eccentric toothed face designed to co-operate with teeth upon the fixed shank, said teeth being disposed oppositely upon the movable shank, substantially as specified.

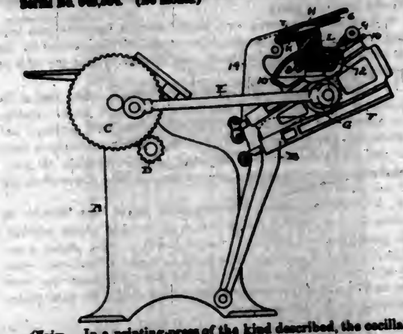
3. The combination with a fixed head, of a shank, and handle extending therefrom and provided with a longitudinal recess, of a fixed jaw, a shank extending therefrom and movable within the recess in the fixed shank, oppositely-disposed teeth upon the contiguous faces of the two shanks but out of coincidence, a toothed dog movable within a recess in the fixed shank and designed to engage the teeth upon the movable shank, a dog-actuating lever pivotally connected to the dog, and a pivoted locking-handle at the lower extremity of the movable shank provided with an eccentric toothed locking face designed to engage the teeth upon the fixed shank, substantially as specified.

603,495. PLOW. WILLIAM ARNER, Shelbyville, Ky. Filed Feb. 24, 1898. Serial No. 671,687. (No model.)

Claim.—1. A plow comprising a beam having a transverse guideway, a plow-stock supported by the guideway and movable thereupon from side to side, and means for holding the stock upon the plate at opposite sides of the beam, substantially as described.

2. A plow comprising a main beam, an auxiliary beam pivoted at its forward end to the main beam and carrying a plow-stock at its rear end, a transverse way carried by one of the beams, and one of the beams provided with a member moving in the said way, substantially as described.

3. A plow comprising a main beam, an auxiliary beam situated below the main beam and pivoted at its front end thereto, the auxiliary beam carrying at its rear end a plow-stock, a way carried by one of the beams for supporting the auxiliary beam, and means for holding the auxiliary beam in its reversed or opposite position, substantially as described.



4. A plow comprising a main beam, an auxiliary beam situated therebelow having its outer end pivotally connected to the main beam, the free end of the auxiliary beam carrying a plow-stock, the auxiliary beam being free to move automatically from side to side, and means for locking the auxiliary beam in its opposite or reversed position respecting the main beam, substantially as described.

5. A plow comprising a main beam, an auxiliary beam therebelow and pivoted at its front end to the main beam, the free end of the auxiliary beam carrying a plow-stock, the main beam having secured thereto at its under side a guide-plate, and the auxiliary beam having a stud projecting within the guideway, substantially as described.

6. A plow comprising a main beam, an auxiliary beam pivoted at its forward end to the main beam and situated therebelow, a slotted guideway attached to the under side of the main beam, the main beam cut away for the said plate, and the auxiliary beam having a stud projecting within the plate and movable therein freely from side to side, substantially as described.

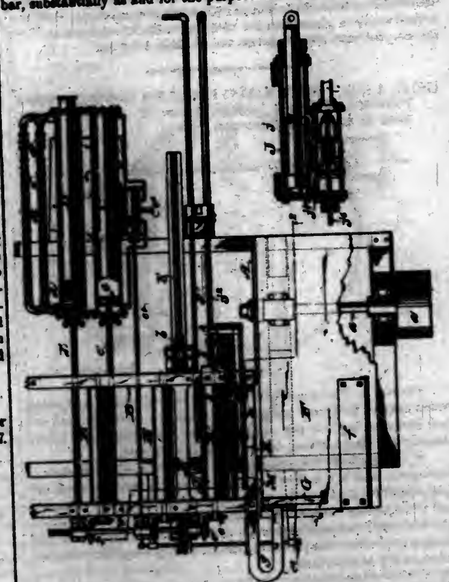
7. A plow comprising a main beam, an auxiliary beam situated below the main beam and pivoted at its front end to the main beam, the free end of the auxiliary beam provided with a plow-stock, the under side of the main beam having a curved plate with inclined walls and open from end to end, the auxiliary beam having a stud projecting within the said plate and correspondingly-tapered walls whereby the beam is supported and guided by the said plate and freely movable from end to end of the said guide-plate, substantially as described.

603,496. MEANS FOR ACTUATING INK-DISKS IN PLATEN PRINTING-PRESSES. FRANK A. DURHAM, Cleveland, Ohio, assignor to the Chandler & Price Company, same place. Filed July 22, 1897. Serial No. 645,554. (No model.)

Claim.—In a printing-press of the kind described, the oscillating ink-roller frame and a cam thereon, and a bell-crank lever pivoted on the press-frame and having a roller on one branch of said lever to travel on said cam and a segmental gear on the other branch, in combination with the ink-disk having a flange on its bottom, an arm pivotally supported beneath said disk and provided with teeth engaged by said segmental gear to actuate the arm, and a pivoted cam on said arm to engage the flange on the ink-disk and thereby rotate said disk, substantially as described.

603,497. BICYCLE. DANIEL W. CASWELL, Chicago, Ill., assignor to the Adams & Westlake Company, of Illinois. Filed Apr. 10, 1897. Serial No. 631,897. (No model.)

Claim.—In a combination tandem bicycle with its forward portion dropped, the following elements in combination: a steering-head, a front saddle-supporting bar having the forward crank-hanger at its lower end, a rear crank-hanger, an under inclined bar attached to the steering-head and to the forward crank-hanger, a horizontal bar connecting the forward and rear crank-hangers, an upper inclined bar attached to the steering-head above the under inclined bar and connecting with the front saddle-supporting bar, and a brace extending from said connection to the rear crank-hanger, substantially as set forth.



603,498. CUT-OFF MACHINE. FRANK CHALLONER, Oshkosh, Wis. Filed Dec. 14, 1894. Serial No. 531,512. (No model.)

Claim.—1. In a cut-off machine the combination with the saw, of a reciprocating carriage provided with a vertically-movable clamp and a horizontally-movable arm or part constructed and arranged when the carriage moves forward to press and hold the timber against the front side of the carriage, and means for operating said clamp controlled by said arm, substantially as and for the purposes set forth.

2. In a cut-off machine the combination with a saw and reciprocating carriage, of a vertically-movable clamp connected with and overhanging the carriage, a cylinder attached to the carriage, provided with a piston which is connected with said clamp and having a telescoping fluid-pressure-supply connection, a trip mounted upon the carriage and connected with the valve controlling the admission of the fluid-pressure medium to said piston, substantially as and for the purposes set forth.

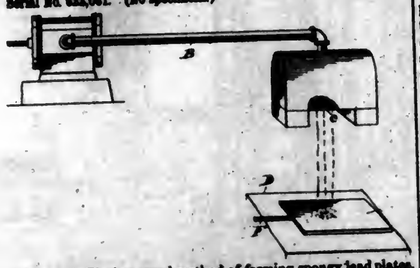
3. In a cut-off machine the combination with the saw and a reciprocating carriage, of a clamp connected with said carriage, a cylinder attached to said carriage and provided with a piston which is connected with said clamp, a valve controlling the admission and exhaust ports of said cylinder, a vertically-movable bar hinged or pivoted to the carriage parallel with its line of travel and connected with the stem of said valve, and a trip movably mounted upon said carriage and having a sliding connection with said bar, substantially as and for the purposes set forth.

4. In a cut-off machine the combination with the saw and a reciprocating carriage, of a clamp connected with said carriage, a cylinder attached to the carriage and provided with a piston which is connected with said clamp, a valve controlling the admission and exhaust ports of said cylinder, a rod or bar hinged to said carriage in a line parallel with its travel and connected with said valve, a trip mounted and movable on said carriage parallel with its travel, and having a retarding connection operating in opposition to the advance movement of the carriage, and a sliding connection with said hinged bar, substantially as and for the purposes set forth.

5. In a cut-off machine the combination with the saw and a reciprocating carriage provided with clamping mechanism for holding material thereon in position to be sawed, and comprising a cylinder, piston and controlling-valve, of trip mechanism comprising a bar or rod hinged to the carriage parallel with its line of travel, and connected with said valve, an arm mounted and movable upon said carriage parallel with said rod or bar and connected by a cable or chain passing over a sheave with a weight which opposes its advance movement, and a lever fulcrumed to said arm and having a yielding connection therewith, and a sliding connection with said rod or bar, substantially as and for the purposes set forth.

6. In a cut-off machine the combination with the saw and a reciprocating carriage, of an angular lever fulcrumed to a suitable support at one side of the carriage, a clamp pivoted to the end of said lever overhanging the carriage, a cylinder attached to said carriage and provided with a piston which is connected with the other arm of said lever, and a valve controlling the admission and exhaust ports of said cylinder and having telescoping supply and exhaust connections, substantially as and for the purposes set forth.

7. In a cut-off machine the combination with the saw and a reciprocating carriage, of a vertically-movable clamp connected with and overhanging said carriage adjacent to the plane of the saw, a cylinder attached to said carriage and provided with a piston which is connected with said clamp, a valve controlling the operation of said piston, a trip mounted and movable upon said carriage parallel with its line of travel, and having actuating connections with said valve and a retarding connection operating in opposition to the advance movement of the carriage, and a stop arranged to arrest said trip in its return movement with the carriage at the desired point, substantially as and for the purposes set forth.

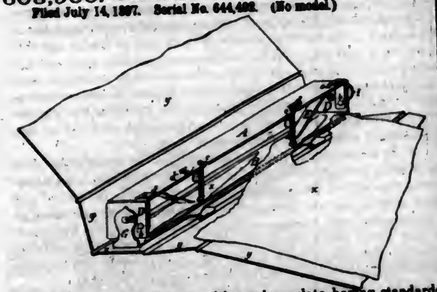


8. In a cut-off machine the combination with a reciprocating carriage, of an actuating-cylinder and piston connected therewith, and a retarding-cylinder provided with a piston also connected with said carriage and having by-passages between its opposite ends provided with oppositely-opening check-valves and with regulating-valves, substantially as and for the purposes set forth.

9. In a cut-off machine the combination with a reciprocating carriage and its actuating mechanism, of a controlling-cylinder containing a suitable retarding fluid and provided with a piston which is

connected with said carriage, and by-passages connecting the ends of said cylinder and provided with oppositely-closing check-valves and with regulating-valves, substantially as and for the purposes set forth.

10. In a cut-off machine the combination with the saw, of a reciprocating carriage provided with a vertically-movable clamp, an arm or part movable horizontally upon said carriage in a direction parallel with its travel, means tending to hold said arm or part from advancing with the carriage, a stationary stop arranged to engage and arrest said arm or part when the carriage approaches its starting-point in its return movement, and means for operating said clamp controlled by said arm, said arm and clamp cooperating to hold the timber firmly in place upon the carriage while it is being cut off by the saw, substantially as and for the purposes set forth.



608,499. ART OF MAKING PLATES FOR ELECTRIC-BATTERY PURPOSES. ALFRED C. CROSTAR, Chicago, Ill. Filed Feb. 5, 1897. Serial No. 622,061. (No specimens.)

Claim.—1. The improved method of forming spongy lead plates, which consists in forcing molten lead through a series of small orifices and allowing it to pile up just before solidifying upon a horizontally-vibrating surface; substantially as described.

2. The method of forming spongy lead plates, which consists in forcing the lead in a molten condition through a series of small orifices, receiving it at a temperature intermediate between a running and a congealing temperature upon a horizontally-vibrating support and afterward compressing certain portions of the spongy mass thus formed to produce comparatively solid strengthening ribs or frames, substantially as described.

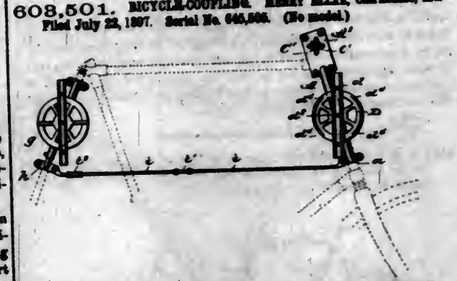
608,500. TEMPORARY BINDER. NATHAN ESSEX, Boston, Mass. Filed July 14, 1897. Serial No. 644,402. (No model.)

Claim.—1. A binder comprising a base-plate having standards at its ends and adapted to be secured in a cover, top and bottom plates pivoted together and also pivoted in the upturned end standards of the base-plate, and means carried by said top and bottom plates for receiving and retaining loose sheets.

2. A binder comprising a base-plate having upturned ends, top and bottom plates pivoted together, pins projecting from the bottom plate to receive loose sheets, and means for pivoting the top and bottom plates in the upturned ends of the base-plate.

3. A binder comprising a top plate and a bottom plate having overlapping ends, a base-plate having upturned ends, and studs for pivoting the top and bottom plates together and also in the upturned ends of the base-plate.

4. A binder comprising a top plate and a bottom plate having overlapping ends, a base-plate having upturned ends, studs for pivoting the top and bottom plates together and also in the upturned ends of the base-plate, and a nut threaded on one of the studs for holding the said parts against movement.



5. A binder comprising two elongated plates each having both ends bent at an angle so as to overlap the bent ends of the opposing plate, pivots passed through said overlapping ends and arranged longitudinally of the said plates, a nut on one of said pivots to hold the plates against movement relatively to each other, and pins carried by one plate to receive loose sheets, said sheets being retained thereon by the opposing plate.

6. A binder comprising two plates pivoted together, pins projecting from one plate to receive loose sheets, springs carried by the other plate to bear upon the sheets, and catches to hold the ends of the springs when raised.

7. A binder comprising two elongated plates, each bent at its ends into U form, so that the said ends of the said plates overlap, pivots passed through said ends longitudinally of said plates, a nut threaded onto one of said pivots to hold said plates relatively to each other, and pins secured in one plate and adapted to slide in open-ended slots extending from the edge of the opposing plates when the latter are parallel.

8. A binder comprising two elongated plates, each bent at its ends into U form, so that the said ends of the said plates overlap, pivots passed through said ends longitudinally of said plates, a nut threaded on one of said pivots to hold said plates stationary relatively to each other, pins carried by one plate for receiving loose sheets, and one or more tongues carried by one of the said plates for securing the binder in a cover.

608,501. BICYCLE-COUPLING. HENRY HILLS, Carbondale, Mo. Filed July 22, 1897. Serial No. 645,808. (No model.)

Claim.—1. In a coupling for bicycles, the combination with a longitudinally-expansible coupling-bar, of steering-heads having miter-gears attached thereto, miter-gears for engagement therewith and universal couplings between the gears and the ends of the expansible coupling-bar, substantially as shown.

2. In a coupling for connecting two bicycles side by side, a pair of divided or two-part frames each pair of frames being connected so that they may have a vertical and pivotal movement, clamps for connecting the same to the frames of the bicycles, in combination with steering-posts having miter-gears thereon and a telescopic connecting-bar having at its ends universal joints provided with miter-gears to engage those on the steering-post, housings or boxes in which sections of the universal joints are journaled, so as to hold the miter-gears thereof in mesh with the gears on the steering-heads, substantially as shown.

3. The combination with the coupling-frames for connecting two bicycles side by side, so that one may have a vertical movement independent of the other, a telescopic bar, universal joints and miter-gears connected thereto, of steering-posts having miter-gears with which the miter-gears connected to the telescopic bar mesh, substantially as shown.

4. In combination with the steering-posts of a pair of coupled bicycles, mitered gears secured thereon, of a telescopic connecting-bar, universal joints connected thereto and journaled in housings which engage the steering-heads of the bicycles and miter-gears connected with the universal joints so as to engage with the gears on the steering posts, substantially as set forth.

5. A coupling for bicycles, comprising cross-frames, the outer ends thereof having clamps for engagement with the frames of the bicycles, said frames also carrying disks or plates with lugs or projections thereon, slide-bars which engage pivotally with the disks and means for holding the same in sliding engagement with each other, substantially as shown and for the purpose set forth.

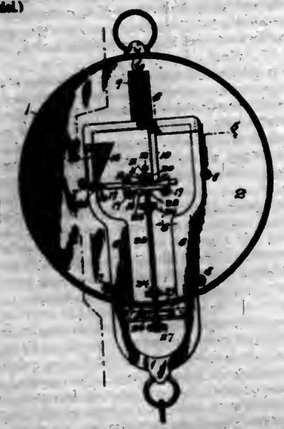
608,502. STEAM-GENERATOR. CHARLES H. FOX, Cincinnati, Ohio. Filed Nov. 30, 1896. Serial No. 613,910. (No model.)

Claim.—1. In an upright boiler, the combination of inner and outer shells forming an annular water and steam space, an annular series of circulating tubes or tube-sections below the normal water-level and communicating above and below with the water-space, and an independent central system of tubes or tube-sections extending from the top of the boiler down within the series of circulating tubes or sections, said central tube sections connected with the steam-space of the boiler above and with the water-space of the boiler below, substantially as set forth.

2. In a steam-generator, in combination with a vertical open-ended water and steam jacketed shell, of a plurality of independent, detachable steam-generating units each consisting of a number of parallel vertical tubes in a common axial plane, opening into headers above and below, arranged within the inclosing shell in parallel series extending from side to side, each unit having a central connection at the top, to the steam-space of the shell, and opposite end connections from the bottom, to the water-space of the shell, substantially as set forth.

3. In a steam-generator, in combination with a vertical water and steam jacketed inclosing casing, of a plurality of independent detachable generating-units, each consisting of a number of parallel vertical tubes in a common axial plane, connected by headers, and communicating with the casing above and below the water-level, respectively, each of said tubes being provided with means for circulation of water in opposite directions within the same below the normal water-level, substantially as set forth.

4. In a steam-generator, in combination with a vertical open-ended steam and water jacketed inclosing shell, of a plurality of independent detachable generating-units each consisting of a number of vertical tubes in a common axial plane, connected by headers communicating with the shell below and above the water-line, in combination with a corresponding plurality of independent superheating-coils arranged above the generating-units in the inclosing shell, and constituting the steam connections of said units respectively with the inclosing shell, substantially as set forth.



5. In a steam-generator, in combination with an open-ended cylindrical water and steam jacketed inclosing casing, of a plurality of independent detachable steam-generating units arranged in parallel series from side to side, each consisting of a series of vertical tubes united by a common top header, having a central connection thence with the steam-space of the inclosing casing, and two independent bottom headers, each connected with the water-space of the inclosing casing, substantially as set forth.

6. A steam-generator embodying in combination, a vertical open-ended casing consisting of a plain cylindrical outer shell and an inner shell contracted above the immediate fire-box giving an enlarged annular steam-space; a concentric series of tube-manifolds arranged within and contiguous to the lower part of the inner shell and opening above through the connecting-shoulder of the shells into the enlarged annular space below the normal water-line, and opening below into the fire-box water-leg; a series of vertical manifolds within the circular space thus inclosed, and extended above the normal water-line connecting below with the fire-box water-leg and above with the annular steam-space of the casing, substantially as set forth.

7. In a boiler of the character indicated, in combination with the vertical tubes of a tube-manifold extending from a point above to a point below the normal water-level, a shorter open-ended tube in each and concentric therewith extending from the lower header upward to a point below the water-level, and constituting an annular circulating-partition, substantially as set forth.

8. In combination with the upper and lower headers of a tube-manifold, and tubes connecting the same, of inner concentric tubular partitions, extending in each tube upwardly from the lower header to a point below the normal water-level, closed below by inclined surfaces and having lateral lower openings above said surfaces, substantially as set forth.

608,508. INDICATING OR LIKE MECHANISM FOR PRICE-SCALES OR OTHER MACHINES. FREDERICK I. FULLER, Trenton, N. J. Filed Jan. 5, 1897. Renewed Aug. 9, 1897. Serial No. 647,647. (No model.)

Claim.—1. An indicating or like mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

2. An indicating or like mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and manually-operated means for effecting such adjustment, substantially as described.

3. An indicating or like mechanism comprising an inclined member and a member coacting therewith and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

4. An indicating or like mechanism comprising an inclined member and a member coacting therewith and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, and manually-operated means for effecting such adjustment, substantially as described.

5. An indicating or like mechanism comprising an inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

6. An indicating or like mechanism comprising an inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and manually-operated means for effecting such adjustment, substantially as described.

7. An indicating or like mechanism comprising an inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

8. An indicating or like mechanism comprising an inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, and manually-operated means for effecting such adjustment, substantially as described.

9. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being movable

past the other to actuate said computing mechanism in accordance with the weight of the article, substantially as described.

10. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and manually-operated means for effecting such adjustment, one of said members being movable past the other to actuate said computing mechanism in accordance with the weight of the article, substantially as described.

11. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting therewith and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

12. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting there with and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment and manually-operated means for effecting such adjustment, one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

13. The combination with weighing mechanism, of price-computing mechanism comprising an inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, said actuator being movable past the other member to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

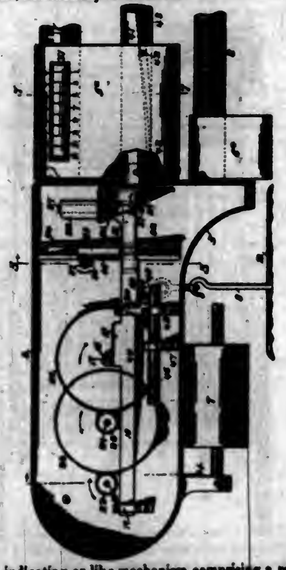
14. The combination with weighing mechanism, of price-computing mechanism comprising an inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment and manually-operated means for effecting such adjustment, said actuator being movable past the other member to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

15. The combination with weighing mechanism, of price computing mechanism comprising an inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of such adjustment, said actuator being movable past the other member to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

16. The combination with weighing mechanism, of price-computing mechanism comprising an inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of such adjustment and manually-operated means for effecting such adjustment, said actuator being movable past the other member to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

17. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being carried by a movable part of the weighing mechanism, substantially as described.

18. The combination with weighing mechanism, of price-computing mechanism comprising an inclined actuator carried by a movable part of the weighing mechanism, and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.



19. The combination with weighing-rod 6, of the inclined actuator 16, the inclination whereof varies progressively in a transverse direction, rack-bar 17, adjustable carriage 18 in which said rack-bar is mounted, and means for adjusting said carriage, substantially as described.

20. The combination with weighing-rod 6, of the inclined actuator 16, the inclination whereof varies progressively in a transverse direction, rack-bar 17, adjustable carriage 18 in which said rack-bar is mounted, means consisting of rack and pinion 25, 22 and rod 23, for adjusting the carriage, substantially as described.

608,504. INDICATING OR LIKE MECHANISM FOR PRICE-SCALES.

FREDERICK I. FULLER, Trenton, N. J. Filed Sept. 14, 1897. Serial No. 651,573. (No model.)

Claim.—1. An indicating or like mechanism comprising a rotary member and a member coacting therewith, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

2. An indicating or like mechanism comprising a rotary actuating member and a member actuated thereby, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, substantially as described.

3. An indicating or like mechanism comprising a rotary inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, substantially as described.

4. An indicating or like mechanism comprising a rotary inclined member and a member coacting therewith and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

5. An indicating or like mechanism comprising a rotary inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, substantially as described.

6. An indicating or like mechanism comprising a rotary inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

7. The combination with weighing mechanism, of price-computing mechanism comprising a rotary member and a member coacting therewith, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

8. The combination with weighing mechanism, of price-computing mechanism comprising a rotary actuating member and a member actuated thereby, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and connections between a movable part of the weighing mechanism and said actuating member for rotating the latter, substantially as described.

9. The combination with weighing mechanism, of price-computing mechanism comprising a rotary inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

10. The combination with weighing mechanism, of price-computing mechanism comprising a rotary inclined member and a member coacting therewith and adjustable transversely to the incline, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

11. The combination with weighing mechanism, of price computing mechanism comprising a rotary inclined actuator and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and connections between a movable part of the weighing mechanism and said actuator for rotating the latter, substantially as described.

12. The combination with weighing mechanism, of price-computing mechanism comprising a rotary inclined actuator, and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, and connections between a movable part of the weighing mechanism and said actuator for rotating the latter, substantially as described.

13. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary member and a member coacting therewith, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being movable past the other by the poise to actuate the computing mechanism, substantially as described.

14. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary actuating member and a member actuated thereby, one of which is inclined, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, and connections between the poise and actuating member for rotating the latter, substantially as described.

15. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being movable past the other by the poise to actuate the computing mechanism, substantially as described.

16. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary inclined member, and a member coacting therewith and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, one of said members being movable past the other by the poise to actuate the computing mechanism, substantially as described.

17. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary inclined actuator, and a member actuated thereby, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, and connections between the poise and actuator for rotating the latter, substantially as described.

18. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary inclined actuator and a member actuated thereby and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, and connections between the poise and actuator for rotating the latter, substantially as described.

19. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary actuating member axially parallel to the beam and a member actuated thereby, one member being inclined concentrically to the axis of the rotary member and the other member adjustable radially thereof, the inclination of the inclined member varying progressively in the direction of adjustment, and connections between the poise and actuating member for rotating the latter, substantially as described.

20. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary actuating member axially parallel to the beam and a member actuated thereby, one member being inclined concentrically to the axis of the rotary member and the other member adjustable radially thereof, the inclination of the inclined member varying progressively in the direction of adjustment, and a spiral cam connection between the poise and actuating member for rotating the latter, substantially as described.

21. The combination with a scale-beam and its poise, of price-computing mechanism comprising a concentrically-inclined rotary actuator axially parallel to the beam and a member actuated thereby and adjustable radially thereof, the inclination of the actuator varying progressively in the direction of adjustment, and connections between the poise and actuator for rotating the latter, substantially as described.

22. The combination with a scale-beam and its poise, of price-computing mechanism comprising a concentrically-inclined rotary actuator axially parallel to the beam and a member actuated thereby and adjustable radially thereof, the inclination of the actuator varying progressively in the direction of adjustment, and a spiral cam connection between the poise and actuator for rotating the latter, substantially as described.

23. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary concentrically-inclined actuator axially parallel to the beam, a rack actuated thereby and having a part adjustable radially thereof, the inclination of the actuator varying progressively in the direction of adjustment, indicating devices geared to said rack, and connections between the poise and actuator for rotating the latter, substantially as described.

24. The combination with a scale-beam and its poise, of price-computing mechanism comprising a concentrically-inclined rotary actuator axially parallel to the beam, a rack actuated thereby and having a part adjustable radially thereof, the inclination of the actuator varying progressively in the direction of adjustment, indicating devices geared to the rack, and a spiral cam connection between the poise and actuator for rotating the latter, substantially as described.

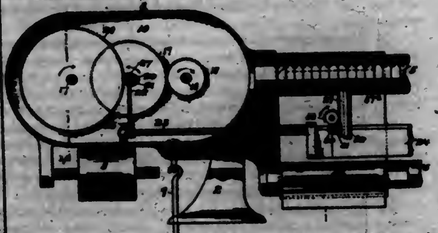
25. The combination with a beam scale and its poise, of price-computing mechanism comprising a rotary actuator operated by the poise, a member on the opposite side of the beam-fulcrum actuated thereby and movable thereby to and from said fulcrum, and a compensator movable reversely to said member, substantially as described.

26. The combination with a beam-scale and its poise, of price-computing mechanism comprising a rotary actuator operated by the poise, a rack-bar on the opposite side of the beam-fulcrum and movable thereby to and from said fulcrum, and a compensator rack-bar gearing therewith and movable thereby in the reverse direction, substantially as described.

27. The combination with a scale-beam and its poise, of shaft 41, spiral cam 43 thereon engaged by the poise, inclined member 21, rack-bar 18 and indicating devices geared therewith, substantially as described.

28. The combination with a scale-beam and its poise, of shaft 41, spiral cam 43 thereon engaged by the poise, inclined member 21, rack-bar 18, indicating devices geared therewith, transversely-adjustable bar 27 and means for adjusting it, substantially as described.

29. The combination with a scale, of a beam supporting price-indicating devices on one side of its fulcrum, a poise on the opposite side of the fulcrum, and adjustable connections between the poise and indicating devices for operating the latter in accordance with the weight and unit price of the article weighed, substantially as described.



30. The combination with a scale-beam and its poise, of price-indicating devices mounted on the beam in rear of its fulcrum, and adjustable connections, also mounted on the beam, between the poise and indicating devices for actuating the latter in accordance with the weight and unit price of the article weighed, substantially as described.

31. The combination with a scale-beam and its poise, of price-indicating devices mounted on the beam in rear of its fulcrum, connections, also mounted on the beam, between the poise and indicating devices for actuating the latter and adjusting mechanism also mounted on the beam for regulating the movement of the indicating devices, substantially as described.

32. The combination with a scale-beam and its poise, of price-indicating devices mounted on the beam in rear of its fulcrum, adjustable connections also mounted on the beam between the poise and indicating devices for actuating the latter in accordance with the weight and unit price of the article weighed, and a casing on the beam for inclosing the indicating devices, substantially as described.

608,505. INDICATING OR LIKE MECHANISM FOR PRICE-SCALES.

FREDERICK I. FULLER, Trenton, N. J. Filed Sept. 14, 1897. Serial No. 651,578. (No model.)

Claim.—1. An indicating or like mechanism comprising an inclined member, and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

2. An indicating or like mechanism comprising a pivoted inclined

member, and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

3. An indicating or like mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

4. An indicating or like mechanism comprising an inclined member, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

5. An indicating or like mechanism comprising a pivoted inclined member, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

6. An indicating or like mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

7. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

8. The combination with weighing mechanism, of price-computing mechanism comprising a pivoted inclined member and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment one of said members being movable past the other to actuate the computing mechanism in accordance with the weight of the article, substantially as described.

9. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, said actuator being movable past the inclined member to actuate the latter, substantially as described.

10. The combination with weighing mechanism, of price-computing mechanism comprising a pivoted inclined member, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, said actuator being movable past the inclined member to actuate the latter, substantially as described.

11. The combination with weighing mechanism, of price-computing mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, said actuator being movable past the inclined member to actuate the latter, substantially as described.

12. The combination with a scale-beam, of price-computing mechanism comprising an inclined member, and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, one of said members being movable along the beam past the other to actuate the inclined member, substantially as described.

13. The combination with a scale-beam, of price-computing mechanism comprising a pivoted inclined member and an actuator therefor, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, one of said members being movable along the beam past the other to actuate the inclined member, substantially as described.

14. The combination with a scale-beam, of price-computing mechanism comprising an inclined member, and an actuator therefor movable along the beam, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

15. The combination with a scale-beam, of price-computing mechanism comprising a pivoted member and an actuator therefor movable along the beam, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

16. The combination with a scale-beam, of price-computing mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor movable along the beam, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, substantially as described.

17. The combination with a scale-beam and its poise, of price-computing mechanism comprising an inclined member, and an actuator therefor movable by the poise along the beam to actuate the inclined member and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

18. The combination with a scale-beam and its poise, of price-computing mechanism comprising a pivoted inclined member, and an actuator therefor movable by the poise along the beam to actuate the inclined member and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

19. The combination with a scale-beam and its poise, of price-computing mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor movable by the poise along the beam and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, substantially as described.

20. The combination with a scale-beam, of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, one of said members being movable along the beam past the other to actuate the computing mechanism, substantially as described.

21. The combination with a scale-beam, of price-computing mechanism comprising a rotary inclined member and an actuator therefor movable along the beam, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, indicating devices, and worm-gearing connecting said inclined member and indicating devices, substantially as described.

22. The combination with a scale-beam, of price-computing mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor movable along the beam, said members being adjustable one relatively to the other transversely to the incline and said incline varying progressively in the direction of adjustment, indicating devices, and worm-gearing connecting said wing and indicating devices, substantially as described.

23. The combination with a scale-beam and its poise, of price-computing mechanism comprising a rotary inclined member and an actuator therefor movable by the poise along the beam to actuate the inclined member and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, indicating devices, and worm-gearing connecting said inclined member and indicating devices, substantially as described.

24. The combination with a scale-beam and its poise, of price-computing mechanism comprising a pivoted wing inclined in the direction of its axis, and an actuator therefor movable by the poise along the beam and adjustable transversely to the incline, said incline varying progressively in the direction of adjustment, indicating devices and worm-gearing connecting said wing and indicating devices, substantially as described.

25. The combination with weighing mechanism, of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other, indicating devices and worm-gearing connecting the actuated member with said indicating devices, substantially as described.

26. The combination with weighing mechanism of price-computing mechanism comprising an inclined member and a member coacting therewith, said members being adjustable one relatively to the other transversely to the incline, and said incline varying progressively in the direction of adjustment, indicating devices, and worm-gearing connecting the actuated member with said indicating devices, substantially as described.

27. The combination with the scale-beam and its poise, of the wing 24 pivoted in the scale-beam in line with the poise, indicating devices actuated thereby, actuator 29 and pinion 33 for adjusting said actuator, substantially as described.

28. The combination with the scale-beam and its poise, of the wing 24 pivoted in the scale-beam in line with the poise and on one side of its fulcrum, indicating devices on the opposite side of said fulcrum actuated by said wing, actuator 29 carried by the poise and pinion 33 for adjusting said actuator, substantially as described.

29. The combination with the scale-beam and its poise, of the wing 24 pivoted in the scale-beam in line with the poise, indicating devices, worm-gearing connecting said wing and indicating devices, actuator 29 and pinion 33 for adjusting said actuator, substantially as described.

30. The combination with the scale-beam and its poise, of the wing 24 pivoted in the scale-beam in line with the poise and on one side of its fulcrum, indicating devices on the opposite side of said fulcrum actuated by said wing, worm-gearing connecting said wing and indicating devices, actuator 29 carried by the poise and pinion 33 for adjusting said actuator, substantially as described.

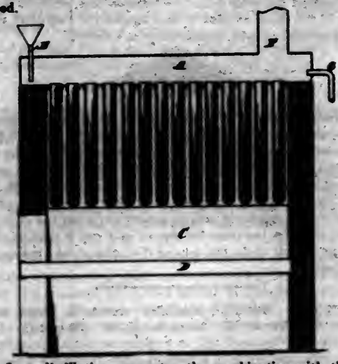
608,506. ACETYLENE-GAS GENERATOR. CLARENCE E. GILLETT and OTTO S. HELLWIG, Chicago, Ill.; said Hellwig assignor to said Gillett; said Gillett assignor to The Gillett Generator Company, same place. Filed Sept. 13, 1897. Serial No. 651,513. (No model.)

Claim.—In gas-generators, the combination with the retort and its controllable outlet, of the separate water-tank, the percolator interposed between said retort and tank discharging at one side of its obstructive wad into the retort and at its opposite communicating with the tank beneath the water-level therein and the closed cushion-trap for gas joined to the percolator on the tank side of its wad and above the water-inflow to the percolator, substantially as described.

608,507. TROUSERS-PROTECTOR. PETER C. GOLDEN, Brockton, Mass. Filed Mar. 6, 1897. Serial No. 626,307. (No model.)

Claim.—1. As an article of manufacture, a wear-protector for the lower edge of a garment, consisting of a strip to be secured against the garment material, and having a flange at its lower edge to lap under the edge of the garment material, and securing-prongs extending up from said flange parallel to said strip, said prongs extending above the upper edge of the strip, substantially as described.

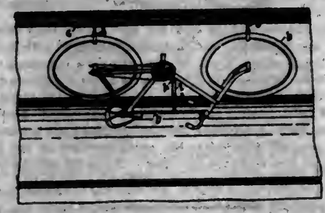
2. As an article of manufacture, a wear-protector for the lower edge of a garment, consisting of a strip to be secured against the garment material, and having a flange at its lower edge to lap under the edge of the garment material, and securing-prongs extending up from said flange parallel to said strip, said prongs extending above the upper edge of the strip, and said strip having a slot for stitches adjacent its upper edge, substantially as described.



608,508. APPARATUS FOR DISTILLING ACIDS. EDWARD HART, Easton, Pa., assignor to the Baker & Adamson Chemical Company, same place. Filed June 16, 1896. Serial No. 595,766. (No model.)

Claim.—1. A distillation apparatus having a receiver, a series of small distillation-tubes depending from said receiver and providing extended heating-surfaces, said tubes being closed at the bottom but open at the top to receive liquid from the receiver, a vapor-outlet at the top of the receiver, and an outlet from the receiver for the undistilled liquid, substantially as described.

2. A distillation apparatus for acids and other corrosive substances having a receiver, and a series of small distillation-tubes of fragile material closed at the bottom and depending from and having their open ends removably connected to said receiver, substantially as described.



3. A distillation apparatus for acids and other corrosive substances having a receiver, a series of small distillation-tubes of fragile material closed at the bottom and depending from and having their open ends removably connected to said receiver, a vapor-outlet at the top of the receiver, and an outlet from the receiver for the undistilled liquid, substantially as described.

4. In a distillation apparatus, the combination with the main boiler-tube or receiver, A, of the small tubes B arranged along said receiver and depending therefrom, an inlet at one end of the receiver for the liquid to be distilled, an outlet G for the undistilled liquid at the opposite end of the receiver, and a vapor-outlet, substantially as described.

5. In a distillation apparatus, the combination with the main boiler-tube or receiver A, of the small tubes B of fragile material arranged along said receiver and depending therefrom and having their open ends removably connected to the receiver, an inlet at one end of the receiver for the liquid to be distilled, an outlet G for the undistilled liquid at the opposite end of the receiver, and a vapor-outlet, substantially as described.

608,509. BICYCLE-SUPPORT FOR RAILWAY-CARS. GEORGE I. KAHLE, Council Bluffs, Iowa, assignor to Frank W. Whitcher, Boston, Mass. Filed May 24, 1897. Serial No. 637,979. (No model.)

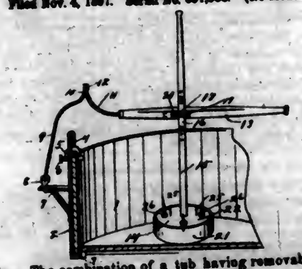
Claim.—1. A bicycle-support for railway cars or coaches in the combination of three hooks fastened to the roof and side of the car or coach, and constructed and arranged to hold the wheels and frame of a bicycle as near as possible in a plane parallel to the roof of the car or coach, and directly beneath the same; all substantially as set forth and described.

2. The combination in a support for bicycles in railway cars and coaches, of a symmetrical double hook, *c*, fastened to the middle of the car-roof; a hook *d*, hinged to the bracketed bar, *e*, which bar *e* is fastened to the roof of the car, one on each side of the middle line of the said roof; and the hook, *j*, attached by the strap, *i*, and the screw-eye *h*, one to each side of the car; together and in conjunction forming a support for two bicycles; all substantially as set forth.

3. The combination in a bicycle-support for railway cars or coaches, of a series of hooks, in which the hook, *d*, is hinged on the bracketed bar, *e*, so it may at the same time be slid along said bar and turned thereon; all substantially as set forth and described.

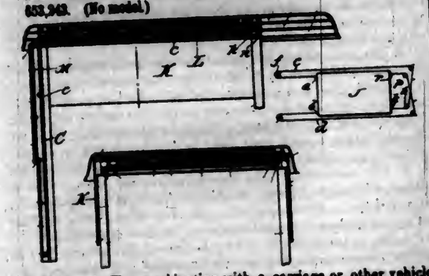
4. The combination in a bicycle-support for railway cars or coaches of a series of hooks, of which the hook, *j*, is connected to a screw-eye, *h*, by means of the strap, *i*, in such manner that the hook engages the frame of the bicycle when the screw-eye, *h*, is screwed to the side of the car; all so arranged for operation and use as described.

5. A bicycle-support for railway cars or coaches in the combination of three hooks covered with soft material, fastened to the roof and side of the car or coach, and arranged and adapted to hold the wheels and the frame of a bicycle as near as possible in a plane parallel to the roof of the car or coach, and directly beneath the same; all substantially as set forth and described.



608,510. INFLATION-TUBE. JOHN G. MACFARLANE, St. Joseph, Mo. Filed June 30, 1897. Serial No. 643,269. (No model.)

Claim.—1. The combination of a pneumatic or inflatable tire, a threaded inflation-tube secured in the tire and having its outer end threaded to engage the inflation-tube and having the flat inner side arranged closely adjacent to the exterior of the tire, and the cap with the recess therein and the packing arranged in said recess and bearing against the outer end of the inflation-tube, whereby the inner flat side of the cap is enabled to bear against the outside of the tire around the inflation-tube, substantially as specified.



2. The combination of a pneumatic or inflatable tire, a threaded inflation-tube secured in the tire with its outer end closely adjacent to the exterior of the tire and so arranged that, when the tire is placed on a wheel-rim, it will rest entirely outside said rim, and the cap or convex-plano form in cross-section threaded to engage the inflation-tube and having the recess in its inner side and the packing arranged in said recess and bearing against the outer end of the inflation-tube, whereby the inner flat side of said cap is enabled to bear against the outside of the tire around the inflation-tube, substantially as specified.

608,511. WASHING-MACHINE. JOSHUA D. MOORE, Orrville, Ohio. Filed Nov. 4, 1897. Serial No. 657,208. (No model.)

Claim.—The combination of a tub having removably attached thereto the bar 2, provided at its bottom or lower end with the hook 3, and the elongated slot 4, the adjustable clamp 5, connected to the bar 2, and to the tub, the arm 7, provided with the swivel-eye 8, connected to the bar 2, the rod 9, provided with the integral curved portion 10, the rod 11, having connected thereto the operating-lever 13, the pounding-head 14, provided with the handle 15, the flat connecting-bar 16, pivotally attached to the operating-lever 13, and the L-shaped bolt 17, provided with the collar or flange 19, and the nut 18, substantially as and for the purpose specified.

608,512. CURTAIN FOR VEHICLES. CHARLES J. ROSEBROOK and SHEPARD BERNHAM, Dixon, Ill. Filed Sept. 27, 1897. Serial No. 653,943. (No model.)

Claim.—1. The combination with a carriage or other vehicle, having false roofs, thereby forming pockets or chambers, of side and end curtains or flaps adapted to be received or stored respectively in such chambers and operating-cords for each of such curtains or flaps, said cords being connected at the respective ends thereof to the top and bottom edges of such curtains, whereby said curtains may be raised and lowered and constantly maintained in stretched condition, as and for the purpose set forth.

2. The combination with a carriage or other vehicle top having false roofs or partitions, thereby forming chambers or recesses in the roof thereof, of side and end curtains or flaps arranged to be received and stored respectively in said chambers or recesses and cords connected at the respective ends thereof to the bottom and top ends of each of said curtains, and guides arranged in said roof over which said cords operate, whereby said curtains may be raised and lowered and constantly maintained in stretched condition, as and for the purpose set forth.

3. The combination with a carriage or other vehicle top having partitions, thereby forming independent chambers or recesses in the roof thereof, of side and end curtains or flaps arranged to operate and to be stored respectively in said chambers or recesses, means for guiding said curtains or flaps and operating-cords connected at the respective ends thereof to the bottom and top edges or ends of each of said curtains or flaps, and guides arranged in the respective chambers in said roof over which said cords operate, as and for the purpose set forth.

4. The combination with a carriage or other vehicle, of slidable curtains and means for operating said curtains, and constantly maintaining the same in stretched condition, comprising operating-cords connected at the respective ends thereof to diagonal corners of said curtains or flaps and guides over which said cords operate, as and for the purpose set forth.

5. In a carriage or other vehicle, corner supports or standards, slidable curtains or flaps, operating-cords connected at the ends thereof to the top and bottom edges of said curtains at diagonally opposite points, and a support or guide arranged adjacent to the ends of said standard over which said cords operate, as and for the purpose set forth.

6. In a carriage or other vehicle, tubular corner standards or supports, said supports being slitted longitudinally, slidable curtains or flaps, guides connected to the edges of said curtains or flaps and arranged to project through said slits or openings and into said tubular standards, operating-cords arranged within said tubular standards and connected at the ends thereof to the edges or ends of said curtains or flaps, guides arranged in said standards and over which said cords operate, as and for the purpose set forth.

7. In a carriage or other vehicle, a roof having partitions, thereby forming independent pockets or chambers, corner-standards for supporting said roof, slidable end and side curtains or flaps, guides arranged adjacent to the lower ends of said standards, other guides arranged within the chambers in said roof, and operating-cords connected at the respective ends thereof to the top and bottom edges or ends of each of said curtains and arranged to pass around said guides, as and for the purpose set forth.

8. In a carriage or other vehicle, a roof having pockets or chambers, tubular corner standards or supports therefor, guides arranged within the lower ends of said tubular standards, slidable curtains, operating-cords connected at the respective ends thereof to the bottom and top ends of the curtain, said cords arranged within said tubular support and adapted to pass over said guides, and other guides arranged in the chambers in said roof and over which said cords are arranged to pass, as and for the purpose set forth.

608,513. MEANS FOR MAKING WEDGES FOR SPLITTING STONE, &c. EDWARD B. ROTH, St. Louis, Mo. Filed Aug. 19, 1897. Serial No. 648,796. (No model.)

Claim.—1. A pair of dies for forming wedges and the like, having a pair of opposing inclined faces, a pair of opposing concave faces, and a pair of opposing flat faces preventing the other faces from coming in contact.

2. A pair of dies for forming wedges and the like, having a pair of opposing inclined faces, a pair of opposing convex faces, a pair of opposing concave faces, and a pair of flat faces preventing the other faces from coming in contact.

3. A pair of dies for forming wedges and the like, having a pair of opposing inclined faces, a pair of opposing faces each having two depressions corresponding to the form of head desired on the tool, and a pair of flat faces preventing the other faces from coming in contact.

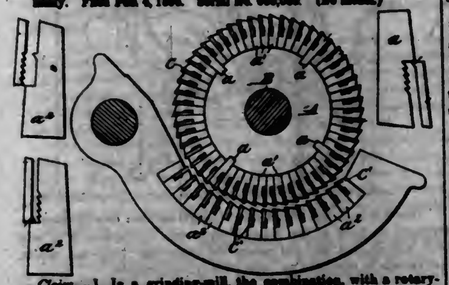
4. A pair of dies for forming wedges and the like, having a pair of opposing inclined faces, a pair of opposing convex faces, a pair of opposing concave faces, a pair of faces having formed thereon two depressions corresponding to the form of head desired on the tool, and a pair of flat faces preventing the other faces from coming in contact.

608,514. GAME-COUNTER. JOSEPH SCHNEIDER, San Francisco, Cal., assignor of one-half to William Wolf, same place. Filed Dec. 2, 1896. Serial No. 614,373. (No model.)

Claim.—1. In a game coasting or scoring board, the combination with the open frame-plate divided into sections by a central rib or division-strip, of a score-plate located in each section, the communicating ways at each side of the score-plates, of the sockets or slots for the scoring-pegs formed in each side of the score-plates, said sockets or slots communicating with the side ways, and of the scoring-pegs fitted to move within the side ways and sockets of the score-plates.

2. In a game-counter or scoring-board, the combination with an open frame-plate divided into sections by an intermediate strip or rib, of a score-plate located in each section provided on two opposite edges with sockets or slots for the scoring-peg said sockets on each edge of the score-plate communicating with a way which ways communicate only at the ends of the score-plates, and a scoring-peg adapted to move in said sockets and ways.

3. In a game-counter or scoring-board, the combination of a base-board having its face countersunk or recessed and provided with three parallel longitudinal partitions, an open frame-plate secured on said base-board and projecting inwardly beyond the edge of the countersink or recess, a central strip or rib secured on the central partition and overhanging the same, and a score-plate secured to the remaining partitions on each side of the central strip intermediate the frame and central strip and intermediate the ends of the open frame, said score-plates having portions overhanging the partitions to which they are secured and provided with notches or slots, and non-removable pegs adapted to be moved in the spaces between the frame and score-plates.



608,515. ELECTRICAL APPARATUS. WILLIAM STANLEY, Pittsfield, Mass., assignor to the Stanley Instrument Company, of Massachusetts. Filed Jan. 25, 1897. Serial No. 621,057. (No model.)

Claim.—1. In an electrical apparatus, two coils in series with each other, and with a source of alternating current, in combination with two shunts, one of low, the other of greater time-constant than the coils which they respectively shunt, and a closed circuited armature in direct inductive relation to the fluxes produced by both coils, substantially as described.

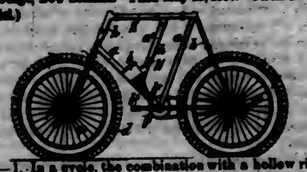
2. In an electric meter, two coils in series with each other and with a source of alternating current, in combination with two shunts, one of low, the other of greater time-constant than the coils which they respectively shunt and a closed circuited armature in direct inductive relation to the fluxes produced by both coils, together with suitable retarding and registering devices, substantially as described.

608,516. GRINDING-MILL. FRIEDRICH STELLE, Langerfeld, Germany. Filed Feb. 4, 1893. Serial No. 668,502. (No model.)

Claim.—1. In a grinding-mill, the combination, with a rotary-grinder hub, having a plurality of channels, an abutment cutter-holder firmly secured in each channel, and a plurality of cutter-holders arranged around the periphery of the grinder-hub and fitting tightly between the abutment cutter-holders, all the cutter-holders being wedge shape in cross-section and having the homologous points in their outer faces equidistant from the axis of the grinder-hub, and each provided with a rabbet extending inward along one face of the respective cutter-holder and provided with a series of notches, of cutters arranged to fit snugly in the rabbets, each cutter being provided with a tooth arranged to enter any desired one of the series of notches, substantially as described.

2. In a concave for grinding-mills, the combination, with a series of cutter-holders wedge shape in cross-section and arranged to fit closely against each other, said cutter-holders each having a rabbet provided with a series of notches of a cutter fitting snugly in each rabbet and provided with a tooth arranged to enter any desired notch of its respective series, substantially as described.

608,517. BUTTON. CHARLES W. STIMSON, New York, N. Y. Filed May 20, 1897. Serial No. 638,709. (No model.)



Claim.—1. In a button for button-and-loop clasps, the combination, with a base-plate, of washers of elastic material forming the neck or shank and the head of the button, and a fastening device securing said washers to the base-plate and to each other, substantially as described.

2. In a button for button-and-loop clasps, the combination, with a base-plate, of washers of elastic material forming the neck or shank and head of the button, and a rivet uniting said washers to the base-plate and to each other, substantially as described.

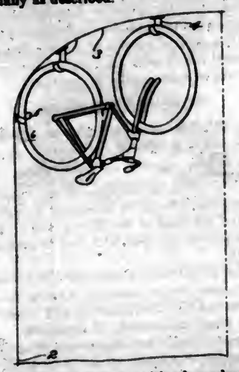
3. In a button for button-and-loop clasps, the combination, with a base-plate, a washer or washers of felt forming the neck of the button, and a washer of similar material of larger diameter forming the head, of a headed rivet passing through said washers and secured to the base-plate, thereby securing said washers to each other and to the base-plate, substantially as described.

4. In a button for button-and-loop clasps, the combination, with a base-plate, and washers forming the neck or shank and head of the button, of a rivet secured to the base-plate and securing said washers thereto and to each other, and a sleeve surrounding said rivet, substantially as described.

608,518. MECHANISM FOR PROPELLING VEHICLES. HENRY STIMS, Otago, New Zealand. Filed May 15, 1897. Serial No. 636,613. (No model.)

Claim.—1. In a cycle, the combination with a hollow rigid tire, of a plurality of pump-barrels extending radially across said tire and projecting outside of the same, and secured to the tire at each end, pistons in said pump-barrels, spring-valves in said pistons, and piston-rods projecting radially beyond the pump-barrels, substantially as described.

2. In a cycle, the combination with a hollow rigid tire, having in its periphery a series of screw-threaded openings, of a plurality of pump-barrels screwed into said openings, pistons in said barrels, spring-valves in the pistons, piston-rods extending beyond the periphery of the tire, and springs for keeping the piston-rods normally projected, substantially as described.



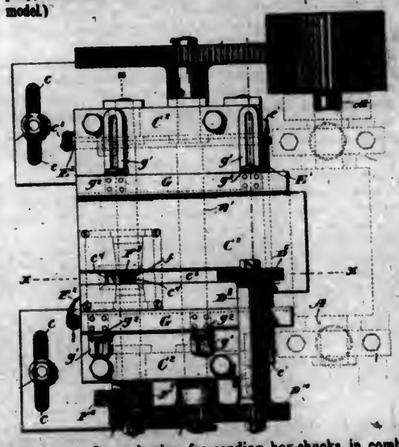
3. In a cycle, the combination with a hollow metallic tire, having a plurality of openings in its periphery, of screw-threaded bosses secured to the tire at said openings, a plurality of pump-barrels having screw-threaded collars to screw into said bosses, plates inside the tire to receive the inner ends of the pump-barrels, valved pistons in the pump-barrels, and spring-actuated piston-rods projecting beyond the outer ends of the pump-barrels, substantially as described.

4. In a cycle, the combination with a hollow tire, of a pump-barrel secured radially thereto, having its outer portion of larger diameter than its inner portion, a piston in the inner portion, a spring-valve in said piston, a piston-rod having a collar fitting in the outer portion of the barrel, a helical spring housed in said outer portion and acting against said collar, and an annular cap on the outer end of the barrel to limit the outward movement of the piston-rod, substantially as described.

5. In a cycle, the combination with a hollow rigid tire, of a pump-barrel secured radially thereto, having inlet-ports in its inner end, an elastic band surrounding and covering said ports, a valved piston in the pump-barrel, and a piston-rod projecting beyond the periphery of the tire, substantially as described.

608,519. BICYCLE-SUPPORT. GEORGE H. WILLIAMS, Newton, Mass. Filed Apr. 22, 1897. Serial No. 633,263. (No model.)

Claim.—1. The combination with a car, of hooks or hangers applied to the ceiling and adapted to support a bicycle in inverted position depending from the said ceiling, and a retainer engaging with the bicycle to prevent swinging or oscillating movement thereof, substantially as described.



2. The combination with a car, of hooks or hangers applied to the ceiling and adapted to engage with the rims of the wheels of a bicycle to hold the bicycle in inverted position depending from the ceiling, and a retainer also engaging with one of the said wheels to prevent the bicycle from swinging or oscillating, substantially as described.

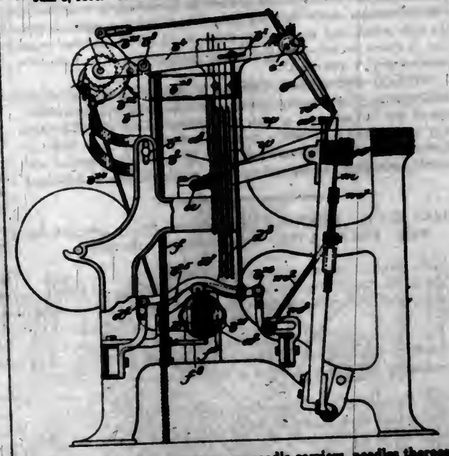
3. The combination with a car, of hooks or hangers applied to the ceiling and adapted to engage with the rims of the wheels of a bicycle to hold the bicycle in inverted position depending from the ceiling, and the retainer applied to one of the vertical sides of the car, and also engaging with one of the said wheels to prevent the bicycle from swinging or oscillating, substantially as described.

4. The combination with a car, of hooks or hangers applied to the ceiling of a car, arranged in a diagonal line crosswise of the car, the said hooks or hangers being adapted to engage with the rims of the wheels of a bicycle to hold the bicycle in inverted position depending from the ceiling, and the retainer applied to one of the vertical sides of the car and also engaging with one of the said wheels to prevent the bicycle from swinging or oscillating, the said wall-retainer having its fork disposed in an inclined position, substantially as described.

5. The herein-described ceiling hook or hanger having the elongated base disposed at an angle to the hook portion to facilitate the application of the hook or hanger to the surface of a curved ceiling, substantially as described.

608,520. MACHINE FOR SANDING BOX-SHUCKS. JACOB P. WEBER, New Haven, Conn., assignor to the Diamond Match Company, Chicago, Ill. Filed Dec. 22, 1896. Serial No. 616,811. (No model.)

Claim.—1. In mechanism for sanding box-shucks, in combination with the shuck-supporting table having a groove in its upper face, an opening for the glue-applying device, in line with such groove, and a second opening in the bottom of the groove beyond the first opening, a glue-applying device to apply glue to the shucks through the first opening, and means for applying sand to the glued part of the shucks through the second opening, substantially as and for the purpose specified.



2. In mechanism for sanding shucks, in combination with the shuck-supporting table, provided with a groove, the glue-applying wheel projecting up through an opening in the table, in line with the groove in the latter, means for supplying glue to such wheel, a sand-containing box or receptacle, and means for delivering sand therefrom, through an opening in the bottom of the groove in the table, against the glued part of the shucks, brought over such opening by the feeding of the shucks over the table, substantially as and for the purpose shown.

3. In combination with the table provided with the opening for the passage of the glue-applying device, a groove extending from such opening, and a second opening in the bottom of the groove, the glue-applying wheel projecting up through the first opening, means for supplying such wheel with glue, a sand-containing box below the second opening in the table, a sand-throwing wheel in the box, adapted, as it revolves, to throw the sand up through the opening in the table, and means for rotating the glue-applying and sand-throwing wheels, substantially as and for the purpose set forth.

4. In combination with the table, having an opening for the glue-applying wheel, a groove extending out along the table in line with such opening, and a second opening in the bottom of such groove having its sides undercut, the glue-applying wheel projecting up through the first opening in the table, means for supplying it with glue, the sand-containing box below the second opening, the sand-throwing wheel revolving in such box and having arms or blades to engage the sand in the box and throw it up through the opening above the box, and means for rotating the two wheels, substantially as and for the purpose described.

5. In combination with the box for containing sand, the sand-throwing wheel rotating therein, having blades or arms to engage and throw the sand, the shaft carrying such wheel, and the tubular bearing for the shaft extending in around the latter, from the walls of the sand-box, to the sides of the sand-throwing wheel, substantially as and for the purpose specified.

608,521. LAPPET-LOOM. ISRAEL WYMAN, Worcester, Mass., assignor to the Crompton & Knowles Loom Works, same place. Filed Jan. 6, 1896. Serial No. 574,625. (No model.)

Claim.—1. A lay, one or more needle-carriers, needles thereon arranged in front of the lay and supported independently of and from behind said lay, and means for imparting rising and falling movements to said needles, substantially as described.

2. A loom containing the following instrumentalities, viz: a lay provided with a reed, shedding mechanism, one or more needle-carriers arranged in front of the lay and supported independently of the latter, a needle or needles on the respective carriers, and means to impart to said carriers vertical forward-and back, and laterally-progressive movements, substantially as described.

3. A loom containing the following instrumentalities, viz: a lay provided with a reed, shedding mechanism, one or more needle-carriers and a needle or needles on the respective carriers, a swinging support in which said carrier or carriers is or are swingingly mounted, means to move said carrier or carriers in their respective supports, and a source of thread-supply mounted upon said carriers, substantially as described.

4. In a loom, a combination with the frame, a lay provided with a reed, shedding mechanism, one or more needle-carriers arranged in front of said reed and supported from the back of said lay and independent of the latter, needles on the said carriers, means to impart to said needle-carriers rising and falling movements, and also a forward-and-back movement, following the movements of the lay, and the rising and falling shuttle-guide pins mounted on said lay, substantially as described.

5. In a loom, a frame, a lay provided with a reed, and a shedding mechanism, combined with one or more needle-carriers, and needles for the same, swinging needle-carrier supports fulcrumed above and independent of said lay and in which the said carriers are swingingly mounted, and means to actuate the said carriers, substantially as described.

6. In a loom, the combination with the frame, a lay provided with a reed and the shedding mechanism, of one or more depending needle-carriers fulcrumed above and behind said lay and means to swing said carriers forward and back to clear said lay, needles on the said carriers, and means for actuating the same and their carriers, substantially as described.

7. In a loom, a frame, a lay having a reed and shedding mechanism, combined with one or more needle-carriers mounted independently of the lay and in front of the reed thereon, needles on the said carrier or carriers, a cam for determining the movements of the said carrier or carriers, and means to move the said carrier or carriers independently of said cam, substantially as described.

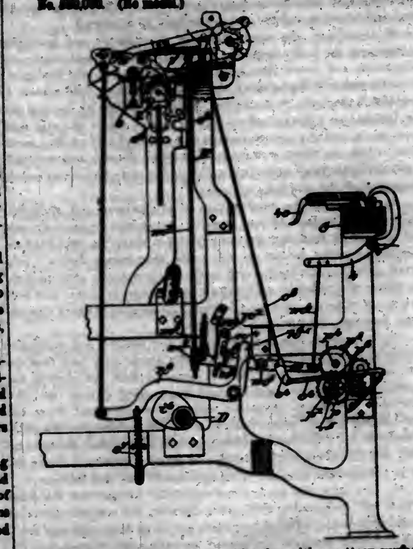
8. In a loom, a frame, a lay provided with a reed and shedding mechanism, combined with a needle-carrier arranged in front of said reed, a needle-carrier support fulcrumed above and at the back of said lay, a cam determining the movements of said carrier, and means to vibrate the said carrier independently of and within limits fixed by said cam, substantially as described.

9. In a loom, a frame, and a lay provided with a reed, combined with one or more needle-carriers and needles thereon, swinging supports independent of the lay, and means both to rotate and slide said needle-carriers therein, substantially as described.

10. In a loom, a frame, a lay provided with a reed, and a shedding mechanism, combined with one or more needle-carriers and needles on the same, swinging supports in which the said needle-carriers are mounted to vibrate, one or more cams on the said swinging supports and connected with and to determine the movements of the said carrier or carriers, and means on the said swinging supports to move said carrier or carriers independently of said cam or cams, substantially as described.

11. In a loom, a frame, a lay provided with a reed, and a shedding mechanism, combined with a needle-carrier, mounted independently of the lay, and having a swinging movement following the movements of said lay and such that the length of thread from the needle to the fell of the fabric, when the needle is in each of its extreme positions, shall be substantially the same, substantially as described.

12. In a loom, a frame, a lay provided with a reed, and a shedding mechanism, combined with a needle-carrier, one or more needles mounted therupon, means to vibrate said needle-carrier, a cam, and a lever straddling said cam, and coöperating therewith to determine the movement of the said carrier and the pattern produced by the said needles, and means to move said carrier in opposite directions independent of and within limits fixed by said cam, substantially as described.



13. In a loom, a frame, a lay provided with a reed, and a shedding mechanism, combined with a needle-carrier, one or more needles mounted therupon, a cam, a lever to vibrate said carrier forked at one end to straddle said cam, means to vibrate said lever within limits determined by said cam, and means to vary the said vibratory movement relatively to the said cam, substantially as described.

14. In a loom, a frame, a lay and a harness mechanism, combined with a plurality of needle-carriers, needles arranged thereon, and cams for the respective carriers, and actuating-levers for the respective carriers having forked ends straddling the cams therefor, and means to vibrate said levers within the limits determined by said cams, substantially as described.

15. In a lappet-loom, lappet-needles, carriers therefor, and means to move the said needles such that the length of thread from the needles to the fell of the fabric during the insertion of the weft and during the beating up of the lay is substantially the same to obviate slackening of the thread, substantially as described.

16. In a lappet-loom, the needles, carriers therefor, thread-guides to conduct the threads to the needles, and means to move said needles such that the threads conducted thereto by said thread-guides shall be held under suitable tension during the laying in of said threads and during the beating up of the same.

608,522. SHUTTLE-BOX-OPERATING MECHANISM FOR LOOMS. ISRAEL WYMAN, Worcester, Mass., assignor to the Crompton & Knowles Loom Works, same place. Filed Feb. 20, 1896. Serial No. 580,020. (No model.)

Claim.—1. In a loom, the combination with a pattern-surface and its feed device, a multiplier and its feed device and a disengaging device, of an automatic stop mechanism, connections between said stop mechanism and said disengaging device and operating through the latter to throw both the said feed devices out of action on automatic stopping of the loom by the said stop mechanism, and means to retain said feed devices out of action after release of the same by said automatic stop mechanism, substantially as described.

2. In a loom, the combination with a pattern-surface and its feed device and a multiplier and its feed device, of an automatic stop mechanism, connections between said stop mechanism and said pattern and multiplier feed devices for throwing both the latter out of action on automatic stopping of the loom by the former, a holding device and means to operate it to retain the said feed devices out of action for one or more picks of the loom after starting the latter, substantially as described.

3. In a loom, the combination with pattern and multiplier mechanisms and feed devices therefor, and actuating means to alternately operate the said feed devices, of an automatic stop mechanism for said loom, a disengaging device and connections between the same and said stop mechanism whereby the former is automatically moved to disengage said feed devices on automatic stopping of the loom by the latter, and means operable independent of said actuating means to retain said alternately-acting feed devices out of action through one or more picks of the loom, substantially as described.

4. In a loom, the combination with the pattern and multiplier ratchets, feed-pawls therefor, and means to actuate the latter, of an automatic stop mechanism and connections between the same and said feed-pawls for automatically disengaging the latter from their respective ratchets on automatic stopping of the loom by the former, and means to retain said feed-pawls in their disengaged positions through one or more picks of the loom, substantially as described.

5. In a loom, the combination with the pattern and multiplier mechanisms, and the feed devices therefor, of a single disengaging device operable independent of but coöperating with both said mechanisms to move the said feed devices out of action, an automatic stop mechanism and connections between the same and said disengaging device to move the latter by or from the former.

6. In a loom, the combination with the pattern and multiplier mechanisms, feed-wheels therefor, the oppositely-acting feed-pawls coöperating therewith, and a common actuator for the said feed-pawls, of an automatic stop mechanism, means actuated thereby for lifting said feed-pawls out of engagement with their respective feed-wheels on automatic stopping of the loom, and means to retain said feed-pawls in their lifted disengaged positions, through one or more picks of the loom, substantially as described.

7. In a loom, the combination with the pattern and multiplier mechanisms; ratchet-wheels therefor; the feed-pawls; the common

actuator for the same; and the lifters for the respective pawls, of the disengaging-device for simultaneously-disengaging both pawls; the lever to which said disengaging device is connected; the automatic stop mechanism for operating said lever; the holding device for said lever and means to release it, substantially as described.

8. In a loom, the combination of the pattern and multiplier mechanisms, the feed-wheels and feed-pawls therefor, automatic stop mechanism, and connections between the latter and said feed-pawls for automatically disengaging the latter and their feed-wheels on stopping of the loom by the former, means controlled by the said pattern mechanism automatically to throw out of action the said feed-pawls at the end of a predetermined movement of said pattern mechanism; a take-up roller, and means controlled thereby automatically to put said feed-pawls again into action at the end of a predetermined movement of the said take-up roller.

9. In a loom, the combination of the pattern and multiplier mechanisms; the feed devices therefor; a common actuator for said feed devices; a feed-disengaging device for throwing said feed devices out of action, a lever to which said disengaging device is connected, a holding device for said lever; the automatic stop mechanism, means controlled by said pattern mechanism to throw said feed devices out of action; a take-up roller, and means governed thereby to put said feed devices again into action.

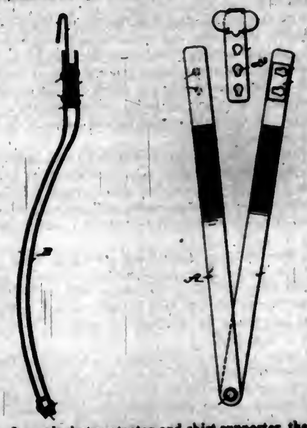
10. In a loom, the combination of the pattern and multiplier mechanisms, the feed devices therefor, the actuator for said feed devices, a feed-disengaging device for throwing said feed devices out of action, a lever for operating said disengaging device, the automatic stop mechanism connected with and to move said lever, the lever-holding device, means controlled by the pattern-surface automatically to move said lever to disengage said feed devices, the take-up roller, and means controlled thereby to move said lever-holding device to release said lever for reengagement of the feed devices.

11. In a loom, the pattern and multiplier mechanisms, the feed-ratchets and cooperating feed-pawls therefor, the common actuator for said feed-pawls, a feed-disengaging device to disengage said feed-pawls and their ratchets, a lever for actuating said disengaging device, the lever-holding device and means to release it, the automatic stop mechanism to move said lever, a lever moved by the pattern-surface, a rod connecting said last-mentioned lever with and to move the lever for operating said disengaging device, the take-up roller, and means operated thereby to release said rod from engagement with said last-mentioned lever.

12. In a loom, the combination with the pattern and multiplier mechanisms, and the feed ratchets and pawls therefor, of means controlled by the pattern mechanism automatically to move said pawls out of engagement with said ratchets, a take-up roller, and means operated thereby automatically to move said pawls again into engagement with said ratchets.

13. In a box mechanism for looms, two alternately-acting feed devices and parts fed by the same, and means for disengaging the active feed device from the part fed thereby while insuring retention of the inactive feed device out of engagement with the part fed thereby.

14. In a loom containing a box mechanism, two alternately-acting box-mechanism feed devices and parts fed thereby, an automatic stop mechanism for the loom, and means controlled thereby for disengaging the active feed device from the part fed by it while insuring retention of the inactive feed device out of engagement with the part fed by it.

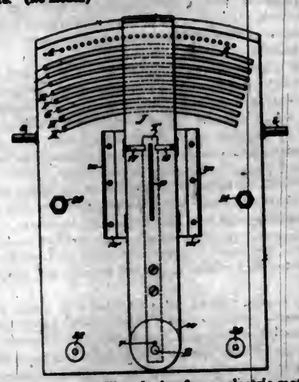


15. In a loom, containing a box mechanism, a plurality of box-mechanism feed devices, means to throw said feed devices temporarily out of action on stopping of the loom, and means to hold said feed devices out of action after the starting of the loom until such time as they can be again set in operation in the same order or sequence as when stopped, substantially as described.

16. In a loom, the combination with the pattern and multiplier mechanisms and the respective feed devices therefor, of means controlled by the pattern mechanism automatically to cause disengagement of both said feed devices from their respective mechanisms, a take-up roller and connections automatically to cause reengagement of said feed devices with their respective mechanisms at the end of a predetermined length of movement of said take-up roller, substantially as described.

17. In a loom, the combination of the pattern and multiplier mechanisms, feed devices therefor, disengaging means to cause said feed devices to be simultaneously disengaged from their respective mechanisms, and means controlled by the pattern-surface automatically to operate said disengaging means, substantially as described.

608,523. PLACKET-PROTECTOR AND SKIRT-SUPPORTER. WILLIAM H. CARR and JOHN G. WOLF, New York, N. Y. Filed Aug. 4, 1897. Serial No. 647,059. (No model.)



Claim.—1. A placket-protector and skirt-supporter, comprising two members pivoted together at their lower ends to overlie one another and having an interlocking engagement at their upper ends, and a hook adjustably secured to the upper end of one of the said members, substantially as described.

2. In a placket-protector and skirt-supporter, the combination, with pivotally-connected members, one of the members being provided with a keeper and the other with devices to enter said keeper, of a hook adjustably carried by said members and adapted for engagement with a bolt, for the purpose set forth.

3. In a placket-protector and skirt-supporter, the combination with two members pivoted together at their lower ends, one of the members being provided at its upper end with a keeper having key-hole-slots, and the other with pins to enter said slots, of a hook having a plurality of openings in its shank through which the said pins are adapted to project, substantially as herein shown and described.

608,524. ELECTRIC DENTAL-ENGINE CONTROLLER. JAMES J. CRAGHEAD, Rio Janeiro, Brazil. Filed Aug. 31, 1897. Serial No. 649,013. (No model.)

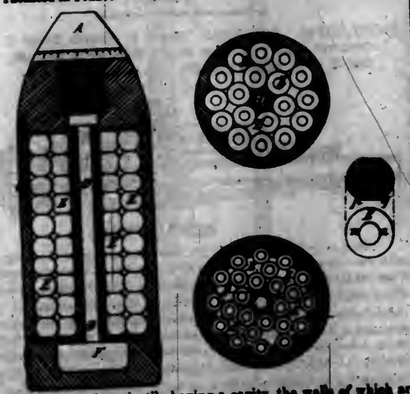
Claim.—1. A controlling device for an electric motor, comprising in connection with an electric circuit, a series of contact-strips, a pedal movable over the same and carrying contacts, a resistance-coil, a contact-point carried by the pedal for engaging with the resistance-coil, and a pole-changer electrically operated, substantially as specified.

2. A controller for an electric motor, comprising a base, a pedal mounted to swing on said base, a series of contact-plates on said base, contacts carried by the pedal for engaging with the plates, a resistance-coil secured to the base, a contact carried by the pedal for engaging with said resistance-coil, a spring carried by the pedal and in the electrical circuit, and contact-plates normally in engagement with said spring, substantially as specified.

3. In a controller for an electric motor, the combination with a base and contact devices thereon, of a pedal mounted to swing on the base and carrying contacts, a circuit-closer mounted on the pedal, and hinged wings carried by the pedal for shifting said circuit-closer, substantially as specified.

4. In a controller for an electric motor, the combination with an electric circuit and a resistance, of a controlling-pedal having a circuit-closer on its under side, and having its ends extended beyond the edges of the pedal, and wings hinged to the pedal and adapted to be operated to shift the circuit-closer, substantially as specified.

5. A controller for an electric current, comprising a base, a resistance on the under side thereof, a pedal mounted to swing on the base, a contact on said pedal for engaging with the resistance, pole-changing solenoids, and a pole-changing lever having connection with the core of the solenoids, substantially as specified.



6. A controller for an electric circuit, comprising in combination with a circuit, a base, a pedal mounted to swing on said base, a series of contact-plates on the base concentric with the pivotal point of the pedal, a resistance on said base, a lever mounted to swing relatively to the base, and push-pins extended through the base engaging with said lever at its opposite ends, and an electrically-operated pole-changer, substantially as specified.

7. A circuit-controller, comprising a base, a pedal mounted to swing thereon, a series of contact-strips on the base and concentric with the pivotal point of the pedal, contacts carried by the pedal for engaging with said contact-strips, a resistance-coil mounted on said base, a contact carried by the pedal for engaging with said resistance-coil, two solenoids in the circuit of the resistance-coil, a pole-changing lever, an arm extended from said pole-changing lever to a connection with the core of the solenoids, and a circuit-closer operated by said arm, substantially as specified.

8. A controller for an electric motor, comprising a base, a series of concentric contact-strips on said base, a pedal mounted to swing on the base, contacts carried by said pedal and engaging with the strips, a resistance on the base, means for connecting the resistance and pedal, a spring yielding contact-plate secured to the pedal and having engagement with the pivot of the pedal, said pivot being in the electrical circuit, and a rib on said spring-plate passing upward through an opening in the pedal, substantially as specified.

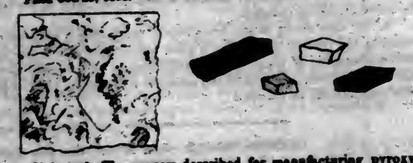
9. A controller for an electric motor, comprising a base, a pedal mounted to swing on said base, a series of concentric contact-strips on the base, contact-points carried by the pedal and engaging the said strips, a resistance having connection with a contact on the pedal, a spring yielding contact carried by the pedal and having connection with the pivot of the pedal, said pivot being in the electrical circuit, a pole-changing lever, solenoids for and operating said pole-changing lever, a circuit-closer operated by the movements of the pole-changing lever, and another circuit-closing lever having pins extended upward through the base, substantially as specified.

608,525. SHRAPNEL PROJECTILE. MESSRS. DARMANSENS, St. Chamond, France. Filed Nov. 5, 1897. Serial No. 657,514. (No model.) Patented in France Dec. 6, 1894. No. 242,427.

Claim.—1. A projectile having a cavity, the walls of which are provided with a series of longitudinally-extending grooves, and the projectile also having a central tube with longitudinally-extending grooves in its outer surface and with a disk at its inner end, each disk having its periphery serrated to match the grooves of the projectile.

2. A projectile having a cavity, the walls of which are provided with longitudinally-extending grooves, and a tube run centrally through the cavity and having longitudinally-extending grooves in its outer surface.

3. A projectile having a cavity, the walls of which are provided with longitudinally-extending grooves, a tube run centrally through the cavity and having longitudinally-extending grooves in its outer surface, and a series of balls contained within the cavity and arranged in rows lying in said grooves.



4. A projectile having a cavity, the walls of which are provided with longitudinally-extending grooves, a tube running centrally through the cavity and having grooves in its outer surface, the lower end of the tube having a disk with a serrated periphery conforming to the grooves in the walls of the cavity, and balls arranged within the cavity and lying in the said grooves.

5. A projectile, having a cavity, the walls of which are provided with longitudinally-extending grooves and a member run centrally through the cavity and held rigidly therein, said member having longitudinally-extending grooves formed in its outer surface, the grooves being adapted to contain balls stored within the cavity.

6. A projectile having a cavity formed therein, the cavity being provided with longitudinal grooves, a member held rigidly in the cavity and centrally with reference thereto, said member being provided with longitudinal grooves similar to those in the walls of the cavity, and a fuse-holder secured to one end of the projectile to close the cavity and engaging said centrally-disposed member, the cavity being adapted to contain a series of separate balls packed in the grooves.

7. A projectile having a cavity, a tube extending centrally through said cavity and provided with a disk at its lower end, the disk resting on the bottom of the cavity, and a fuse-holder secured to one end of the projectile to close the cavity and having connection with the tube, the cavity being adapted to receive balls packed therein and around the tube.

608,526. METHOD OF MANUFACTURING PYROXYLIN COMPOUNDS IN IMITATION OF MARBLE. JOSEPH B. FRANKE, New York, N. Y., assignor to the Arlington Manufacturing Company, same place. Filed Oct. 20, 1896. Serial No. 567,579. (No specimens.)

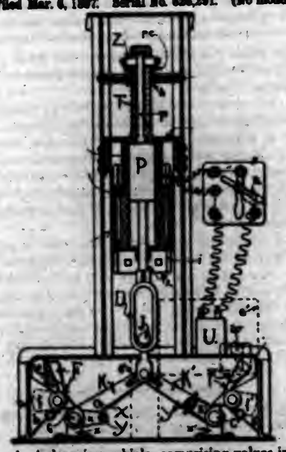
Claim.—1. The process described for manufacturing pyroxylin compounds in imitation of marble, said process consisting in forming pyroxylin compounds of suitable solid colors into fragments or pieces, dipping said pieces in a dye dissolved in a solvent of pyroxylin, and calendering the dipped fragments or pieces together to form sheeting, substantially as described.

2. The process described for manufacturing pyroxylin compounds in imitation of marble, said process consisting in producing pyroxylin compounds of different colors following the colors of the marble to be imitated, forming said compounds in fragments or pieces, dipping pieces of each solid color in a dye dissolved in a solvent of pyroxylin, calendering the whole number of pieces together to form a sheeting, compressing the sheeting into blocks and cutting the latter, substantially as described.

3. As a new article of manufacture a sheet of pyroxylin compound in imitation of marble consisting of fragments or pieces of pyroxylin compounds of one or more solid body colors following the colors of the marble to be imitated, said pieces having had applied to them an external coloring which when the pieces are blended together to form a sheet appear in irregular streaks and lines variously arranged and intermingled in the sheet and running through the body color or colors, substantially as described.

608,527. BOTTLE. WILLIAM A. FRIES, Sr., Brooklyn, N. Y. Filed May 21, 1897. Serial No. 637,081. (No model.)

Claim.—1. A bottle, having a channel in the interior of its neck, a valve-casing in the neck, a valve in the casing, and locking means for the casing comprising a plate substantially ovate in contour, the said plate being movable in an opening in the casing and adapted to engage in the channel of the neck and to engage its inner end against a wall of the opening, substantially as specified.



2. A bottle, having its neck portion provided with an interior annular shoulder and an interior annular channel, a valve-casing consisting of a lower tubular portion having a flange at its upper end and a valve-seat, an upper portion provided with outlet-ports and having legs, the lower ends of which are inclined outward and downward to engage against the bottom walls of inclined notches formed in the top of the flange of said tubular portion, a ball valve in the casing adapted to engage in the valve-seat, a cork bushing surrounding the tubular portion of the valve-casing, the said bushing being somewhat longer than said tubular portion and resting on a shoulder formed in the neck of the bottle, and locking means carried by the upper portion of the valve-casing and adapted to engage in the annular channel in the neck of the bottle, substantially as specified.

3. A bottle, having a neck portion provided with an interior channel, a glass-valve casing consisting of two detachable portions, the lower portion having a valve-seat, the upper portion having downwardly-extended legs to engage in notches formed in the upper end of said lower portion, the said upper portion having a space or chamber connected by means of ports between the legs with the opening through the lower portion of the valve-casing, and also communicating with the central opening or outlet through the head of the upper portion, and glass keys substantially ovate in contour and having lugs at their inner or larger ends, the said keys being movable in openings or seats formed in the head portion of the valve-casing, and adapted to engage in the channel formed in the neck of the bottle, substantially as specified.

4. A bottle, having its neck portion provided with an interior annular channel, a valve-casing in said neck portion having outlet-ports, a valve in said casing, and locking devices consisting of flat pieces of glass substantially ovate in contour and having lugs formed at the larger or inner end, the said locking devices being engaged in lateral openings extended from the central outlet of the valve-casing and movable into the annular channel formed in the neck of the bottle, substantially as specified.

5. An obstructing device for a bottle, comprising a glass-valve casing in the neck of the bottle, a glass valve therein, and locking devices consisting of glass, substantially ovate in contour, and movable to extend from openings in the casing to a channel in the bottle-neck substantially as specified.

603,528. DUMPING-VEHICLE. JOHN M. GOODWIN, New York, N. Y. Filed Mar. 6, 1897. Serial No. 626,291. (No model.)

Claim.—1. A dumping-vehicle, comprising valves in its bottom portion, a shaft upon which said valves are mounted to swing, struts on the lower sides of said valves, rotary shafts below the valves, detents on said shafts to engage with the struts and support the valves, levers loosely mounted on said shafts, means for locking the levers to the shafts, a vertically-movable piston, a cylinder in which the piston operates, and a connection between said piston and the levers, substantially as specified.

2. A dumping-vehicle, comprising valves in its bottom portion, the said valves being mounted to swing one independently of the other, shafts arranged below the valves, detents on said shafts, struts on the valves having rollers to engage with said detents, levers loosely mounted on the shafts, means for locking the levers to the shafts, means for locking the shafts from rotation, a cylinder, a piston operating in said cylinder, and a connection between the piston and levers, substantially as specified.

3. A mechanism for operating the valves of a dumping-vehicle, comprising a cylinder, a piston operating in said cylinder, a connection between said piston and devices for supporting the valves, a stem extended upward from the piston, an exteriorly-screw-threaded sleeve provided with opposite longitudinal slots, a collar movable on the sleeve and having connection with the stem, and a hand-wheel having an interiorly-threaded hub engaging with the thread of the sleeve, substantially as specified.

4. A dumping-vehicle having valves in its bottom, shafts extended longitudinally of the vehicle below the valves, struts on the valves, detents on the shafts for engaging with said struts, levers loosely mounted on the shafts, means for locking the levers to the shafts, pivoted dogs for locking the shafts from rotation, swinging doors on the casing in which said levers and dogs are located, lugs on the doors for holding the dogs in their locking position, and means for moving the levers vertically, substantially as specified.

5. A dumping-vehicle having swinging valves in its bottom, shafts arranged longitudinally of the vehicle below the valves, detents carried by the shafts, struts on the lower sides of the valves having rollers for engaging with said detents, levers mounted to swing on the shafts, lugs on the shafts, means for locking the lugs to the levers, and means for raising and lowering the levers, substantially as specified.

6. A dumping-vehicle having swinging valves in its bottom, struts on said valves, shafts extended longitudinally of the vehicle below the valves, detents on the shafts for engaging with the struts and supporting the valves, levers loosely mounted on the shafts, lugs rigidly secured to the shafts, means for locking the lugs to the levers, pivoted dogs for engaging with the lugs, and locking the shafts from rotation, and means for raising and lowering the levers, substantially as specified.

7. A dumping-vehicle having swinging valves in its bottom, struts on said valves, shafts extended longitudinally of the vehicle, detents on the shafts for engaging with the struts to support the valves, a cylinder, a piston operating in the cylinder, electrical connections whereby the piston may be operated in the cylinder, and connections between said piston and the shafts, whereby the valves may be lowered, substantially as specified.

8. In a dumping-vehicle, the combination with center valves, of swinging side valves, links movable in said side valves, hooks for engaging with said links, rollers on the hooks, and means for raising and lowering the hooks with the said side valves, substantially as specified.

9. In a dumping-vehicle, a valve mounted to swing in its lower portion, struts on the lower side of the said valve, a rotary shaft below the valve, detents on said shaft to engage with the struts and support the valve, a lever loosely mounted on the shaft, means for locking the lever to the shaft, and means for raising said lever to rock the shaft, substantially as specified.

603,529. ROCK-DRILL. HENRY B. HANCOCK, HENRY L. HANCOCK, and LIBERT G. HANCOCK, Mounts Mines, South Australia. Filed Sept. 2, 1897. Serial No. 650,201. (No model.)

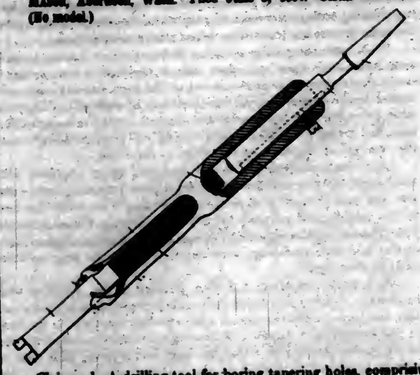
Claim.—1. In a rock-drill, the combination with a working cylinder provided with a cylindrical valve-chamber and passages leading from said valve-chamber to opposite ends of the working cylinder, of a hollow cylindrical valve working in said valve-chamber, said valve being provided with ports which register with the aforesaid passages, a fluid-supply opening leading into one end of the hollow valve, a double-headed piston in the working cylinder, and a spindle fixed to the hollow valve and depending into the working cylinder between the two piston-heads so as to be alternately acted upon by said heads, substantially as described.

2. In a drill or similar machine, the combination with a working cylinder provided with a cylindrical valve-chamber and passages leading from said valve-chamber to opposite ends of the working cylinder, an opening in the top of the said chamber, and a screw-cap for said opening, of a hollow cylindrical valve working in said valve-chamber, said valve being provided with ports which register with the aforesaid passages, and provided also with an opening A^7, in its top, a spindle F, tapped through an opening E^4, in the lower wall of the valve, a fluid-supply opening leading into one end of the hollow valve, and a piston in the working cylinder, said piston being arranged to operate the valve-spindle, substantially as described.

3. In a rock-drill, the combination with a cylindrical valve-chamber formed in the body of the machine and provided with oppositely-disposed side openings A^3, A^4, and a cap A^5, adapted to close either of said openings, of a hollow cylindrical valve having open ends registering with said side openings in the valve-chamber and provided also with passages which have communication with opposite ends of the working cylinder, a piston in the working cylinder, and a connection between said valve and piston, for the purpose specified.

4. In a rock-drill or similar machine, the combination with a working cylinder provided with a cylindrical valve-chamber and passages leading from said valve-chamber to opposite ends of the working cylinder, of a hollow cylindrical valve working in said chamber and provided with ports which register with the aforesaid passages, a fluid-supply opening leading into the hollow valve, a piston in the working cylinder, and exhaust-openings in the cylinder so disposed that the working fluid exhausts at either end of the stroke of the piston, substantially as described.

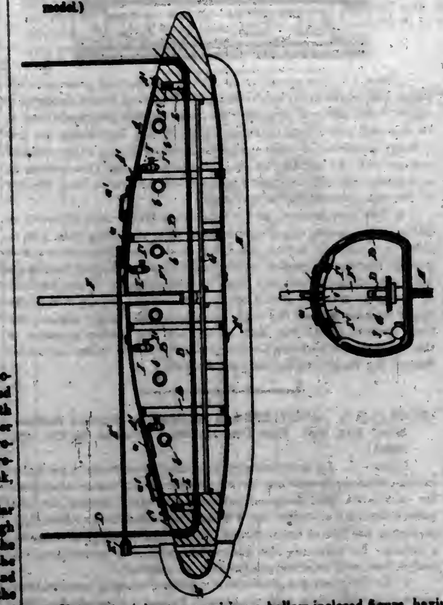
5. In a rock-drill or the like, the combination with a working cylinder provided with a cylindrical valve-chamber and passages leading from said valve-chamber to opposite ends of the working cylinder, of a hollow cylindrical valve working in said chamber, said valve being provided with ports which register with the aforesaid passages, a valve-operating spindle tapped into the hollow valve and depending into the working cylinder, a removable lining for the working cylinder, said lining being provided with openings I^2 I^3, at its opposite ends which register with the passages leading from the valve-chamber, and provided also with a slot I^1, for the valve-spindle, and a piston in the working cylinder, said piston being arranged to engage and operate the valve-spindle, substantially as described.



603,530. WRENCH. EDWIN HERWOOD, Hermansville, Mich. Filed July 7, 1897. Serial No. 643,701. (No model.)

Claim.—1. A wrench, comprising a fixed jaw having a plain rectangular shank, a sliding jaw loosely fitting upon the said shank and provided with a spur engaging the said shank, said spur serving both as a fulcrum and a gripping-surface for the jaw, and a grip-lever mounted in the sliding jaw in alinement with the said spur and provided with an angular head for engagement with said shank, whereby the sliding jaw will be first rocked and then locked to the shank, substantially as described.

2. A wrench, consisting of a fixed jaw having a plain rectangular shank, a sliding jaw provided with spaced strap extensions, through which the shank of the fixed jaw loosely extends, the portion of the jaw connecting the said strap extensions being provided within the rear strap extension with a spur, which serves both as a fulcrum and gripping-surface for said sliding jaw, and a grip-lever pivoted in the rear strap extension in alinement with the said spur and provided with an angular head forming a sharp contact-point for engagement with the shank of the fixed jaw, substantially as herein shown and described.



608,531. TOOL FOR BORING TAPERING HOLES. IRVING W. MASON, Aberdeen, Wash. Filed June 3, 1897. Serial No. 638,967. (No model.)

Claim.—1. A drilling-tool for boring tapering holes, comprising a tapering center or spindle adapted to be held in a fixed position and formed with a screw-rod, a bit having a body into which screws the said screw-rod, the said bit being also provided with flexible arms, and cutters held on the free ends of the said arms and engaging the tapering surface of the said spindle, substantially as shown and described.

2. A drilling-tool for boring tapering holes, comprising a tapering center or spindle adapted to be held in a fixed position and formed with a screw-rod, a bit having a body into which screws the said screw-rod, the said bit being also provided with flexible arms, cutters held on the free ends of the said arms and engaging the tapering surface of the said spindle, and a shank for the said body, and fitted to slide in the said body and adapted to engage the upper end of the said screw-rod, the said shank having connection with the said body for turning the latter, upon turning the shank, substantially as shown and described.

608,532. LIFE-BOAT. JAMES MITCHELL, Sr., Arrow River, Canada. Filed Apr. 24, 1897. Renewed Apr. 2, 1898. Serial No. 676,256. (No model.)

Claim.—1. A boat, comprising a hollow inclosed figure, having a rope-guiding passage through each end thereof, and a slide adapted to close said passage when the rope is removed therefrom, substantially as described.

2. A boat, comprising a hollow inclosed figure having pointed ends, and a rope-guiding passage through each end, and a slide having a spring acting thereon and adapted to close said passage when the rope is removed therefrom, substantially as described.

3. A boat, comprising a hollow inclosed figure having pointed ends, hatchways upon the upper side of the boat, a mast-socket in the boat, a rudder pivoted at one end of the boat, steering-ropes connected to the rudder, and a rope-guideway at each end of the boat communicating with the interior and adapted to receive a suspending-rope, and means for automatically closing said rope-guideways upon the removal of the rope, substantially as described.

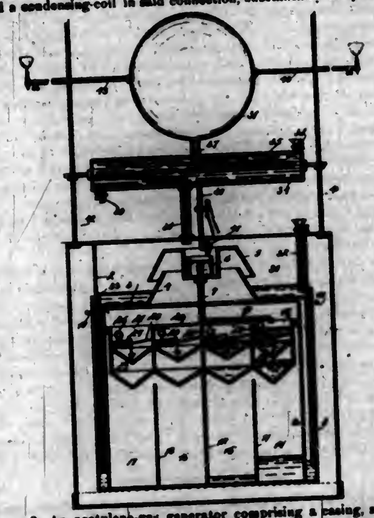
4. A boat, comprising a hollow inclosed figure, provided with hatchways, lighting port-holes, ventilator-pipes extending to the outside, and rope-guideways at each end extending from within the boat to the outside, and adapted to receive a common suspending-rope which passes lengthwise within the boat, and means for automatically closing said rope-guideways upon the removal of the rope, substantially as described.

5. A boat, comprising a hollow inclosed figure, provided with hatchways, lighting port-holes, ventilator-pipes extending to the outside, and rope-guideways at each end extending from within the boat to the outside, and adapted to receive a common suspending-rope which passes lengthwise within the boat, and a spring-held slide in said guideways adapted to close the guideway when the rope is removed, substantially as described.

608,533. PROCESS OF PRODUCING COPIES OF OIL-PAINTINGS. GIUSEPPE MORA, Milan, Italy. Filed Feb. 21, 1896. Serial No. 580,571. (No specimens.) Patented in Italy Aug. 8, 1896, No. 39,230, and in Germany Dec. 13, 1897, No. 96,154.

Claim.—The herein-described process of producing copies of oil-paintings, consisting in laying on the main or basal paints by means of stencils corresponding in number to the number of single paints in the original, whereby a rugged surface is obtained, then printing the surface paints on top of the said rugged base formed by the main or basal paints by means of a yielding printing-surface, and finishing the picture in the manner specified.

608,534. NUT-LOCK. CHARLES J. MCCUE, La Veta, Colo. Filed Aug. 4, 1897. Serial No. 647,095. (No model.)

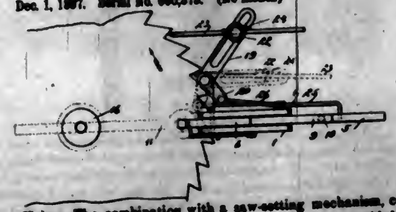


Claim.—1. The combination with a nut having grooves in opposite side edges at its inner face of a fastening device comprising upper, lower and end members, the upper member being provided at its free end with a head to engage with an end face of the nut and a flange projected at right angles to pass over the top of the nut and engage with the end face of the nut, the said flange thus serving as a fastening and also serving to indicate the member to be at the top of the nut, substantially as specified.

2. The combination, with a lock-nut provided with a groove or channel in opposing edges at its inner face, extending from side to side, of a locking device, consisting of an upper member, a lower parallel member of greater width, and an end-connecting member, a head extending downwardly from the inner portion of the free end of the upper member of said device, and a flange projected from the upper member beyond the head, being at a right angle thereto, the inner surfaces of the free ends of the top and bottom members of the fastening device being beveled, and likewise the under outer surface of the flange, for the purpose set forth.

608,535. ACETYLENE-GAS GENERATOR. WILLIAM MCGRAW, Mount Airy, Ohio. Filed June 28, 1897. Serial No. 642,279. (No model.)

Claim.—1. An acetylene-gas generator comprising a casing, a carbid-container therein and having a series of cells, water-cells above the carbid-cells and designed to discharge water therein, the said water-cells communicating one with another, means for automatically governing the flow of water through the bottom openings of the cells, a cylinder for receiving the generated gas, and a burner pipe extended from said receiver substantially as specified.



2. An acetylene-gas generator comprising a casing, a carbid-container supported from said casing and having a number of carbid-cells, water-cells supported in the container and adapted to overflow one into another, the said cells having funnel-shaped bottom walls provided with an outlet at the apex for discharging water into the carbid-cells, means for automatically closing said outlets, a gas-receiving cylinder, a pipe connection between said cylinder and the casing, and a condensing-coil in said connection, substantially as specified.

3. An acetylene-gas generator comprising a casing, a double-walled carbid-container, a wall suspended from the upper wall of the casing and extended between the walls of the container and supporting the same, carbid-cells in the container, water-cells supported in the container and having outlets for discharging water into the carbid-container, means for automatically closing said outlets, a horizontal partition at the upper portion of the supporting-wall, a trap-section in said partition another trap-section above the first-named trap-section, a water-cup supported by said other section, a pipe extended from the upper portion of said cup downward through its bottom and discharging into one of the water-cells, a condensing-box supported above the casing, a valve-controlled tube extended from said box through the top wall of the casing and having a trap-curve at its inner end discharging into the water-cup, a condensing-coil in the condensing-box and having communication with the interior of the casing, a gas-cylinder having communication with said condensing-coil, and a gas-burner pipe or pipes also having connection with said cylinder, substantially as specified.

4. An acetylene-gas generator, comprising a series of carbid-containers, water-cells above the containers and adapted to discharge therein means for automatically closing said discharge and connections between the cells whereby water may flow from one cell into another, substantially as specified.

608,536. SAW-SET. HENRY HEINGARDT, Brooklyn, N. Y. Filed Dec. 1, 1897. Serial No. 660,275. (No model.)

Claim.—The combination with a saw-setting mechanism, comprising a pressure-lever of a rock-shaft, an arm mounted on said shaft, a block adjustable on said arm, a rod adjustable through the block, a spring connection between the arm and block and connections between the rock-shaft and pressure-lever whereby the shaft will be rocked by a downward movement of the lever, substantially as specified.

608,537. FEED-MIXER. WALTER S. PEARSON, Newburyport, Mass. Filed July 17, 1897. Serial No. 644,947. (No model.)

Claim.—In a feed-mixer, the combination of a frame, a shaft revolubly mounted therein, a cylinder forming a chamber, the cylinder being mounted axially on the shaft so that its walls will be concentric thereto, a series of arms fixed to the shaft and located within the chamber, the arms being connected to the shaft at their middles so that each end of each arm will be in proximity with the inner sides of the said chamber, each end portion of each arm having its sides beveled in opposite directions so as to cause a portion of the material to be thrown by one side of the arm in one direction, and a second portion of the material to be thrown by the other side of the arm in an opposite direction, and a knife carried by each end of each arm, the knives lying flat against the inner sides of the chamber so as to scrape the feed therefrom.

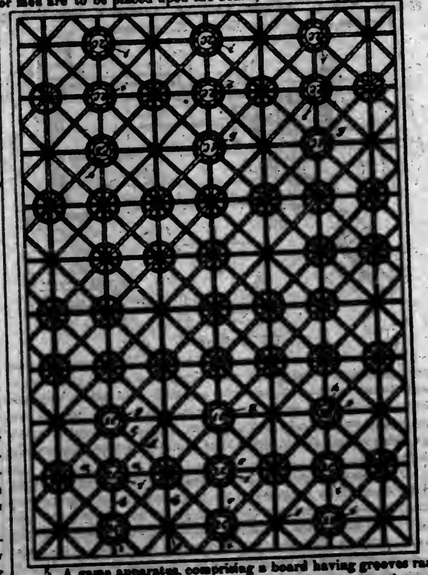
608,538. SWORD-SLINGING HOOK. JAMES PETTIGREW, Cincinnati, Ohio. Filed Oct. 11, 1897. Serial No. 654,804. (No model.)

Claim.—1. A sword-fastening device, consisting of an upper hook member A, provided with a central recess *c*, a lower hook member B, pivoted to the said upper member and having a guard extension D, which normally lies upon the under side of the hook portion of the upper member, said extension of the lower hook playing in the recess in the upper hook member, substantially as described.

2. A sword-fastening device, consisting of an upper hook member A, provided with a central recess *c*, and a strap-opening *e*, below said recess, a lower hook member B, pivoted to the said upper member and having an extension which lies in the recess *c*, in the upper member, and a guard D, at the end of said extension, which normally presses upon the under side of the hooked portion of the upper member.

3. A sword-fastening device consisting of the upper and lower hook members A, B, pivoted together by means of a pin supported upon the upper hook member, said lower hook member having an extension beyond the pivot-point lying within a recess in the upper hook member, and a spring connecting said upper and lower hook members and adapted to press the guard against the upper hook member, substantially as specified.

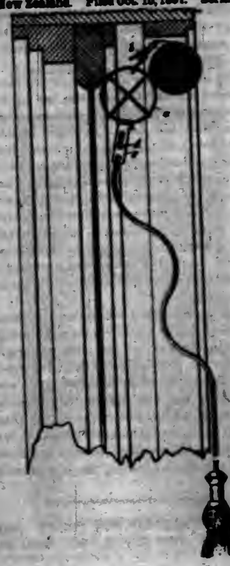
4. A sword-fastening device consisting of the upper hook member A provided with a recess *c*, a lower hook member B centrally pivoted to said upper member, the upper extension D of the lower hook member lying within said recess and provided with a pressure device adapted to strain the guard member D against the upper hook member, substantially as specified.



608,539. GAME APPARATUS. HENRY T. PYCROFT, Parnell, New Zealand. Filed Apr. 19, 1897. Serial No. 633,231. (No model.)

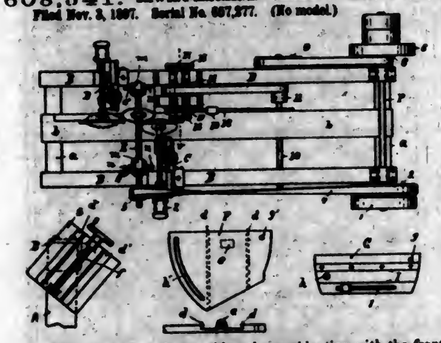
Claim.—1. A game-board having vertical and horizontal lines crossing each other at right angles forming squares, and diagonal lines crossing each other at right angles in the squares formed by the vertical and horizontal lines and at the points of intersection of the said vertical and horizontal lines, sundry of the points of intersection of the several lines having characters indicating the manner in which counters are to be placed upon the board, substantially as described.

2. A game-board having vertical and horizontal lines crossing each other at right angles forming squares, and diagonal lines crossing each other at right angles in the squares formed by the vertical and horizontal lines and at the points of intersection of said vertical and horizontal lines, circles being produced at sundry of the points of intersection of the several lines, and spots at other points of intersection of said lines, substantially as described.



3. A game-board having vertical, horizontal and diagonal lines intersecting each other, the diagonal lines crossing each other at right angles in the squares formed by the vertical and horizontal lines, marks having characters indicating the starting-points for the men or counters being produced on sundry of the points of intersection of the lines at each end of the board, and marks serving to regulate the movement of the men or counters being produced on other points of intersection of said lines, substantially as described.

4. A game-board having vertical and horizontal lines crossing each other at right angles forming squares, and diagonal lines crossing each other at right angles in the squares formed by the vertical and horizontal lines and at the points of intersection of said vertical and horizontal lines, circles being produced upon sundry of the points of intersection of the said lines, sundry of the circles at each end of the board having characters indicating the manner in which counters or men are to be placed upon the board, substantially as described.



5. A game apparatus, comprising a board having grooves ranging in vertical, horizontal and diagonal lines and intersecting each other, the diagonal grooves crossing each other at right angles, in the squares formed by the vertical and horizontal grooves, circular depressions being formed at the intersections of the said lines, and counters provided with projections on the under faces to fit in the said grooves, substantially as described.

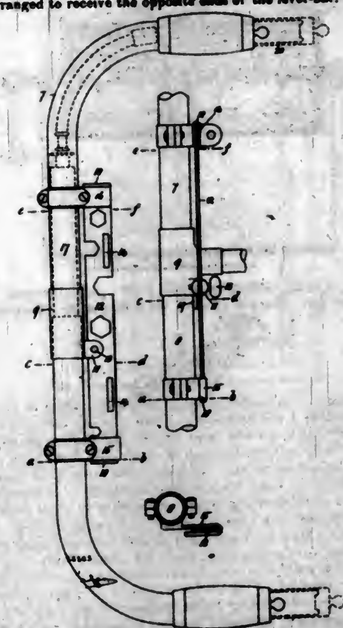
608,540. CURTAIN-TASSEL ATTACHMENT. HENRY T. PYCROFT, Auckland, New Zealand. Filed Oct. 15, 1897. Serial No. 655,201. (No model.)

Claim.—A shade attachment having a series of rings secured to each other to form a globular structure, a hook attached to one of the rings, and a plate bent over one of the rings at a point removed from the hook, the plate having two portions lying against each other, and said portions being perforated to receive a cord.

608,541. SAWING-MACHINE. CHARLES F. ROOD, Ford, Ky. Filed Nov. 3, 1897. Serial No. 657,277. (No model.)

Claim.—1. In a sawing-machine, the combination with the front and rear arbors C and D, and their saws arranged in planes at an angle to one another, of means for adjusting said arbors longitudinally, angularly and vertically, an intermediate arbor and its saw, and means for vertically and angularly adjusting said intermediate saw-arbor independently of the front and rear arbors, substantially as described.

2. In a sawing-machine, the combination with the machine-frame, of the fixed plates *c* secured to the frame and having straight, vertically-inclined ways, the ways of one plate converging toward the ways of the other plate, the plates F arranged to slide longitudinally in said ways, the plates G pivotally mounted at one end on the plates F, means for fastening the free ends of the plates G to the plates F, pillow-blocks arranged to move longitudinally in ways on the plates G and provided with journal-boxes, and saw-arbors journaled in said boxes and provided with saws, substantially as described.



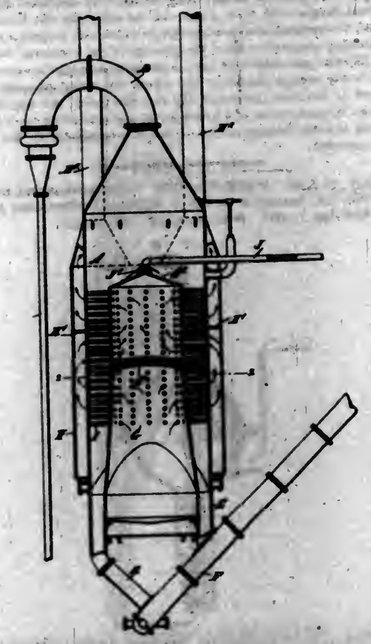
3. In a sawing-machine, the combination with the machine-frame, of the fixed plates *c* secured to the frame and having straight, vertically-inclined ways, the ways of one plate converging toward the ways of the other plate, the plates F arranged to slide longitudinally in said ways, means for adjusting the plates F in their ways, plates G pivotally attached to the plates F and provided with ways, means for adjusting the plates G about their pivots, pillow-blocks arranged to move longitudinally in the ways on the plates G and provided with journal-boxes, saw-arbors journaled in said boxes, saws mounted on the arbors, and means for adjusting the pillow-blocks in their ways, substantially as described.

4. In a sawing-machine, the combination with the machine-frame, of the fixed plates *c* secured to the frame and having straight, vertically-inclined ways, the ways of one plate converging toward the ways of the other plate, the plates F arranged to slide longitudinally in said ways and having threaded ears *e*, screws *f* journaled in bearings on the plates *c* and engaging said ears to adjust the plates F vertically, plates G pivotally attached to the plates F and having studs *h* arranged to travel in segmental slots *h'* in the plates F and hold the plates G in their adjusted positions, pillow-blocks arranged to slide longitudinally in ways on the plates G, adjusting-screws carried by the plates G and engaging ears carried by the pillow-blocks for adjusting the latter in their ways, saw-arbors journaled in bearings carried by the pillow-blocks, and saws mounted on the saw-arbors, substantially as described.

5. In a sawing-machine, the combination with the machine-frame, of the fixed plates *c* secured to the frame and having straight, vertically-inclined ways, the ways of one plate converging toward the ways of the other plate, the plates F arranged to slide longitudinally in said ways, the plates G pivotally mounted at one end on the plates F, means for fastening the free ends of the plates G, pillow-blocks arranged to move longitudinally in ways on the plates G and provided with journal-boxes, saw-arbors C D journaled in said boxes and provided with saws, an intermediate arbor E and its saw, and means for vertically and angularly adjusting the saw-arbor E, substantially as described.

608,542. HANDLE-BAR FOR CYCLES. JOHN F. SARSHAFF, Bracknell, England. Filed July 19, 1897. Serial No. 645,103. (No model.)

Claim.—1. In a handle-bar for cycles and like vehicles, the combination with the steering-head, of the divided handle-bar composed of two hollow sections, one of which is rigidly attached to the said steering-head, and the other telescoped therein so as to be detached therefrom, a clamp for securing said detachable handle-section to the steering-head, a screw for said clamp, a lever-bar pivoted intermediate its ends to the said screw and arranged when turned to operate the latter, and keepers or clamps carried by the handle-bar sections and arranged to receive the opposite ends of the lever-bar.



2. In a handle-bar for cycles and like vehicles, the combination with the steering-head, of a divided handle-bar composed of two hollow sections, one of which is rigidly attached to the steering-head, and the other detachably secured thereto, a clamp for securing the said detachable handle-section to the steering-head, and a lever-bar pivoted to the clamp and having its ends secured to the handle-bar sections to hold the latter in position, said lever-bar being provided with rectangular openings to serve as a wrench, and also provided with elongated strap-openings, substantially as described.

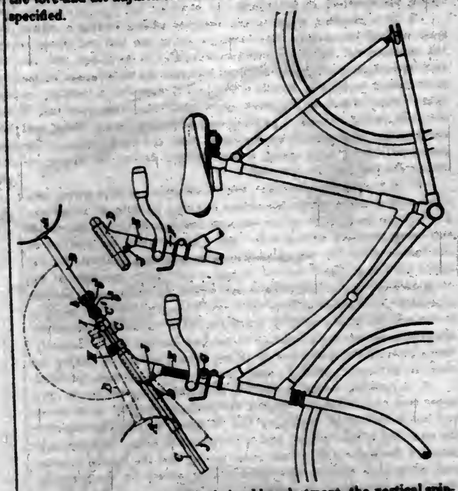
608,543. EVAPORATING APPARATUS. WALTER H. UNDERWOOD, Hutchinson, Kans. Filed July 9, 1897. Serial No. 644,068. (No model.)

Claim.—1. An evaporator for brine and the like, comprising three concentric chambers, the inner chamber constituting a fire-box and being closed at the top by a conical dome and having a partition across the same central its ends, the intermediate chamber constituting the evaporating or brine-containing chamber and extending above the fire-box, and the outer chamber constituting a smoke-flue or breeching and having a partition located above the partition in the fire-box and dividing the same into two parts, the fire-box and smoke-flue being connected above and below both partitions by horizontal flues curved in an S shape and extending through the evaporating-chamber, and a brine-supply pipe discharging upon the apex of the fire-box dome whereby the same is kept free of salt deposits, substantially as described.

2. An evaporator for brine and the like, comprising three concentric chambers, the inner chamber constituting a fire-box and being closed at the top, the central chamber constituting an evaporating or brine-containing chamber and extending above the fire-box, and the outer chamber constituting a smoke-flue or breeching, the fire-box and smoke-flue being connected by horizontal flues curved in an S shape and extending through the evaporating-chamber, substantially as described.

3. An evaporator for liquids containing salts in solution, comprising an evaporating or liquid-containing chamber having a fire-box within the same, the upper end of the fire-box being sloping, and a liquid-supply pipe having nozzles discharging the fresh brine upon and arranged to entirely cover the upper surface of the fire-box whereby the fire-box top is covered with fresh brine under circulation and the formation of salt deposits thereon is prevented.

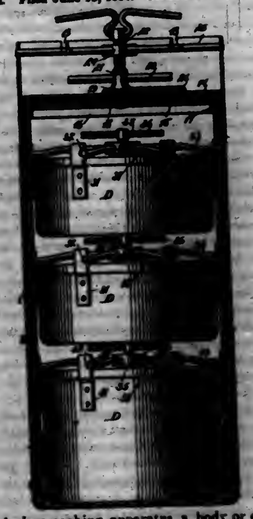
608,544. HOLDER FOR HATS, COATS, UMBRELLAS, &c. FRANK WAGENKLANE, New York, N. Y. Filed Oct. 1, 1897. Serial No. 653,733. (No model.)



Claim.—1. A holder for hats and the like, comprising a bar or plate having on its front face lugs at one end and a hook at the other end, a hat-ring provided with oppositely-projecting arms, one of which is hinged to the lugs of the bar or plate, the other arm being provided with an offset, and a lock for locking the offset arm of the ring to the hook of the bar or plate, substantially as described.

2. A holder for hats and the like, consisting of a bar or plate having on its front face lugs at one end and a hook at the other end, said hook being formed with a keeper, a hat-ring provided with oppositely-projecting arms, one of which is provided with an offset, the ring being hinged by means of the other arm to the lugs of the back, and a lock carried by the offset end of the arm of the ring and adapted to engage with its bolt the keeper of the hook, substantially as described.

608,545. BICYCLE OR TRICYCLE. WILLIAM F. WILLIAMS, London, England. Filed Dec. 7, 1896. Serial No. 614,770. (No model.) Patented in England June 12, 1896, No. 12,997.



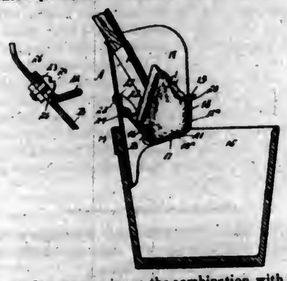
Claim.—1. In the herein-described shoulder-abutment, consisting of a shoulder-crutch-carrying fork jointed to an inclined fore-and-aft rod by a knee-joint so that it may fold and yet be supported rigidly in operative position, the rack-rod fitted to slide without turning in a socket, in combination with a self-locking adjusting-pinion mounted in a casing on said socket so as to gear with the rack but free to slide endwise in its journal-bearings and with a fixed clutch at one end adapted to be engaged by the pinion, and a spring at the other end adapted to force the pinion into engagement with the clutch and to permit its disengagement therefrom for the purpose of effecting the fore-and-aft adjustment of the inclined rack-rod, substantially as specified.

2. In the herein-described shoulder-abutment, the vertical spindle of the guide-socket for the inclined fore-and-aft rack-rod free to slide and turn in a socket in the handle-bar spindle and formed as a cylindrical rack, in combination with a self-locking adjusting-pinion mounted in a casing on the handle-bar spindle so as to gear with said cylindrical rack, the pinion being free to slide endwise in its journal-bearings and being combined with a fixed clutch at one end adapted to be engaged by the pinion, and with a spring at the other end adapted to force the pinion into engagement with the clutch and to permit of its disengagement therefrom for the purpose of effecting the vertical adjustment of the rack-rod, substantially as specified.

3. The combination with a bicycle, of a post thereon, a socket pivoted to the post, a rack sliding in the socket, a pinion mounted on the socket and engaging the rack, a forked frame having a knuckle-joint connection with the rack, and a shoulder-support attached to each arm of the forked frame.

608,546. DRY VACUUM-COOKER. HERMANN A. WOLFF, New Haven, Conn. Filed June 16, 1897. Serial No. 640,997. (No model.)

Claim.—1. In a cooking apparatus, a body or casing having a water-space around the same, a cover-casing open at one end and



closed at the opposite end, the said cover-casing being arranged to enter the water-space of the main casing to form a double water-jacket within the body or casing, and a locking device for the cover-casing, substantially as described.

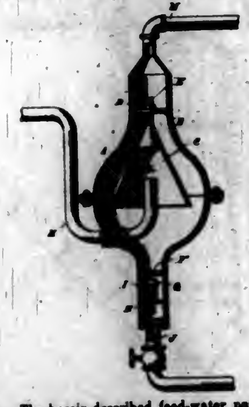
2. In a cooking apparatus, a body or casing having a water-space around the same, a cover-casing open at one end and closed at the opposite end, being provided with a valve in its closed end, the said cover-casing being also adapted to enter the water-space of the main casing to form a double water-jacket therefor, a packing located in the bottom of the water-space, with which the open end of the main casing engages, a packing carried by the closed end of said cover-casing, arranged for engagement with the upper edge of the inner wall of the main casing, and a locking device for the cover-casing, for the purpose specified.

3. In a cooking apparatus, the combination, with a casing provided with a surrounding water-space having a packing at its bottom, and a cover-casing open at one end and closed at the other, the closed end being provided with a valve and with packing, the packing at the closed end of the casing being arranged for engagement with the upper portion of the inner wall of said water-space, the sides of the cover-casing being arranged to extend within the water-space to form a double water-jacket and its open end to engage with the packing in the said space, of a locking device for the cover-casing, and vessels adapted to receive the articles to be cooked, located within the body-casing beneath the closed portion of the cover-casing, and locking devices for the covers of said vessels, as and for the purpose specified.

4. A cooking utensil, comprising an outer casing having an open upper end, and an interior spaced annular wall secured at its lower end to the bottom of the casing and its upper end terminating near the open end of the casing, and a cover-casing fitted telescopically between the inner wall of the outer casing and the spaced annular wall, whereby a double water-jacket is provided for the cooking-chamber, substantially as described.

608,547. MOP-WRINGER. HERMANN A. WOLFF, New Haven, Conn. Filed Sept. 23, 1897. Serial No. 652,764. (No model.)

Claim.—1. In a mop-wringer, the combination, with a body portion open at the front and provided with supporting-ledges, of a perforated mop-receptacle arranged to have bearing upon said ledges, and a stop carried by the mop-receptacle, which stop extends over the bottom of the said receptacle, and is adapted for engagement with a mop-head, for the purpose set forth.



2. In a mop-wringer, the combination, with a body comprising a back and side wings, of a perforated mop-receptacle, means for securing the said receptacle in the said body between its wings, and a stop attached to the back portion of the mop-receptacle, the stop being of angular formation, one of its members extending in direction of the bottom of the mop-receptacle, for the purpose specified.

3. In a mop-wringer, the combination, with a body comprising a back section and wing-sections, the wing-sections being provided with horizontal bottom flanges and vertical flanges at the front, of a perforated mop-receptacle arranged for locking engagement with the flanges of the wings, the mop-receptacle comprising a back forwardly and downwardly inclined, a bottom portion and a front portion, the bottom and front portions of the mop-receptacle being provided with means for locking engagement with the said flanges of the wings, and a stop secured to the back portion of the mop, a member of the stop extending over the bottom portion of the said mop-receptacle, for the purpose specified.

4. In a mop-wringer, the combination, with a body comprising a back and side wings, the back portion being provided with clamps for engagement with a vessel, of a mop-receptacle provided with perforations, and comprising an inclined back, a slightly inclined bottom and an inclined front, a locking engagement between the mop-receptacle and the said body, and a stop attached to the body, a member of the said stop extending forwardly over the bottom portion of the said mop-receptacle, for the purpose specified.

5. In a mop-wringer, the combination, with a body comprising a back and side wings, horizontal flanges secured to the bottom portions of the wings of the body, and vertical flanges attached to the vertical edges of the said wings, connecting with the horizontal flanges, the horizontal flanges being formed with apertures and the vertical flanges with slots, and means for attaching the body to a vessel, of a perforated mop-receptacle provided with projections from its bottom, arranged to enter the openings in the horizontal flanges, and likewise provided with lugs at its front, arranged to enter the slots in the vertical flanges of the wings, and a stop adjustably attached to the back portion of the mop-receptacle, the stop being angular in cross-section and a member of said stop being carried forwardly over the bottom portion of the mop-receptacle, for the purpose specified.

608,548. WATER-PURIFIER. CLARENCE APPLEGATE, Evansville, Ind., assignor of one-half to McDonald Brothers, same place. Filed Aug. 11, 1897. Serial No. 647,866. (No model.)

Claim.—The herein-described feed-water purifier, consisting of the chamber, A, provided with a cross-bar, B, near its upper end, the inverted cone, C, adjustably suspended from said cross-bar, the inlet-pipe from a water-supply under pressure entering the chamber, A, below the cone, bent upward and discharged at L at about the middle of the cone, a discharge-pipe leading from the top of the chamber to the boiler, the diaphragm, F, below the cone, perforated to form a valve-seat, the upward-closing spring-valve, G, normally engaging said seat, and the sediment-discharge pipe, J, leading from the bottom of the chamber, substantially as described.

608,549. AIR-GUN. ELMER E. BAILEY and THOMAS A. MOHR, Philadelphia, Pa. Filed June 29, 1897. Serial No. 642,927. (No model.)

Claim.—1. In an air-gun, the combination with the magazine, having an apertured disk at its front end, and the lock-frame having a socket in its front extension, of the firing-tube having its front end held in said disk and provided with an enlarged head which fits in said socket, substantially as shown and described, for the purpose specified.

2. In an air-gun, the firing-tube having a head made of suitably-hardened material and constructed with a circumferential interior shoulder, or rib, which is of less diameter than the firing-tube, substantially as and for the purpose specified.

3. In an air-gun, the firing-tube having a hardened or steel head whose longitudinal passage is tapered as shown, there being an angular shoulder formed at the inner end of each passage, which shoulder abuts the firing-tube and is of less diameter than the latter, as and for the purpose specified.

4. In an air-gun, the combination with the magazine and firing-tube, having a head provided with a tapered passage as specified, of the air-jet tube, the piston attached to the latter, piston-rod, air-cylinder, and means for reciprocating the piston, as shown and described.

5. In an air-gun, the combination, with the air-jet tube and piston-rod, each threaded as specified, of the head for each tube, having alined and threaded bores, and air-passages opening at the front as shown and described.

6. In an air-gun, the air-jet having an enlarged head provided with lateral passages opening on the front side and the soft-metal piston proper cast on and around said head, as shown and described.

7. In an air-gun, the combination with the lock-frame, having the flexible hook as specified, the fixed air-compression cylinder, the piston sliding therein, the piston-rod, and link, of the pivoted guard-lever having a hook on its shorter arm, and the spiral spring attached to the hooks, as shown and described for the purpose specified.

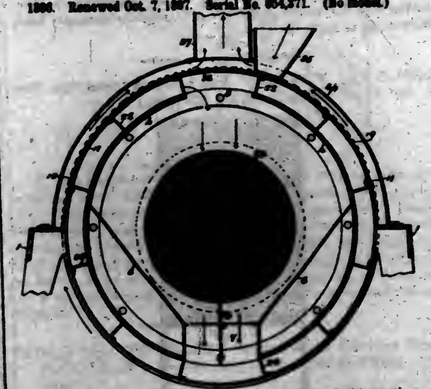
6. In an air-gun, the combination with the lock-frame having a tapered guide-passage formed by opposing longitudinal projections on one side of said frame as specified, of the piston-rod having its rear end tapered, or conical, to adapt it to enter and be guided in said passage, as shown and described.

9. In an air-gun, the combination, with the piston-rod and sear, of the pivoted trigger having a curved lug or arm, which passes through said sear, and the spiral spring engaging said lug, as shown and described.

10. In an air-gun, the combination with the lock-frame made in two longitudinal parts, the piston-rod and sear, of the trigger, connected with said sear, and a screw which passes through the trigger and lock-frame and thus serves to pivot the one and secure the parts of the other together, as shown and described.

11. In an air-gun, the lock-frame formed of two longitudinal parts, one having a lateral apertured lug on its front extension, and the other extension having a corresponding recess to receive said lug, the magazine fitting on the cylindrical extension, and a screw passing through the magazine and lug, for securing the parts together, as shown and described.

12. In an air-gun, the combination with the lock-frame having a front extension, and apertured lug, the magazine fitting on said extension and having a shot-hole, a slidable sleeve on said magazine, and a round-headed screw passing through one of the holes in the magazine and entering the lug on the lock-frame, whereby it serves to unite the magazine and frame and also as a stop for the sleeve, as shown and described.



608,550. HANDLE FOR HOES, RAKES, &c. ALBERT L. BOYER, Otis, Ind. Filed Sept. 27, 1897. Serial No. 653,253. (No model.)

Claim.—1. In a handle for hoes, rakes, &c., a pin located at the end of the handle, an eye formed at the end of said pin, a washer located on the pin, a nut located on the pin behind the washer, said washer having on its outer face horizontal recesses adapted to receive the sides of the eye and perpendicular recesses, the hoe or rake having a shank adapted to pass through said eye, the perpendicular recesses of the washer adapted to come in contact with said shank and impinge the shank in the eye.

2. In a handle for hoes, rakes, &c., a pin fixed to the end of the handle, an eye located at the end of the pin, said pin being externally threaded, a washer located on the pin, a nut located on the pin behind the washer, said washer having in its outer face horizontal recesses adapted to receive the sides of the eye and perpendicular recesses, the hoe or rake having a curved shank, said shank adapted to pass through said eye, the recesses of the washer adapted to receive said shank and impinge the shank in the eye.

608,551. COFFEE-ROASTER. GEORGE BUSH, St. Louis, Mo., assignor of one-third to Frank W. Gibson, same place. Filed July 28, 1896. Renewed Oct. 7, 1897. Serial No. 654,371. (No model.)

Claim.—1. In a coffee-roasting apparatus, a suitable stationary roaster adapted to receive the products of combustion from a suitable heater, means for delivering the coffee into the roaster and causing the same to pass through the products of combustion as they pass through the roaster, and subsequently carrying the coffee over the roasting-surface of the roaster, substantially as set forth.

2. In a coffee-roasting apparatus, a stationary roaster adapted to receive the products of combustion from a suitable heater, a drum surrounding the roaster, means forming a part of the drum for carrying the coffee about the outer roasting-surface of the roaster, and for causing the coffee to subsequently pass through the roaster and through the products of combustion passing through the same, substantially as set forth.

3. In a coffee-roasting apparatus, a suitable stationary roasting-cylinder having an opening cut at the top of its peripheral walls, a discharge-opening opposite said first-named opening, a suitable opening formed at one end of the cylinder for the admission of products of combustion from a suitable heater, a revolving drum surrounding the roaster-cylinder, a sufficient space being left between the peripheral walls of the cylinder and the drum, a series of division-plates formed along the inner peripheral surface of the drum and extending across the space between the drum and cylinder, means for rotating the drum, and means for introducing the coffee into the cylinder, the parts operating substantially as and for the purpose set forth.

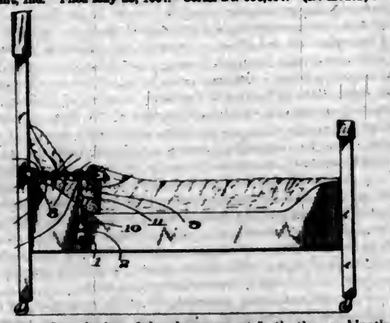
4. In a roasting apparatus, a suitable roaster having a stationary head, a funnel carried along the inner surface of the head, a discharge-opening at the base of the funnel leading to the outside of the head, a second funnel disposed under said discharge-opening on the outside of the head, and a discharge-opening at the base of said second funnel leading to the inside of the roaster, the whole serving as a "sampler" for the berry, substantially as set forth.

5. In a coffee-roasting apparatus, a suitable roaster having a discharge-opening for the coffee, a heater for the roaster, a valve controlling said opening, a drum adapted to revolve about the roaster, said drum having a slide or valve in the peripheral wall thereof, and adapted to be brought in alinement with the discharge-opening of the roaster, and means forming a part of the drum for carrying the coffee about the outer roasting surface of the roaster, substantially as set forth.

6. In a coffee-roasting apparatus, a suitable roaster adapted to receive products of combustion from a suitable heater, and means for delivering the coffee into the roaster and causing the same to pass through the products of combustion as they pass through the roaster, and subsequently carrying the coffee over a roasting-surface heated from any suitable source, but keeping the said coffee out of contact with the combustion products, substantially as set forth.

7. In a coffee-roasting apparatus, a suitable roaster adapted to receive products of combustion from a suitable heater, a stationary head forming a part of said roaster, means for delivering the coffee into the roaster and causing the same to pass through the products of combustion as they pass through the roaster, and subsequently carrying the coffee over the roasting-surface of the roaster, and an exhaust-pipe communicating with the interior of the roaster through the stationary head, substantially as set forth.

8. In a coffee-roasting apparatus, a stationary roaster adapted to receive products of combustion from a suitable heater, a stationary head forming a part of the roaster, a drum surrounding the roaster, means forming a part of the drum for carrying the coffee about the outer roasting-surface of the roaster, and for causing the coffee to subsequently pass through the roaster and through the products of combustion passing through the same, and an exhaust-pipe communicating with the interior of the roaster through the stationary head, substantially as set forth.



608,552. WASHBOARD. JAMES R. CLAYTON, London, Ohio. Filed Sept. 23, 1897. Serial No. 652,700. (No model.)

Claim.—1. The combination in a washboard of a base-plate, with a series of central wires, sloping downward from their inner ends and a series of curved outer wires having their inner ends set lower than their opposite ends, all arranged in the manner described for the purpose set forth.

2. As a new article of manufacture the within-described washboard consisting essentially of a base-plate A, backing B, side pieces *b*, *b*, central wires *c*, *c*, sloping downward from their inner ends, and outer curved wires *g*, *g*, all arranged as described and for the purpose set forth.

603,553. BEDCLOTHES-HOLDER. IRVING D. CRIMSON, Crown Point, Ind. Filed May 25, 1897. Serial No. 638,057. (No model.)

Claim.—In a device of the character set forth, the combination of securing devices adapted to be attached to the headboard and side rails of a bed, a yielding member including a spring having a ring attached thereto, a clasp attached to the opposite side of the ring, and a vertically-adjustable retaining-strap having its upper end secured to the ring and its lower end movably connected to the securing device for attachment to the adjacent side rail of the bed.

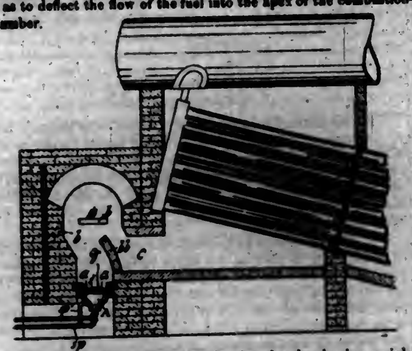
608,554. STRAINER AND FILTER FOR CONDUCTOR-PIPES. ELLIS CULVER, Huntington, Ind. Filed June 9, 1897. Serial No. 640,044. (No model.)

Claim.—1. The combination with a conductor-pipe of a filtering-chamber, consisting of a pipe-section having an opening in one side thereof, and a deflector adapted to close over the said opening, a bracket mounted in the lower portion of said chamber and having a loop therein, and a conical strainer removably positioned in said chamber and having its lower reduced end engaging the loop of the bracket, substantially as and for the purposes specified.

2. The combination with the conductor-pipe of a filtering-chamber, consisting of a cylindrical section having an opening in one side thereof with a deflector adapted to close thereover, an upper inwardly-extending flange, a lower bracket with a loop therein, and a conical strainer movably retained in position between the said flange and the bracket and having the lower reduced end thereof seated in the said loop, substantially as and for the purposes specified.

3. The combination with the conductor-pipe of a filtering-chamber, consisting of a cylindrical section having an opening in one side with a deflector closing thereover, a bracket comprising a loop and having arms extending outwardly therefrom in lateral directions and forming pivots for the said deflector, and a conical strainer removably supported by the said bracket and having its lower reduced end removably mounted in the said loop, substantially as and for the purposes specified.

608,555. WHISTLE. ABRAM B. DAVIS, Jersey City, N. J. Filed July 14, 1897. Serial No. 644,669. (No model.)



Claim.—1. In a whistle, the combination with a barrel having a vent and a mouth at one end and its other end provided with a gage-opening, of a piston movable in said barrel, a piston-rod movable through the apertured end, and a gage connected to the piston and having a portion adapted to abut against the end of the barrel and another portion adapted to be loosely received in the opening in said end.

2. In a whistle, the combination with a barrel having a vent and a mouth at one end and its other end provided with a gage-opening, of a piston movable in said barrel, a piston-rod having a knob at its outer end which is adapted to abut on the end of the barrel when the piston is pushed in sufficiently, and a gage pivoted to the knob and having a portion projecting therefrom toward the apertured end and adapted to abut thereon, and a free end projecting beyond said portion and adapted for loose reception in the aperture.

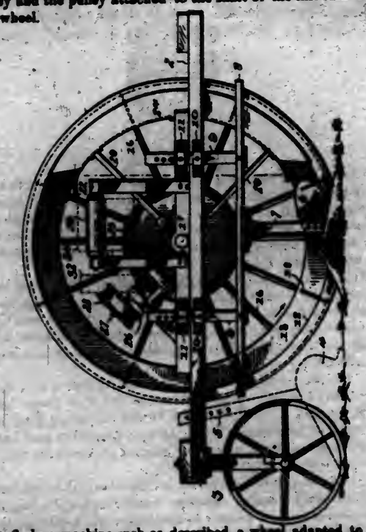
3. In a whistle, the combination with a barrel provided with a vent and mouth at one end, and a cap at the other end having a key-hole-slot, of a piston movable in the barrel, a piston-rod working through the head of the keyhole-slot and having a knob on its outer end, and a gage consisting of a piece of wire having its ends pivoted to the sides of the knob and its intermediate portion bent into members that project beyond the knob toward the end of the barrel and on opposite sides of the piston-rod being adapted to tightly straddle the same, and bent into an abutment adapted to strike the cap, and a guide projecting beyond the abutment and adapted to loosely fit the straight part of the keyhole-slot.

608,556. FURNACE AND LIQUID-FUEL BURNER. OTTO W. DEBES, New York, N. Y. Filed Mar. 5, 1897. Serial No. 626,074. (No model.)

Claim.—1. A furnace comprising a combustion-chamber having an inlet for fluid fuel in its bottom, an outlet connecting the combustion-chamber with the apparatus where the heat is to be applied and a bridge-wall partly closing the outlet and extending over the inlet so as to deflect the flow of the fuel into the apex of the combustion-chamber.

2. A furnace comprising a combustion-chamber having an inlet for fluid fuel in its bottom, an outlet connecting the combustion-chamber with the apparatus where the heat is to be applied, air-flues arranged to produce a current having rotary motion in the upper part of the combustion-chamber, and a bridge-wall partly closing the outlet and extending over the inlet so as to deflect the flow of the fuel into the apex of the combustion-chamber.

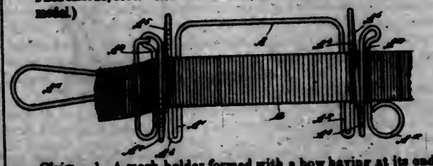
3. An apparatus for producing fluid fuel from crude oils, comprising a main supply-pipe provided with perforations near its outlet, a shallow pan set upon the outlet, branch pipes communicating with the perforations of the main supply-pipe, shallow pans set upon their outlets, steam-coil located underneath the pans, means for conveying crude oil into the apparatus, means for heating and means for disintegrating them.



4. An apparatus for producing fluid fuel from crude oils, comprising a main oil-supply pipe provided with perforations near its outlet, a shallow pan set upon the outlet, a steam-pipe set within the main oil-supply pipe, a nozzle, set on the steam-supply pipe, and discharging into the oil-supply pipe underneath the perforations, branch oil-pipes communicating with the perforations of the main oil-supply pipe, shallow pans set upon their outlets, steam-coil located underneath the pans, and nozzles set in the steam-coil and discharging into the throats of the branch supply-pipes.

5. An apparatus for producing and diffusing fluid fuel from crude oils, comprising a main oil-supply pipe provided with perforations near its outlet, a shallow pan set upon the outlet, a steam-pipe set within the main oil-supply pipe, a nozzle, set on the steam-supply pipe and discharging into the oil-supply pipe underneath the perforations, branch oil-pipes communicating with the perforations of the main oil-supply pipe, shallow pans set upon their outlets steam-coil located underneath the pans, and nozzles set in the steam-coil and discharging into the throats of the branch supply-pipes, a bearing supported by webs in the mouth of the main oil-supply pipe, a shaft rotating in the bearing, a propeller and a fan secured to the shaft, and air-flues arranged around the pans.

6. A furnace comprising the combination with a combustion-chamber having an inlet for fluid fuel in its bottom, of an apparatus for producing and diffusing of fluid fuel from crude oils, comprising a main oil-supply pipe provided with perforations near its outlet, a shallow pan set upon the outlet, a steam-pipe set within the main oil-supply pipe, a nozzle, set on the steam-supply pipe and discharging into the oil-supply pipe underneath the perforations, branch oil-pipes communicating with the perforations of the main oil-supply pipe, shallow pans set upon their outlets, steam-coil located underneath the pans, and nozzles set in the steam-coil and discharging into the throats of the branch supply-pipes, a bearing supported by webs in the mouth of the main oil-supply pipe, a shaft rotating in the bearing, a propeller and a fan secured to the shaft, air-flues surrounding the apparatus and a screen set above the fan and separating the combustion-chamber from the apparatus.



608,557. DITCHING-MACHINE. JOHN G. DELLAHAY, Austin, Tex., assignor of one-half to Charles G. Lund and George W. Thompson, same place. Filed June 16, 1897. Serial No. 641,594. (No model.)

Claim.—1. In a machine such as described, a wheel adapted to elevate earth, a beveled gear attached to said wheel, a beveled gear attached to a shaft journaled in the framework of the machine, said beveled gears meshing with each other, a pulley attached to the shaft of the last said beveled gear, a pulley located within the wheel, a pulley located to one side of the wheel, a conveying-belt surrounding the last said pulleys, a pulley attached to the last said outer pulley, and a belt surrounding the pulley attached to the conveying-belt pulley and the pulley attached to the shaft of the last said beveled cog-wheel.

2. In a machine such as described, a wheel adapted to elevate earth, said wheel having on the inner side of its rim suitable elevators, a short flange located at one edge of the wheel-rim, a longer flange located at the opposite edge of the wheel-rim, a guide adapted to coact with the wheel-rim in elevating the earth, said guide having at one edge a flange terminating in the vicinity of the edge of the shorter flange of the wheel-rim, said guide having at its upper and lower ends inwardly-bent sections adapted to press and deliver the earth.

608,558. WORK-HOLDER. CARLY D. HARRIS, Worcester, Mass. Filed Mar. 22, 1897. Renewed Mar. 30, 1898. Serial No. 676,630. (No model.)

Claim.—1. A work-holder formed with a bow having at its ends spring clamping devices each consisting of side bars and an adjacent spring by which the material to be held is clamped to said side bars, substantially as described.

2. A work-holder comprising the bow and the clamping devices at the ends thereof bent in the form of loops extended laterally to the direction of the length of the bow, substantially as described.

3. A work-holder, comprising a bow, and clamping devices depending from the ends thereof and composed of spring-loops forming clamps which are arranged practically at right angles to the bow, and are open at their bent lower ends to permit convenient insertion and removal of the work held stretched parallel to the bow proper, as shown and described

4. The work-holder herein described formed of a length of wire bent at one end to form a handle, bent adjacent to said handle to form a clamp device, extended from said handle to form a bow and bent at the opposite ends of said bow to form clamping devices, substantially as described.

5. A work-holder composed of a bow and clamps arranged practically at right angles to such bow and composed of inner bars, clamping-bars arranged exterior to such inner ones, and a third portion A^5, A^6, arranged adjacent to, but in the rear of, the aforesaid inner and clamping bars, as shown and described, whereby the work is drawn around parts A^5, A^6, and passes between the other adjacent parts, for clamping and stretching it, as specified.

6. A work-holder comprising a bow and clamps at the ends thereof comprising bars between which the work is passed and returned and a bar around which the work is passed between said first bars whereby the latter will be spread apart to release the work when longitudinal stress is exerted on the said work substantially as described.

608,559. SAFETY-SEAL FOR BOTTLES. AMY L. BLISS, Aspen, Colo. Filed May 28, 1897. Serial No. 638,604. (No model.)

Claim.—1. In a non-refillable bottle, the combination with a neck having two diametrically-disposed openings therein, with seats surrounding the same, of a wire adapted to pass through said openings, and having one end formed of separable parts adapted to be upset, and a seal to receive and cover the upset parts of said wire, substantially as described.

2. In a non-refillable bottle, the combination with a neck having diametrically-disposed openings therethrough, of a flange formed around the said neck, a frangible portion formed below said flange, seats surrounding said openings, a headed split pin adapted to pass through said openings, and means for securing said pin in said openings, substantially as described.

3. In a non-refillable bottle, the combination with a neck having diametrically-disposed openings therethrough, of a flange formed around said neck, a frangible portion formed below said flange, seats surrounding said openings, a headed split pin adapted to pass through said openings, and a soft-metal seal adapted to secure the split end of said pin, substantially as described.

4. In a non-refillable bottle, the combination with a neck having two diametrically-disposed openings therethrough and a breaking-groove thereround, of a flange formed above said breaking-groove, seats formed around said openings, a pin provided with a split end adapted to pass through said openings, a head formed upon said pin provided with an extended strip having an opening near the end thereof, and a seal comprising two similar portions one of which has a central opening adapted to fit the split end of said pin, substantially as described.

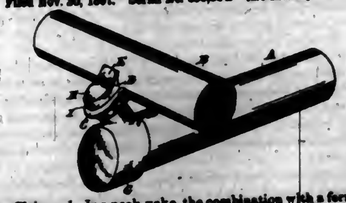
608,560. MEAT-HOLDER. JAMES H. FIRTH and JOSEPH T. FIRTH, Newburg, N. Y. Filed Dec. 14, 1897. Serial No. 661,881. (No model.)

Claim.—1. In a meat-holder, the combination of the base provided with slots arranged in parallel lines and having enlargements, of movable jaws adapted to slide in said slots and to be held by said enlargements, a movable jaw provided with teeth and arranged opposite to the previously-mentioned jaws, and a screw provided with a handle arranged to engage the lower part of said movable jaw, substantially as described.

2. In a meat-holder, the combination with a base A, provided with elongated, parallel slots *a* having enlargements *a'*, jaws B adapted to slide in said slots and to be held in said enlargements, the bases of said jaws being provided with transverse ribs at the end running the whole width of the base, and a longitudinal central rib, a movable jaw arranged opposite to the jaws B, and means for moving said jaw, substantially as described.

3. In a meat-holder, the combination of the base provided with parallel slots having enlargements, movable jaws adapted to slide in said slots and to be held in said enlargements, a movable jaw arranged opposite to the previously-mentioned jaws, said jaw being provided with a perforated extension, a screw provided with a handle passing said extension, and a piece of boot metal engaging said extension and said screw, substantially as described.

608,561. SIDEWALK-CURB AND CULVERT-COVER. GEORGE P. GREEN, Rockaway Beach, N. Y. Filed May 27, 1897. Serial No. 638,269. (No model.)



Claim.—1. A combined sidewalk-curb and culvert-cover, comprising a flanged manhole-frame, having the flange on one side separated from the flanges of the adjoining sides, and provided with dowel-pins projecting therefrom, a cover fitted between the connected flanges and provided with dowel-pins on its disengaged edge; and a hollow curb-piece provided with holes in position to receive the dowel-pins of the separated flange of the frame and of the cover, and with lugs for securing to it the curbstones on both ends thereof.

2. The combination of frame *a*, provided with flanges *b*, *d* and *f*; dowel-pins *r*, integral with flange *f* with hollow curb-piece *g*, set upon the frame provided with holes in corresponding positions to engage dowel-pins *r*, and cover *c*, fitted between the flanges and provided with dowel-pins *g* in position to enter corresponding holes in the curb-piece, thereby locking the cover and the curb-piece in position and with the frame.

3. The combination with a manhole-frame having flanges adapted to hold a cover in position, one flange being provided with dowel-pins; and with a cover, snugly fitted upon the flanges of the frame and having one edge provided with dowel-pins, of a removable curb-piece, fitted between the edge of the cover and the opposite flange of the frame and provided with holes in position to receive the dowel-pins projecting from the flange and from the edge of the cover.

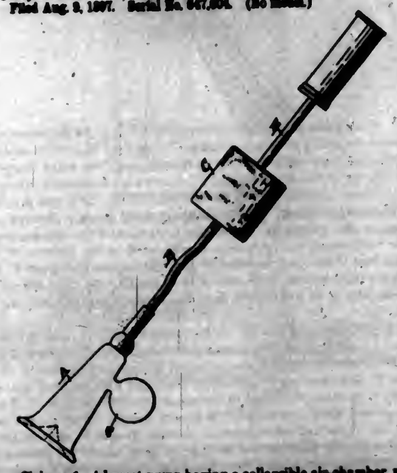
608,562. NECK-YOKE. WILLIAM H. HARDY, McMinnville, Oreg. Filed Nov. 20, 1897. Serial No. 659,504. (No model.)

Claim.—1. In a neck-yoke, the combination with a ferrule adapted to be fitted to the end of the pole, a forwardly-extending head formed integral with said ferrule, a reduced neck for said head, a two-part bushing adapted to embrace the said neck, grooves formed in the outer surface of the said bushing and a staple adapted to embrace grooves in the bushing, and pass through the yoke, substantially as set forth.

2. In a neck-yoke, the combination with a ferrule adapted to be fitted on the end of the pole, an upwardly and forwardly projecting head formed integral with said ferrule having a reduced neck, a two-part bushing adapted to embrace said neck, the rear section of said bushing provided with a curved face adapted to bear against the outer surface of the yoke, a semicircular groove provided on the outer surface of the said bushing, a staple adapted to fit in said groove and embrace the bushing and pass through the yoke, and a retaining-plate on the opposite side of the yoke to which the free ends of the staple are riveted, substantially as shown and described.

608,563. GAGE-ADJUSTING TIE-PLATE. ALEXANDER R. R. HARRIS, Bristol, Tenn. Filed July 24, 1897. Serial No. 646,703. (No model.)

Claim.—1. A spike of substantially uniform transverse dimensions having beneath its head a recess reducing the thickness of the spike substantially as and for the purpose described.



2. A spike of substantially uniform transverse dimensions having a recess under its head formed by a detachable gib or key *h* having a flange or toe *f* at its lower end substantially as and for the purpose described.

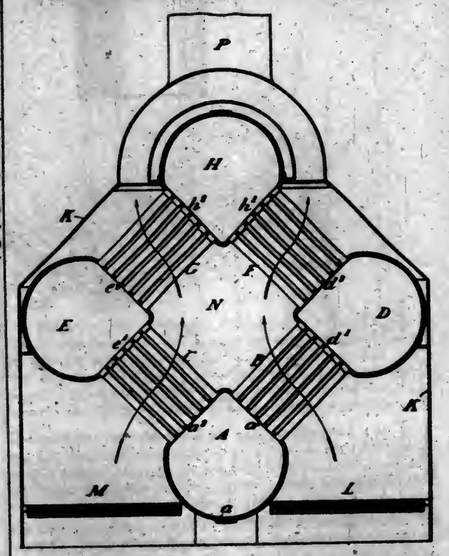
3. A rail and tie fastening, comprising a tie-plate having on its under side integral spike-tongues as described and two expanding-plug spikes, one having a straight shank, and the other having a recess just beneath its head that reduces the thickness of the spike, said two spikes being arranged to go upon opposite sides of the rail and to be interchangeable to correct the gage of the rail substantially as and for the purpose described.

4. The combination of a spike having two circular edges and two alternating flat sides, and a tie-plate having on opposite sides of its spike-holes two downwardly-extending tongues, thicker at their lower ends than they are at their upper ends, and having their inner faces flat and corresponding to the flat faces of the spike, to completely fill a bored hole in the tie substantially as described.

5. A railroad-tie plate having a flat horizontal middle portion beneath the rail, and downwardly-inclined side portions with spike-braces *s* on their upper surfaces, and spike-tongues on the under side at the junction of the horizontal and inclined portions substantially as and for the purpose described.

608,564. BREAST-PUMP. JOSEPH H. HOOVER, Waterloo, Iowa. Filed Aug. 9, 1897. Serial No. 647,804. (No model.)

Claim.—1. A breast-pump having a collapsible air-chamber, normally distended by a spiral spring placed within said air-chamber between the heads of said chamber, interposed between the milk tube and receptacle and an air-exhaust pump, substantially as shown and described.



2. A breast-pump consisting of a flared tube having a milk-receptacle formed on its circumference; a perforated nipple-shield secured on the flared end of said tube; a collapsible air-chamber connected with said flared tube, said collapsible air-chamber being normally distended by a spiral spring interposed between the heads of said air-chamber; and an air-exhaust pump distinct from but connected with said air-chamber, substantially as shown and described.

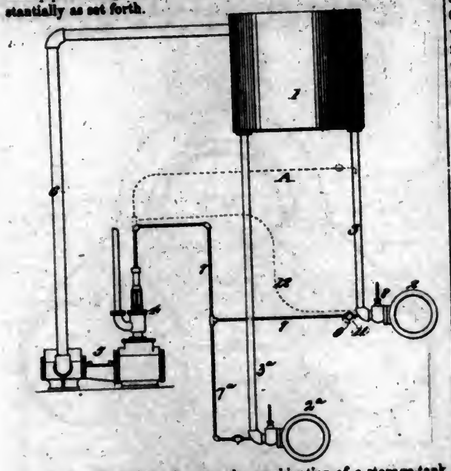
3. A breast-pump consisting of a flared tube having a milk-receptacle formed on its circumference; a perforated nipple-shield secured on the flared end of said tube; a flexible tube attached, at one end, to the small end of said flared tube and, at the other end, to a collapsible air-chamber; a collapsible air-chamber normally distended by a spiral spring interposed between the heads of said air-chamber; a rigid tube connecting said air-chamber and an air-exhaust pump; and an air-exhaust pump distinct from but connected with said air chamber, substantially as shown and described.

4. In a breast-pump, the combination with a perforated nipple-shield and a milk-receptacle, of a collapsible air-chamber, normally distended by a spiral spring interposed between the heads of said chamber, and an air-exhaust pump distinct from but connected with said air-chamber, substantially as shown and described.

5. In a breast-pump, the combination with a tube provided with a milk-receptacle and having a perforated nipple-shield attached to said tube, of a collapsible air-chamber, normally distended by a spiral spring interposed between the heads of said air-chamber, said air-chamber being connected with said tube, and an air-exhaust pump distinct from but connected with said air-chamber, substantially as shown and described.

608,565. WATER-TUBE BOILER. JOHN H. HOWSON, Hull, England, assignor of one-half to Ross, Downs & Thompson, Limited, same place. Filed Dec. 20, 1897. Serial No. 662,690. (No model.)

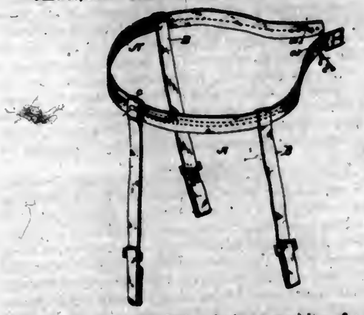
Claim.—1. The combination in a boiler-furnace of the opposite fire-chambers, a smoke-outlet above each fire-chamber communicating with a common take-off; and a series of four similar water-drums, each having a rounded portion and two opposite flattened sides standing substantially at right angles to each other, the drums being arranged equidistant with the apexes of their inclined sides pointing to a common center, one drum being at the bottom and interposed between the fire-chambers, another drum at top and between the smoke-outlets; with four series of tubes each series connecting the opposite flattened sides of adjoining drums, and a casing inclosing the drums, tubes and fire-chambers, all substantially as and for the purpose described.



2. The combination in a boiler-furnace of the opposite fire-chambers M, L, a smoke-outlet above each fire-chamber communicating with a common take-off; and a series of similar water-drums A, E, D, H, each having a rolled portion and two opposite flattened sides standing substantially at right angles to each other, the drums being arranged equidistant with the apexes of their inclined sides pointing to a common center, and the bottom drum A being interposed between the chambers M, L, and drum H being at top and interposed between the smoke-outlets; with a series of tubes C connecting the opposite flattened sides of drums A, E; as a series of tubes F connecting the opposite flattened sides of drums D, H; and a series of inclined tubes G connecting the opposite flattened sides of drums D and H, all of said tubes having one end enlarged at its point of connection with one of the drums so that the tubes can be withdrawn into the drums when necessary to repair the same, substantially as and for the purpose described.

608,566. HYDRAULIC ELEVATOR. LOUIS KRAMER, St. Louis, Mo. Filed May 3, 1897. Serial No. 634,666. (No model.)

Claim.—1. In a hydraulic elevator, the combination of a storage-tank, a hoisting-cylinder, a pump provided with a governor, a pipe forming a connection between the tank and the hoisting-cylinder, and a pipe forming a connection between the pump-governor and said tank-pipe and provided with a check-valve, means for applying said fluid-pressure in the tank or tank-pipe to the governor to stop the pump when the desired pressure is reached, substantially as set forth.

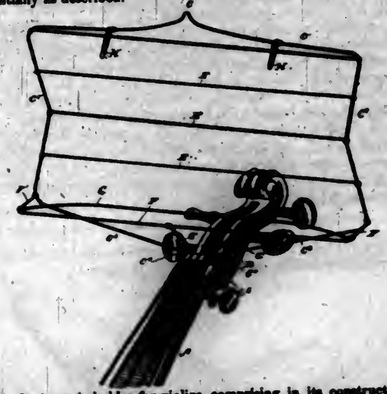


2. In a hydraulic elevator, the combination of a storage-tank, a hoisting-cylinder, a pipe forming a connection between the storage-tank and the hoisting-cylinder, a pump provided with a governor, a pipe forming a connection between the pump-governor and said tank-pipe, and a check-valve in the last-mentioned pipe; said pump-governor pipe connecting with said tank-pipe in close proximity to the valve that controls the passage of water from the latter pipe to the hoisting-cylinder, means for applying the fluid-pressure in the tank or

tank-pipe to the governor when the desired pressure is reached, substantially as set forth.

3. In a hydraulic elevator, the combination of a storage-tank, hoisting-cylinders, pipes forming connections between said tank and cylinders, a pump provided with a governor, pipes forming connections between said pump-governor and said tank-pipes, and check-valves provided with grooves or passages 10 and located in said governor-pipes, substantially as set forth.

608,567. SKIRT-LIFTER. MARY R. LUCAS, Omaha, Nebr. Filed June 30, 1897. Serial No. 643,906. (No model.)



Claim.—1. A skirt-lifting device comprising of a hollow belt, having a slot in rear portion, a supporting-strap secured to said belt over the slotted portion, supporting-straps depending from the sides of said belt, securing devices upon the lower ends of said straps, and means to adjust the rear strap laterally from the front of the belt, substantially as described and set forth.

2. The combination in a skirt-supporting device of a belt having a horizontal slot in its rear portion, a supporting-strap secured to said belt over the slotted portion, supporting-straps secured to the sides of said belt, folding clasps secured to the lower ends of the supporting-straps, and means to adjust the rear strap in a vertical and lateral direction from the front of the belt, as and for the purposes set forth.

608,568. MUSIC-HOLDER FOR VIOLINS. SOPHIA V. LUNDQUIST, Upsala, Fla. Filed Sept. 8, 1897. Serial No. 650,979. (No model.)

Claim.—1. A music-holder for violins, comprising in its construction a frame consisting of a top cross-bar, C', side bars, C², bottom wires, C³, extending from the lower ends of the side bars C² to reach the edges of the top of the violin-head at C⁴, thence bent downward, curved at C⁴ to form a circular clamp for the head of the violin, and provided with vertical flanges, C⁵, the clamping-screw passing through said flanges, and the cross-wire C⁶ to connect the wires C³ across the top of the violin-head, substantially as described.

2. A music-holder for violins, comprising in its construction a frame consisting of a top cross bar C', side bars C², bottom wires C³, extending from the lower ends of the side bars C² to reach the edges of the top of the violin-head at C⁴, thence bent downward, curved at C⁴ to form a circular clamp for the head of the violin and provided with vertical flanges C⁵, the clamping-screw passing through said flanges, the cross-wire G² to connect the wires C³ across the top of the violin-head, the cross-wire F, connected at the junction of the side bars C² and bottom wires C³ by right-angled end bends F', substantially as described.

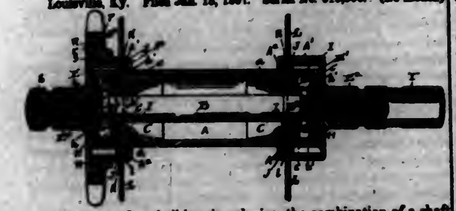
3. A music-holder for violins, comprising in its construction a frame consisting of a top cross-bar C', side bars C², bottom wires C³, extending from the lower ends of the side bars C² to reach the edges of the top of the violin-head at C⁴, thence bent downward, curved at C⁴ to form a circular clamp for the head of the violin and provided with vertical flanges C⁵, the clamping-screw passing through said flanges, the cross-wire G² to connect the wires C³ across the top of the violin-head, the cross-wire F, connected at the junction of the side bars C² and bottom wires C³ by right-angled end bends F', and an inwardly-curved, horizontal wire connecting the two ends of the cross-wire F at its junction with the bends F', substantially as described.

4. A music-holder for violins, comprising in its construction a frame consisting of a top cross-bar C', side bars C², cross-bars E connecting the side bars C², spring-fingers H mounted on the top cross-bar C', bottom wires C³, extending from the lower ends of the side bars C² to reach the edges of the top of the violin-head at C⁴, thence bent downward, curved at C⁴ to form a circular clamp for the head of the violin and provided with vertical flanges C⁵, the clamping-screw passing through said flanges, the cross-wire G² to connect the wires C³ across the top of the violin-head, the cross-wire F, connected at the junction of the side bars C² and bottom wires C³ by right-angled end bends F', substantially as described.

5. A music-holder for violins, comprising a main frame of wire substantially rectangular in outline, a bottom shelf or ledge for the music to rest upon, composed of wires C³ in continuation of the side bars of the main frame, the cross-wire F, angular ends F', and horizontal curved wire G, and a clamp, consisting of continuations of wires C², a cross-wire G² to connect them at the top of the head of the violin and a screw to draw their lower ends together below the head, braces G', connecting eyes wires F and G², and spring-fingers H, mounted on the upper cross-bar of the main frame, to engage over the upper edge of the music sheet or book, substantially as described.

608,569. WELL-BUCKET. WILLIAM D. MARTIN, Sr., Jackson, Tenn. Filed Nov. 13, 1897. Serial No. 658,430. (No model.)

Claim.—1. In combination with a well having a rectangular curbing, a plurality of buckets, each bucket in its cross-section being in the shape of a right-angle triangle, each bucket having in its bottom a valved water-inlet and a suitable means for operating the buckets.

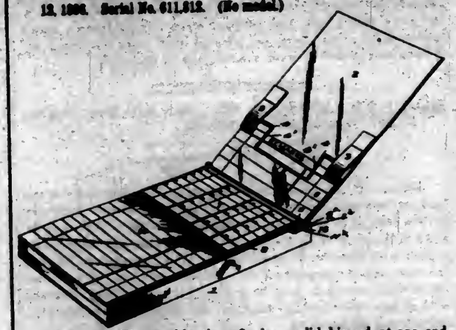


2. In combination with a well having a square curbing, a plurality of buckets, each bucket being in the shape of a right-angle triangle, each bucket having in its bottom a suitable valved water-inlet, the upper end of each bucket having converging sections, a suitable means for operating the buckets.

3. In combination with a well having a squared curbing, a plurality of buckets, each bucket in its transverse section being in the shape of a right-angle triangle, each bucket having in its bottom a valved water-inlet, each bucket having at its upper end converging sections, the upper ends of said sections terminating into an opening into the interior of the bucket, a ball passing through said opening and being secured to the inner surfaces of the bucket a suitable means for operating the buckets.

608,569.

608,570. BALL-BEARING DEVICE. JOSEPH MEYERS, Jr., Louisville, Ky. Filed Jan. 18, 1897. Serial No. 619,893. (No model.)



Claim.—1. In a ball-bearing device, the combination of a shaft or axle having a threaded portion at each end, a hub or shell having enlarged chambers at each end, a shouldered cone fixed within each end portion of said hub or shell between the said chambers and having an externally-reduced outwardly-beveled bearing portion which extends into the respective chamber, a hollow ball-cup screwed upon each end portion of said shaft or axle and seated within the said chambers, the balls within said cups, and ball-retaining devices at both ends of the said cups whereby the balls are held within the cups when the latter are removed, together with the annular packing or dust-guard rings, one at each side of the bearing, and seated between the inner wall of the said chambers and the shoulder of the cone and the inner end of the cup and the ring therein substantially as specified.

2. In a wheel-hub, the combination with the hub proper having enlarged end portions formed each with a series of spoke-receiving apertures or openings, of the shouldered bearing-cones fixed within the said hub between the said enlarged portions and extending into the same, the axle passing loosely through the said cones, the ball-bearing cups or cups threaded upon said axle and extending into said enlarged portions, the balls seated within the said cups and upon the said cones, a retaining-ring seated in the outer or bottom wall of each cup, a second retaining-ring seated in the inner end of said cup, and a packing-ring or dust-guard seated upon the shoulder of each of the cones and against the inner end of each cup and filling completely the space into which the spoke-holes open, substantially as specified.

3. In a wheel-hub, the combination with the hub proper having the enlarged end portions, the shouldered cones permanently fixed within said hub, the axle, the ball-cups threaded upon said axle and extending within the said enlarged portions, and the balls therein, there being a space between the inner end of each of said cups and the shoulder of the adjacent cone, said enlarged portions having each a series of spoke-holes opening into said space, substantially as specified.

608,571. SALES-RECORDING CHECK-BOOK. WILLIAM H. NORTHALL and FREDERICK W. SHERPHAN, Evansville, Ind. Filed Nov. 12, 1896. Serial No. 611,812. (No model.)

Claim.—1. The combination of a box, a lid hinged at one end thereof, clamps secured on the under side of said hinged lid, means for releasing said clamps also held on the under side of said lid, a leaf hinged at the opposite end of said box forming a writing-surface, a guide secured near the end of the box near the end of said hinged leaf, and the wire secured in the guide, substantially as described.

2. The combination of the box having the hinged lid, the spring-clamp carried by said lid, the carbon and clerk's record-slip retained by said clamp and extending over the box when the lid is raised and the cashier's and purchaser's checks arranged in the box.

3. The combination of the box or case having the hinged lid, the clerk's record-slip carried by the lid and extending over the box when the lid is raised, the transferring-carbon under said slip, the additional hinged leaf on said box, the carbon and clerk's-slip retaining clamps carried by the hinged cover or lid, the guide secured across the box in the corner thereof, and the continuous cashier's and purchaser's record-slips passing around the said guide and inclosed in the box.

4. The combination of a box, a lid hinged at one end thereof, clamps secured on the under side of said lid, means to release said clamps from engagement and hold in place on the under side of said lid, a leaf hinged at the opposite end of said box forming a writing-surface, a clerk's record-slip and carbon secured to the under side of said lid by said clamps, two continuous slips located in the box below the said hinged leaf, a guide in the box near the end of said hinged leaf secured to separate and regulate the said slips, a carbon placed between the two continuous slips, and a wire to hold the carbon in place located in said guide.

608,572. WRENCH. FREDERICK CLARK, New York, N. Y. Filed Aug. 13, 1897. Serial No. 648,127. (No model.)

Claim.—1. In a wrench, the combination with a handle; a head thereon provided with a pair of intersecting grooves; of a pair of jaws adapted to slide in said grooves, and provided with teeth thereon; and a screw engaging the teeth on said jaws, for sliding the latter, substantially as described.

2. In a wrench, the combination with a handle; a head thereon provided with a pair of intersecting grooves; and a pair of jaws having toothed bars thereon extending into said grooves; of a screw having threads thereon engaging the teeth on said bars, and adapted to cause said jaws to slide in said grooves when said screw is turned, substantially as described.

3. In a wrench, the combination with a handle; a head thereon provided with a pair of intersecting grooves; a pair of jaws having toothed bars thereon extending into said grooves and guides for said bars; of a screw having threads thereon engaging the teeth on said bars, and adapted to cause said jaws to slide in said grooves when said screw is turned, substantially as described.

4. In a wrench, the combination with a handle; a head thereon provided with a pair of intersecting grooves; a pair of jaws having toothed bars thereon extending into said grooves; of a screw having conical threads thereon engaging the teeth on said bars, and adapted to cause said jaws to slide in said grooves when said screw is turned, substantially as described.

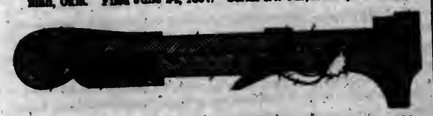
5. In a wrench, the combination with a handle; a head thereon provided with a pair of intersecting grooves; a pair of jaws having toothed bars thereon extending into said grooves; of a double-conical screw having right and left hand screw-threads thereon engaging the teeth on said bars, and adapted when turned, to cause said jaws to slide in said grooves, substantially as described.

608,573. HORSESHOE. NEIL L. OLSON, Butte, Mont. Filed May 15, 1897. Serial No. 636,705. (No model.)

Claim.—1. The horseshoe described, having thickened toe and heel portions and sockets therein, the socket or sockets in the toe portion ranging at an incline approaching an angle of forty-five degrees to the plane of the shoe, and provided at the inner ends of said sockets with seats for the calk-keys, the calks having stems fitted to the shoe-sockets and grooved and notched heads, and the keys having at their inner ends portions to engage the seats of the shoes and at their outer ends heads to enter the notches or sockets in the calks, substantially as described.

2. A horseshoe-calk having a tapered head provided in its tapered sides near its upper end with sockets for the fastening-keys, and having said tapered sides grooved forming a central web, and ribs projecting therefrom, substantially as described.

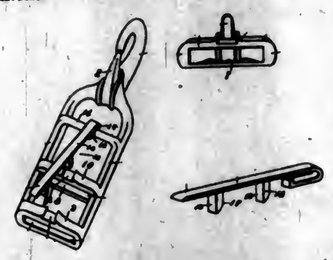
608,574. BICYCLE-WHEEL. MOSHEIM C. OVIATT, Traverse City, Mich. Filed Aug. 31, 1897. Serial No. 650,145. (No model.)



Claim.—1. A vehicle-wheel, comprising inner and outer rims, a flexible band interposed between the two rims but not touching them, and adapted to move toward and from the rims, devices connecting the band with both the rims, and means for adjusting the tension of the band by moving it radially at different points throughout its length toward or from the center of the wheel.

2. A vehicle-wheel, comprising inner and outer rims, a flexible band interposed between the two rims but not touching them and free to move radially toward and from the rims, radial bolts or rods for holding the band in place, and means applied to the bolts for moving the band at different points throughout its length radially to adjust the tension thereof.

3. A vehicle-wheel provided with inner and outer rims, a flexible band interposed between the two rims, bolts passing inward from the outer rim to connect it with the band, curved washers on said bolts inside the band, and nuts on the bolts bearing on said washers, substantially as described.

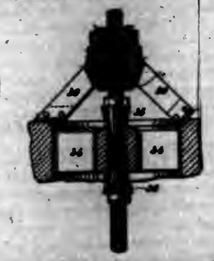


4. A vehicle-wheel, comprising inner and outer rims, a flexible band interposed between the two rims, bolts connecting the band with the outer rim, curved washers on the ends of the bolts, nuts secured to the bolts and holding the washers against the band, bolts connecting the flexible band with the inner rim, curved washers against which the heads of the bolts bear, nuts on the screw-threaded ends of said last-mentioned bolts, and elastic washers interposed between the nuts and the inner rim.

608,575. ADJUSTABLE WRENCH. WALLACE G. PARKER, Norman, Okla. Filed June 24, 1897. Serial No. 642,133. (No model.)

Claim.—The combination in an adjustable wrench, of a rigid bar carrying a jaw at its outer end and provided with a toothed rack on its inner surface, with a sliding bar also provided with a jaw at its outer end, a pinion pivoted in a chamber of said sliding bar projecting beyond both surfaces thereof, a pawl pivoted to the sliding bar and engaging with the pinion, and yokes on the sliding bar embracing the rigid bar and holding the pinion and rack in engagement, substantially as set forth.

608,576. COMBINED BUCKLE AND SNAP HOOK. JACOB POLKA, Smith Centre, Kans. Filed Feb. 24, 1897. Serial No. 624,760. (No model.)



Claim.—1. A buckle comprising transverse bars forming a strap-loop, one of said bars being provided with an inclined-sided recess, a pivoted clasp capable of longitudinal movement and having a portion of its sides inclined to permit its engagement within the recess, and a tongue extending from the clasp and designed to engage with a strap passed through the loop, substantially as specified.

2. A buckle comprising a strap-loop, the upper bar of which is provided with an inclined-sided recess, a longitudinally-movable pivoted clasp having a portion of its sides inclined, a tongue extending from the clasp and designed to engage a strap passing through the strap-loop, and means for locking the clasp against longitudinal movement, substantially as specified.

3. In a combined snap-hook and buckle, the combination with a snap-hook provided with rearwardly-extending side bars, transverse bars extending between the side bars and constituting strap-loops, the upper bars of said loops being recessed, and the recess in one of the bars having inclined sides, a transverse clasp-bar, a clasp having loose pivotal connection with said clasp-bar whereby it is capable of longitudinal and pivotal movement, said clasp having a portion of its sides inclined to permit its engagement with the inclined-sided recess in one of the loop-bars, tongues extending from the clasp designed to engage a strap passed through the strap loops, and a movable locking-leg at the extremity of the clasp designed to be bent down to lock said clasp against longitudinal movement, substantially as specified.

608,577. APPARATUS FOR REMOVING VALVES, BORING CYLINDERS, &c. PERCIVAL J. PERRY, Manchester, England. Filed Mar. 21, 1898. Serial No. 674,647. (No model.)

Claim.—1. In an apparatus for repairing valve-seats, in which the proper center is determined by the hole for the valve-stem, the combination of a threaded spindle, oppositely-cut nuts for holding said spindle in position, a hollow stem or casing through which the spindle passes, cutting-arms carried on said stem, and means for feeding said cutters down said spindle, substantially as described.

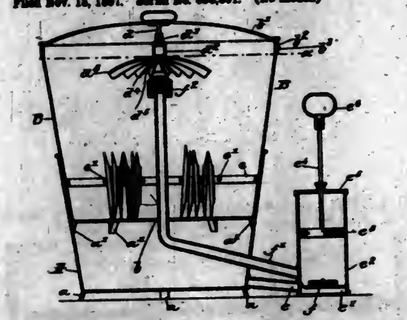
2. In an apparatus for repairing valve-seats, in which the proper center is determined by the hole for the valve stem, the combination of a threaded spindle, oppositely-cut conical nuts for holding said spindle in position, an internally-threaded hollow stem or casing engaging said spindle, a boss provided with cutting-arms mounted on said stem, cutters on said arms, the upper part of said stem or casing being externally screw-threaded, a nut engaging said screw-threads, and means for securing the nut, stem, and spindle together, substantially as described.

608,578. CLICHÉ FOR PRINTING PATTERNS. ERNEST GUEDON, Lille, France, assignor to Henri Menard Constenoble, same place. Filed Dec. 3, 1895. Serial No. 570,994. (No model.) Patented in France Dec. 6, 1894, No. 242,310; in Belgium Mar. 6, 1895, No. 114,208, and in Austria May 4, 1895, No. 45/1,502.

Claim.—A cliché for printing patterns on garments or the like, composed solely of a thin flexible sheet or band of a single layer of material and adapted to be rolled up and having the outlines of the pattern pressed up in relief thereon, substantially as set forth.

608,579. STEP-LADDER. CHRIS ERICKSON, Clipper Gap, Cal. Filed July 2, 1897. Serial No. 643,994. (No model.)

Claim.—1. In a step-ladder, a step-frame, a supporting-leg pivoted thereto, a supporting-frame for the step-frame, whose members are pivotally connected one to the other, and means for locking said supporting-frame and said step-frame together.



2. In a step-ladder, a step-frame having converging side bars, a supporting-leg pivoted thereto, a supporting-frame for the step-frame, and a projection on said supporting-frame adapted to fit between the side bars of the step-frame, and be engaged thereby, as and for the purpose set forth.

3. In a step-ladder, a step-frame having converging side bars, a supporting-leg pivoted thereto, a supporting-frame for the step-frame comprising legs and cross-bars pivotally connected together, and a projection on one of said cross-bars adapted to fit between the side bars of the step-frame and to be engaged thereby, as and for the purpose set forth.

4. In a step-ladder, a step-frame having converging side bars, and a supporting-leg pivoted thereto, a supporting-frame for the step-frame made up of legs and cross-bars pivoted one to the other, a projection on one of said cross-bars adapted to fit between the side bars of the step-frame and to be engaged thereby, and means for moving said step-frame and said supporting-frame longitudinally with respect to each other, as and for the purpose set forth.

5. In a step-ladder, a step-frame having converging side bars, a supporting-leg pivoted thereto, a supporting-frame for the step-frame made up of legs and cross-bars pivotally connected to each other, a circular disk or plate secured to the upper of said cross-bars fitting between the side bars of the step-frame and adapted to be engaged thereby, a guide-bar on said step-frame having an elongated slot therein, a pin on one of the side bars of the supporting-frame fitting and moving in said slot, and a cam-lever fulcrumed to said step-frame and adapted to engage one of the cross-bars on said supporting-frame, as and for the purpose set forth.

608,580. DISH-CLEANER. EDGAR SHAW, Swampscott, Mass. Filed Nov. 18, 1897. Serial No. 658,801. (No model.)

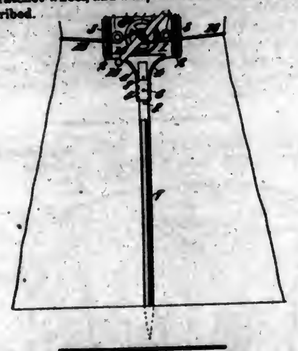
Claim.—1. In a dish-washing apparatus, a reservoir, a dish-pan sustained therein revolubly and having means for holding dishes on edge, combined with the cover, and the spreader supported thereby, a pump having outlet and discharge pipes, the said discharge-pipe being extended through the said reservoir and centrally through the bottom of said dish-pan and provided with a nozzle, the dish-pan being revolubly about the said discharge-pipe, substantially as described.

2. The reservoir A having rests *a'*, the dish-pan B inserted in said reservoir and sustained by said rests, said dish-pan having a perforated bottom and a closed cover, and having means for sustaining plates on edge, combined with a spreader suspended from the lower side of said cover, a pump located outside the reservoir and pan having an inlet *c*, and a discharge-pipe *f'* extended through there servoir and centrally up into the dish-pan and provided with a nozzle, substantially as described.

608,581. WINDOW-WASHER. SARAH URMSTON, Indianapolis, Ind. Filed July 14, 1897. Serial No. 644,548. (Model.)

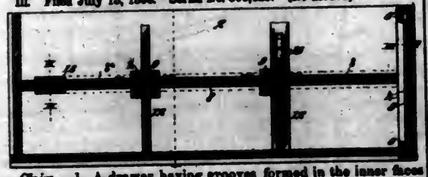
Claim.—1. In a window-washing appliance, the combination of a wiper, a scrubbing-brush, a sponge or mop, and a vibrating spring-loop adapted to grasp the substance of the mop and to hold the scrubbing-brush in its position, substantially as described.

2. In a window-washing appliance having a wiper, a scrubbing-brush, and a mop, the combination of a swinging loop having an eccentric shank, a spring for throwing and holding the loop in its operative or inoperative position, and a sleeve or ferrule for holding and locking the spring-loop in its operative position, substantially as described.



608,582. CORN-SHOCK COMPRESSOR. HARMON VAN PELT, New Athens, Ill. Filed Nov. 15, 1897. Serial No. 658,548. (No model.)

Claim.—1. In a shock-compressor, the combination of a standard, a plate attached to said standard, a ratchet-wheel mounted on said plate, a reel carried by said ratchet-wheel; said reel comprising a web having inwardly-inclined edges and handle-arms extending at angles from said web, and a rope attached to said reel, substantially as described.

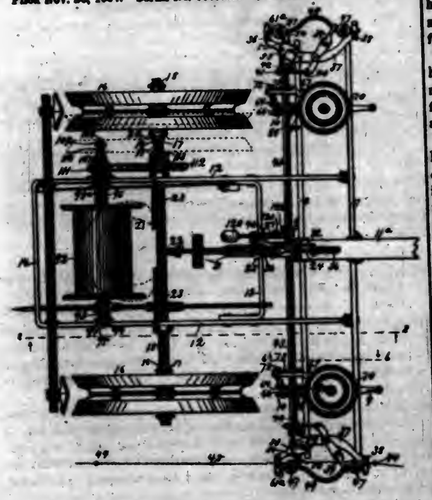


2. In a shock-compressor, the combination of a standard, a plate attached to said standard, a ratchet-wheel mounted on said plate, a detent-dog, a reel carried by said ratchet-wheel; said reel comprising a web having inwardly-inclined edges and handle-arms extending at angles from said web, and a rope attached to said reel, substantially as described.

3. In a shock-compressor, the combination of a plate, a sleeve carried by said plate, a standard adjustably attached to said sleeve, a ratchet-wheel and a detent-dog mounted on said plate, a reel car-

ried by said ratchet-wheel, and a rope attached to said reel, substantially as described.

603,583. HARDWARE-DRAWER. JOHN D. WARREN, Chicago, Ill. Filed July 13, 1896. Serial No. 599,023. (No model.)



Claim.—1. A drawer having grooves formed in the inner faces of the sides, slides having tenons fitting in said grooves, partitions fitting in grooves formed in the slides, and springs 16 secured to the partitions; substantially as set forth.

2. A drawer having dovetail grooves formed in the inner faces of the sides, slides having dovetail tenons fitting in said grooves, partitions fitting in grooves in the slides, and springs 16 secured to the partitions; substantially as set forth.

3. In a drawer having dovetail grooves formed in the inner faces of the slides and provided with enlargements 13, slides having dovetail tenons fitting in said grooves, partitions fitting in grooves formed in the slides, and springs 16 secured to the partitions, substantially as set forth.

603,584. CHECK-ROW CORN-PLANTER. LEWIS R. WATERMAN, Moline, Ill., assignor to the Deere & Manzur Company, same place. Filed Nov. 20, 1897. Serial No. 659,263. (No model.)

Claim.—1. In a planter the combination with a rear frame supported on wheels, and a forward frame having runners or furrow-openers and seeding mechanism, of a hand-lever pivotally mounted on said rear frame, connected with the forward frame, and provided with a locking-dog, a rack-bar with which said dog engages, a foot-lever pivotally mounted on said rear frame, a link connected at one end with one end of said lever and its other end adapted to disengage said dog from the rack-bar, substantially as described.

2. In a planter, the combination with a rear frame mounted on wheels, and a forward frame having furrow-openers or runners and seeding mechanism, of a hand-lever mounted on said rear frame and connected with the forward frame, a spring-actuated locking-dog carried by said hand-lever, a rack-bar, a foot-lever pivotally mounted on said rear frame, a link connected at one end with one end of said foot-lever, and its other end adapted to engage with said dog to disengage it from the rack-bar, and a projection laterally from said foot-lever, which projection engages with the hand-lever when the foot-lever is operated, and is removed therefrom by said spring which actuates the dog, substantially as described.

3. In a planter, the combination with a rear frame mounted on wheels, and a forward frame having runners or furrow-openers, and seeding mechanism, of a hand-lever mounted on said rear frame and connected with the forward frame, a spring-actuated locking-dog carried by said hand-lever and having a laterally-projecting pin or lug, a rack-bar, a foot-lever mounted on said rear frame, a link connected at one end with one end of said foot-lever and its other end having a slot which engages with said pin or lug, and a pin or lug projecting laterally from one end of said foot-lever, adapted for engagement with the hand-lever, substantially as described.

4. In a check-row planter, and in combination, a check-row head, a forked lever mounted on said head, a tilting bar hinged or journaled to said head, carrying guide-pulleys and a projecting arm, a spring-actuated detent-lever pivotally mounted on said head and adapted for engagement with the upper side of said arm, and another for engagement with its lower side, and a stop-pin, for said detent-lever, and a check-row line, substantially as described.

5. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys and a projecting arm, a spring-actuated detent having a lug for engagement with the upper side of said arm, a stop-pin, and a check-row line, substantially as described.

6. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys and a projecting arm, a spring-actuated detent having a lug for engagement with the upper side of said arm, and a series of holes for a stop-pin, a stop-pin, and a check-row line, substantially as described.

7. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys and a projecting arm, a stop to limit the movement of said tilting bar when it is turned up into position for operation, a spring-actuated detent having a lug, with a cam-shaped or inclined upper side, for engagement with the upper side of said arm, a stop-pin, and a check-row line, substantially as described.

8. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys loosely mounted on said head, whereby it may yield rearwardly and return forwardly, substantially as described.

9. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys loosely mounted on said head, whereby it may yield rearwardly and return forwardly, a spring for imparting such forward movement thereto, and a check-row line, substantially as described.

10. In a check-row planter, and in combination, a check-row head, a forked lever, a tilting bar carrying guide-pulleys, mounted on said head to yield rearwardly and return forwardly, a spring for imparting the forward or return movement to said tilting bar, a check-row line, and means for limiting the forward and backward movements of said tilting bar, substantially as described.

11. In a check-row planter, and in combination, a check-row head, a detent mounted on said head, a forked lever, a tilting bar carrying guide-pulleys and a lateral arm projecting therefrom for engagement with said detent, said tilting bar mounted on the check-row head to yield rearwardly and return forwardly, a spring for imparting the forward or return movement to said tilting bar, and a check-row line, substantially as described.

12. In a check-row planter, and in combination, a check-row head, a forked lever, a spring-actuated detent pivotally mounted on said head and provided with a stop-pin hole, a stop-pin, a tilting bar carrying guide-pulleys and a lateral arm projecting therefrom for engagement with said detent, said tilting bar mounted on the check-row head to yield rearwardly and return forwardly, a spring for imparting the forward or return movements to said tilting bar, stops for limiting the forward and return movements of said tilting bar, and a check-row line, substantially as described.

13. In a planter, and in combination with a valve in the seedbox, a seed tube or duct, a discharging-valve pivotally mounted in the seed-tube with its lower seed-discharging end or valve proper near the lower end of said tube and its upper end near the upper end thereof, and an intermediate valve, fixed at one end to the discharge-valve, and its other end bent to form the intermediate valve proper, which is spring-yielding to delay its opening, substantially as described.

14. In a planter, and in combination with a valve in the seedbox, a seed tube or duct having a front wall with a longer inclined upper part and a substantially vertical lower part, a recess in said lower part, a shelf beneath said recess, a seed-discharging valve having a projecting plate which enters said recess, and a seed-cup which seats over said shelf as a bottom therefor, and an intermediate valve fixed to said discharge-valve, which intermediate valve is spring-yielding to delay its opening, substantially as described.

15. In a planter, and in combination with a valve in the seedbox, and a removable seed-discharging valve, a seed tube or duct having a front wall with a substantially vertical part at its lower end, a shelf at the lower end of said vertical part adapted to retain the seed in said valve, and having a long inclined upper part whereby the seed will be discharged free of said shelf when the seed-discharging valve is removed, substantially as described.

16. In a check-row planter, and in combination with a planter-frame, an axle, supporting-wheels, a reel, a bifurcated open bearing for one journal of said reel, means for securing the journal in said bearing, and a rotatable head in which said other journal of the reel is removably seated, substantially as described.

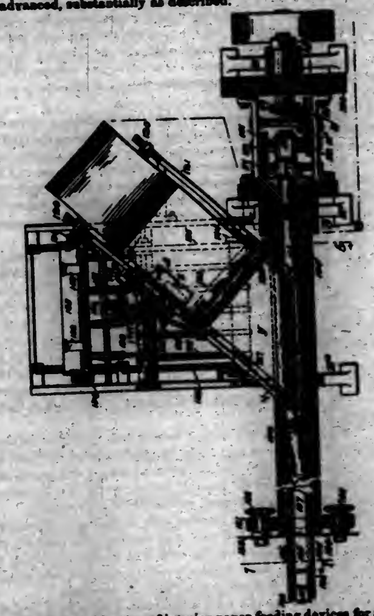
17. In a check-row planter, and in combination, substantially as described, a planter-frame, axle, supporting-wheels, a reel, a journal fixed to one end of said reel, a bearing for said journal, a bearing mounted on said frame, a head journaled in said bearing, and a shaft projecting from the other end of said reel, removably seated in said head said shaft and head of such form that the shaft and reel will be rotated with the head, while the shaft may be withdrawn endwise from the head.

18. In a check-row corn-planter, and in combination with a planter-frame, an axle, and supporting-wheels, one of which wheels is adjustable on the axle, a sprocket-wheel loosely mounted on the axle to gear by a clutch with said adjustable wheel, a reel, a bearing for one journal thereof, a head journaled to the frame, a shaft fixed to the reel and removably seated in said head, a sprocket-wheel with a cone-shaped hub, a cup-shaped cone, a spring, a threaded bolt, a nut, and a sprocket-chain, all constructed and arranged to operate substantially as and for the purpose specified.

19. In a check-row planter, and in combination, a frame, supporting-wheels, a reel journaled in bearings on said frame, a driver's seat, supporting-bars for said seat, an anchor for the check-row line, having a bent end for a guide for said line in reeling it, and a hook fixed to the anchor for pivotally engaging it with the support, substantially as described.

20. In a check-row planter, and in combination, a frame, supporting-wheels, a reel journaled in bearings on said frame, an anchor for the check-row line, a brake-shoe fixed to said anchor, whereby the anchor may be used as a brake for the reel, substantially as described.

21. In a check-row planter, and in combination, a seedbox, rotatable seed-cup plates or disks mounted in said box, a rock-shaft, a seed-tube standard with seed duct or channel, a pawl for actuating said seed-cup plates, a seed-discharging valve pivotally mounted in said duct or channel, and its upper end pivotally connected with said pawl, and a radius-arm projecting from the rock-shaft, said radius-arm having a slot in its outer end through which a pin projects from the upper end of said seed-discharging valve, substantially as described.



22. A combined anchor for planter check-row lines, comprising an anchor for said lines, a reel-brake, and a guide for the check-row line in reeling it or taking it up by the planter, substantially as described.

23. A combination comprising a locking hand-lever, and a foot-lever pivoted to move independently of said hand-lever, and means interposed between said levers, whereby the hand-lever may be locked, unlocked, and adjusted by the foot-lever alone, substantially as described.

24. In a check-row planter, and in combination, substantially as described, a planter-frame, a reel, a journal fixed to one end of said reel, a bearing for said journal, a bearing mounted on said frame, a head journaled in said bearing and having a tapered outer end, a shaft projecting from the other end of said reel and removably seated in said head, a sprocket-wheel journaled on the tapering end of said head, a belt connected with said head, a cup-shaped washer, a spring coiled on and a nut screw-threaded onto said bolt, whereby the washer, cup-shaped cone and head may be held in such frictional contact, as desired.

603,585. WRAPPING-MACHINE. LOUDEN C. CROWELL, Brooklyn, N. Y., assignor to Robert Ilsa, Theodore H. Head, and Charles W. Carpenter, New York, N. Y. Filed Aug. 4, 1897. Serial No. 647,049. (No model.)

Claim.—1. The combination of interior paper-feeding devices for advancing a succession of independent papers, and means for winding a succession of wrappers spirally about the papers as they are advanced, substantially as described.

2. The combination of interior paper-feeding devices for advancing a succession of independent papers, means for delivering the papers successively to said feeding devices transversely to the direction in which they are advanced by the feeding devices, and means for winding a succession of wrappers spirally about the papers as they are advanced, substantially as described.

3. The combination of interior paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

4. The combination of interior paper-feeding devices for advancing a succession of independent papers, means for delivering the papers successively to said feeding devices, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, pasting devices for applying a line of paste to one edge of the wrapper-web for securing together the successive windings of wrapper forming the wrapper-tube, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

5. The combination of interior paper feeding and rotating devices for advancing a succession of independent papers, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

6. The combination of interior paper feeding and rotating devices for advancing a succession of independent papers, means for guiding a continuous wrapper-web to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

7. The combination of interior paper feeding and rotating devices for advancing a succession of independent papers, means for delivering the papers successively to said feeding and rotating devices transversely to the direction in which they are advanced by said feeding and rotating devices, means for guiding a continuous wrapper-web to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

8. The combination of a core, means for advancing a paper lon-

gitudinally on the core, and means for winding a wrapper about the core and the paper to form a spirally-wound wrapper-tube inclosing the core and the paper thereon, substantially as described.

9. The combination of a core, means for advancing a succession of independent papers longitudinally on the core, means for winding a continuous wrapper-web about the core and the papers on the core to form a continuous spirally-wound wrapper-tube inclosing the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

10. The combination of a core, means for advancing a succession of independent papers longitudinally on the core, means for feeding the papers successively to the core transversely to the axis of the core, means for winding a continuous wrapper-web about the core and the papers on the core to form a continuous spirally-wound wrapper-tube inclosing the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

11. The combination of a rotating core, means for advancing a paper longitudinally on the core as it rotates, and means for guiding a wrapper to the core at an angle to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.

12. The combination of a rotating core, means for advancing a succession of independent papers longitudinally on said core as it rotates, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

13. The combination of a core, a feeding-belt forming a portion of the surface of the core and moving longitudinally of the core to advance a paper on the core, and means for winding a wrapper about the core and the paper to form a spirally-wound wrapper-tube inclosing the core and the paper thereon, substantially as described.

14. The combination of a rotating core, a feeding-belt forming a portion of the surface of the core and moving longitudinally of the core to advance a paper on the core, and means for guiding a wrapper to the core to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.

15. The combination of a core, a feeding-belt forming a portion of the surface of the core and moving longitudinally of the core to advance a succession of independent papers, means for winding a continuous wrapper-web about the core and the papers on the core to form a continuous spirally-wound wrapper-tube inclosing the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

16. The combination of a rotating core, and moving longitudinally of the core to advance a succession of independent papers, means for guiding a continuous wrapper-web to the core to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

17. The combination of a rotating core, a feeding-belt forming a portion of the surface of the core and moving longitudinally of the core to advance a succession of independent papers, means for feeding the papers successively to the core transversely to the axis of the core, means for guiding a continuous wrapper-web to the core to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

18. The combination of a rotating core, a casing extending about the core, means for advancing a paper longitudinally on the rotating core inside the casing, and means for guiding a wrapper to the core at an angle to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.

19. The combination of a rotating core, a casing extending about the core, means for advancing a succession of independent papers longitudinally on the rotating core inside the casing, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

20. The combination of a rotating core, a casing extending about the core, means for advancing a succession of independent papers longitudinally on the rotating core inside the casing, means for feeding the papers successively to the core transversely to the axis of the core through an opening in the casing, means for guiding a continuous wrapper-web through an opening in the casing to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

21. The combination of a rotating core, feeding-belts forming a portion of the surface of the core and moving longitudinally of the core to advance a succession of independent papers, a casing extending about the core, means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

22. The combination in a severing device, of a plurality of segmental rotary severing-blades arranged about the path of the article to be severed and mounted to rotate in a plane transverse to the longitudinal axis of the article to be severed, and means for giving the article to be severed and the severing-blades a relative movement of rotation about the axis of the article, substantially as described.

23. The combination in a severing device, of feeding devices for the article to be severed, a plurality of segmental rotary severing-blades arranged about the path of the article to be severed and mounted to rotate in a plane transverse to the longitudinal axis of the article to be severed, means for giving the article to be severed and the severing-blades a relative movement of rotation about the axis of the article, and means for reciprocating the severing-blades longitudinally of the direction of movement of the article to move with the article when they are rotating in severing position and to return when they are rotating out of severing position, substantially as described.

24. The combination in a severing device, of feeding and rotating devices for the article to be severed, a plurality of segmental rotary severing-blades arranged about the path of the article to be severed and mounted to rotate in a plane at right angles to the longitudinal axis of the article to be severed, and means for reciprocating the severing-blades longitudinally of the direction of movement of the article to move with the article when they are rotating in severing position and to return when they are rotating out of severing position, substantially as described.

25. The combination with paper feeding and rotating devices for advancing a succession of independent papers, and means for guiding a continuous wrapper-web to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, of a plurality of segmental rotary severing-blades arranged about the path of the wrapper-tube and inclosed papers and mounted to rotate in a plane at right angles to the axis of the wrapper-tube, and means for reciprocating the severing-blades longitudinally of the direction of movement of the wrapper-tube to move with the wrapper-tube when they are rotating in severing position and to return when they are rotating out of severing position, substantially as described.

26. The combination of the rotating frame 101, core 100 carried by said frame, feeding-belts 107, 107ª forming a portion of the surface of the core and turning on rolls 106, 106ª carried by said core and on driving-rolls 108, 108ª mounted in said frame, means for driving the rolls 108, 108ª as the frame rotates, means for feeding a succession of independent papers to the core, and means for guiding a continuous wrapper-web to the core at an angle to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, substantially as described.

27. The combination of the rotating core 100, feeding-belts 107, 107ª forming a portion of the surface of the core and moving longitudinally of the core to advance a succession of independent papers, means for guiding a continuous wrapper-web to the core to form a continuous spirally-wound wrapper-tube about the core and the papers thereon, means for severing the wrapper-tube between successive papers as the tube and inclosed papers are advanced on the core, and guards 165 and 165ª for depressing the feeding-belts at the point where the wrapper-tube is severed, substantially as described.

28. The combination of the rotating core 100, feeding-belts 107, 107ª forming a portion of the surface of the core and moving longitudinally of the core to advance a paper on the core, and means for guiding a wrapper to the core to form a spirally-wound wrapper-tube about the core and the paper thereon, substantially as described.

29. The combination in a severing device, of feeding devices for the article to be severed, a segmental rotary severing-blade mounted to rotate in a plane transverse to the longitudinal axis of the article to be severed, means for giving the article to be severed and the severing-blade a relative movement of rotation about the axis of the article, and means for reciprocating the severing-blade longitudinally of the direction of movement of the article to move with the article when it is rotating in severing position and to return when it is rotating out of severing position, substantially as described.

30. The combination of a core, and means for advancing a paper longitudinally on the core and simultaneously applying a wrapper about the core and paper to form a wrapper-tube inclosing the core and the paper thereon, substantially as described.

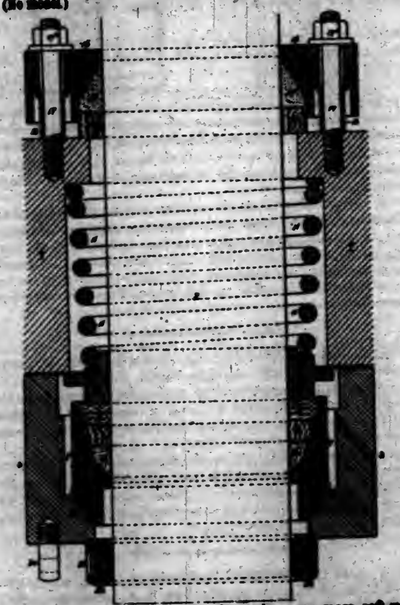
31. The combination of a rotating core, and means for advancing a paper longitudinally on the core as it rotates and simultaneously applying a wrapper about the core and paper to form a wrapper-tube inclosing the core and the paper thereon, substantially as described.

32. The combination of a rotating core, a feeding-belt forming a portion of the surface of the core and moving longitudinally of the core to advance a paper on the core, and means for applying a wrapper about the core and paper to form a wrapper-tube inclosing the core and the paper thereon, substantially as described.

603,586. ROLLER-BEARING. EDWIN W. DAVIS, Geneva, Minn. Filed June 8, 1897. Serial No. 640,084. (No model.)

Claim.—In a sectional hub, the combination, with the central portion formed with a central opening and with peripheral recesses, the disks secured thereto formed with corresponding openings, the rings secured to said disks having enlarged central openings, the end disks formed with openings corresponding with those of the other disks and the screw-bolts for securing said disks and rings to each other, of the cylindrical rollers loosely inserted in said rings and projecting beyond the openings in said disks, and the axle-spindle of a diameter less than the openings in said disks and against which said rollers abut, substantially as described.

603,587. OIL-FILTER. CHRISTIAN DOHM, Philadelphia, Pa., assignor to Harlan P. Moss, Easton, Pa. Filed July 26, 1897. Serial No. 646,044. (No model.)



Claim.—1. In an oil-filter, the combination with a chamber A^m, a filter in the lower part of the said chamber, and means for introducing the oil beneath the said filter; of a second chamber A^9, means for introducing water in the said second chamber A^9, a sight-glass opening into the said chamber A^9 at two points, a pipe extending from the chamber A^m through the said chamber A^9, a valve adapted to open the said pipe into the said sight-glass, and means for drawing the oil off from the water, substantially as described.

2. In an oil-filter, the combination with a chamber, a filter in the lower part of the said chamber, a funnel in the upper part of the said chamber, and a pipe from the said funnel extending through the said filter; of a second chamber A^9, means for introducing water in the said second chamber A^9, a sight-glass opening into the said chamber A^9 at two points, a pipe extending from the chamber A^m through the said chamber A^9, a valve adapted to open the said pipe into the said sight-glass, and means for drawing the oil off from the water, substantially as described.

3. An oil-filter comprising two chambers; a filter in the lower portion of one of said chambers; an inlet-pipe entering said chamber and discharging beneath said filter; a drain-cock to said chamber; a downwardly-inclined pipe leading through the second chamber from said first chamber, and opening outside of said second chamber; a plug in the outer end of said pipe; a second plug communicating with said second chamber above said first plug; a glass tube connecting said plugs; a third plug communicating with said second chamber below said first plug and also with said plug; an inlet-pipe to said second chamber; a cock for drawing off the oil from said second chamber; and a sight-glass for showing the amount of oil in said chamber, substantially as described.

603,588. ROD-PACKING FOR STEAM-ENGINES. CHARLES LOMBARDI, Yeadon, Pa., assignor to the United States Metallic Packing Company, Philadelphia, Pa. Filed Nov. 2, 1897. Serial No. 657,722. (No model.)

Claim.—1. The combination of a rod, one or more soft-metal packing-rings surrounding the same, a casing having a recess which receives said ring or rings and has an outer wall presenting different degrees of bevel, the forward bevel being the more abrupt, and provision for pressing the packing ring or rings forwardly in said recess, the forward ring being of considerably greater width than the abruptly-inclined portion of the wall of the casing substantially as specified.

2. The combination of a cylinder and piston-rod with an outer set of packings for said rod, and an inner packing which is pressed against a forward seat by the impact of water in the forward end of the cylinder, substantially as specified.

3. The combination of a cylinder and piston-rod, with packing for the latter located within the cylinder and consisting of a ring or rings surrounding the rod, and a spring-supported casing surrounding said rings and having a beveled face for compressing the same when it is moved forwardly against the action of the spring-support, substantially as specified.

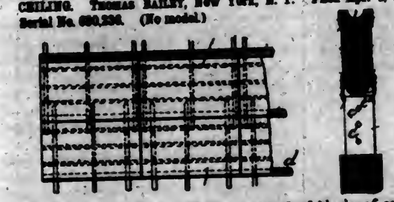
4. The combination of a cylinder and piston-rod, with an outer set of packing-rings for the said rod, and an inner packing bearing against a forward seat and contained in a beveled recess in a sleeve which is acted upon by the impact of water in the forward end of the cylinder, whereby packing-rings are pressed both against the forward seat and against the rod.

5. The combination of a rod and a cylinder-head or other structure having a recess therein, a series of casings contained within said recess and each containing a series of packing-rings, a ring whereby pressure is transmitted from each casing to the packing-rings contained in the casing in advance, a spring-actuated follower for pressing upon the inner ring of the inner casing, and a follower for pressing upon the outer casing of the series, substantially as specified.

608,589. MERRY-GO-ROUND. WILLIAM R. HEMMING, Rockaway Beach, N. Y. Filed May 20, 1897. Serial No. 638,093. (No model.)

Claim.—1. In a merry-go-round, the combination with a central post and a frame mounted to rotate around the same, of rotative ornamental sleeves on the frame, two united cog-rings, mounted to turn around said central post, means for rotating the above-mentioned sleeves from one of said cog-rings and a driving-shaft for rotating the other cog-ring, substantially as herein shown and described.

2. In a merry-go-round, the combination with a central post and a frame mounted to rotate around the same, of hanger-rods on said frame, a circular platform suspended from said hanger-rods, ornamental sleeves mounted to rotate on said hanger-rods and means for rotating said sleeves from the central post, substantially as herein shown and described.



3. In a merry-go-round, the combination with a central post and a frame, mounted to rotate around the same, of hanger-rods on said frame, a circular platform suspended from said hanger-rods, ornamental rotative sleeves on said hanger-rods, ornamental rotative sleeves between the hanger-rods, gearing for rotating the several sleeves and means for operating said gearing from the central post, substantially as herein shown and described.

608,590. COPPER-SMELTING. GEORGE W. RENNE, Kittanning, Pa. Filed Aug. 3, 1897. Serial No. 646,902. (No specimens.)

Claim.—1. In a copper-smelting process, first separating part of the copper from the ore while the ore is in a molten state, and then subjecting the resultant slag to the application or addition thereto of manganese, for the purpose described.

2. A copper-smelting process consisting in first separating part of the copper from the ore while in a molten state, subjecting the resultant slag to the addition of manganese and then removing the bottom portion of the slag and subjecting it to a second smelting process, substantially as described.

608,591. FIREPROOF PARTITION OR OTHER WALL AND CEILING. THOMAS BAILEY, New York, N. Y. Filed Apr. 1, 1897. Serial No. 630,236. (No model.)

Claim.—1. In walls or ceilings composed of blocks of cement or burnt clay, the combination with the edges of said blocks to be joined, of flanged metallic stiffening-strips confined on the edges of said blocks respectively by their flanges overlapping the sides of the blocks, and being tongued and grooved along the middle for interlocking to stiffen the walls or ceilings laterally substantially as described.

2. In walls or ceilings composed of blocks of cement or burnt clay, the combination with the edges of said blocks to be joined, of flanged metallic stiffening strips, confined on the edges of said blocks respectively by their flanges overlapping the sides of the blocks, and being tongued and grooved along the middle for interlocking and bedded on said edges with plaster substantially as described.

3. In walls or ceilings the combination of prepared blocks of cement or burnt clay, said blocks tongued and grooved on the edges to be joined, and a correspondingly tongued-and-grooved metallic laterally-stiffening strip placed between the layers of blocks and said tongued-and-grooved edges and said strips having marginal surfaces in angular relation to the tongues and grooves substantially as described.

4. In walls or ceilings composed of blocks of cement or burnt clay, the combination with said blocks, of metallic strips in the joints adapted for stiffening said joints laterally, and at the ends fastened to the posts, or to sills and floor-beams substantially as described.

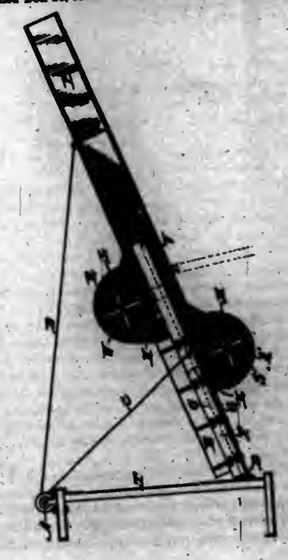
5. In walls or ceilings composed of blocks of cement or burnt clay, the combination with said blocks tongued and grooved on the edges to be joined, of a correspondingly tongued-and-grooved metallic laterally-stiffening strip interposed between and interlocking said edges, and fastened at the ends to posts substantially as described.

6. In walls or ceilings composed of blocks of cement or burnt clay, the combination with said blocks tongued and grooved on the edges to be joined, of a correspondingly tongued-and-grooved longitudinal metallic laterally-stiffening strip interposed between the blocks at each joint, and like transverse strips between the end joints of the blocks and being tongued and notched at the ends to match the longitudinal strips substantially as described.

7. In walls or ceilings composed of blocks of cement or burnt clay, having tongued-and-grooved interlocking edges, the combination with said blocks, of interposed stiffening-bars, and a tongued-and-grooved metallic laterally-stiffening strip, interposed between the blocks at the joints, said stiffening-bars projecting at the edges of the blocks and through the stiffening-strips into the adjacent blocks substantially as described.

8. In ceilings composed of blocks of cement or burnt clay having tongued-and-grooved interlocking edges, the combination with said blocks of interposed stiffening-bars, a tongued-and-grooved metallic laterally-stiffening strip interposed between the blocks at the joints, and suspending hanger-rods connected with the interposed stiffening-bars substantially as described.

608,592. VALVE. REXWELL H. DOUGHERTY, Evanston, Ill. Filed Oct. 7, 1897. Serial No. 654,621. (No model.)



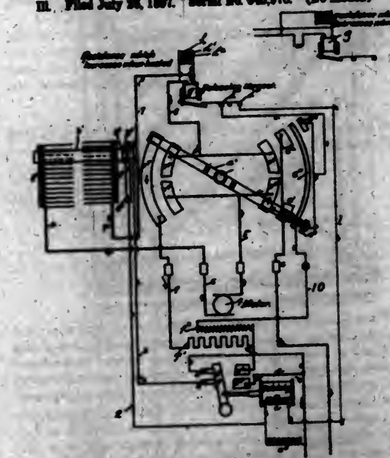
Claim.—1. In a gas-meter valve in combination with the shaft E, the flexible surface G, cushion H, and metallic back K, substantially as described.

2. In a gas-meter valve in combination with the shaft E, provided with the nuts F F' and washers *f f'* the flexible surface G, cushion H, and metallic back K, substantially as described and for the purpose set forth.

3. A double valve for gas-meters, consisting of the combination of the shaft E, the flexible surfaces G G, cushions H H, and metallic plate K, substantially as described.

608,593. PNEUMATIC STACKER. WILLIAM H. COOK, Winfred, S. D., assignor to The Indiana Manufacturing Company, Indianapolis, Ind. Filed Dec. 28, 1896. Serial No. 617,255. (No model.)

Claim.—1. A pneumatic pipe conveyer, combined with an endless apron and two fans one located above and the other below the end of the elevator-apron substantially as and for the purpose described.



2. A pneumatic straw-stacker having an endless elevator-apron, a pneumatic pipe conveyer, and a rotary fan delivering a current of air into the same said fan having a ratchet-clutch connection with its driving mechanism to permit the fan to continue its revolution unimpeded by the retardation of the driving mechanism substantially as described.

3. A pneumatic pipe conveyer, combined with an endless elevator-apron, two rotary fans, one located above and the other below the outer end of the elevator-apron, gears connecting the two fans, and a fly-wheel regulating their motion substantially as and for the purpose described.

4. The combination with a hinged trough-shaped frame, of an endless-apron elevator, a pipe conveyer, and fans and fan-casings arranged at the outer end of the trough-shaped frame, and means for sustaining and adjusting these devices as to inclination substantially as described.

5. The combination of the trough-shaped frame, and its endless-apron elevator, the double fan-casings R S having inlet-openings next to the elevator-apron, a pipe conveyer communicating with the opposite side of said casings, and two rotary fans arranged one above and the other below the end of the revolving apron substantially as and for the purpose described.

608,594. TIME-LIMIT CUT-OUT. HENRY H. CUTLER, Chicago, Ill. Filed July 26, 1897. Serial No. 645,970. (No model.)

Claim.—1. In combination the active coil of a cut-out and a time-limit controlling the same and comprising a section of an electric circuit the resistance of which varies with rise of temperature due to the current, substantially as described.

2. In combination the active coil, of a cut-out and a time-limit comprising a section of an electric circuit the resistance of which increases with rise of temperature due to the current, said section being in shunt with said active coil, substantially as described.

3. In combination the active coil of a cut-out and a time-limit comprising a section of circuit the resistance of which increases with rise of temperature, placed in shunt with said active coil and a section of circuit the resistance of which decreases with rise of temperature in series with said active coil, substantially as described.

4. In combination a retaining-electromagnet for a cut-out, a releasing-electromagnet therefor, and a time-limit controlling the releasing-magnet and comprising a section of an electric circuit the resistance of which varies with rise of temperature due to the current, substantially as described.

5. In combination a retaining-electromagnet for a motor cut-out included in a shunt-circuit, a releasing-electromagnet in the armature-circuit, and a time-limit controlling the releasing-electromagnet and comprising a section of an electric circuit the resistance of which varies with rise of temperature due to the current, substantially as described.

6. In combination an electric motor operating an elevator-car, an elevator-controlling switch a cut-out therefor and a time-limit for controlling the cut-out, and comprising a section of an electric circuit the resistance of which varies with rise of temperature due to the current whereby the cut-out permits the momentary flow of a large starting-current while responding to a small prolonged current, substantially as described.

7. In combination an electric motor operating an elevator-car, an elevator-controlling switch, a cut-out therefor and a time-limit for controlling the cut-out and comprising a section of an electric circuit the resistance of which varies with rise of temperature due to the current, substantially as described.

8. The combination with a circuit to be controlled, of a circuit-controlling arm or element therein, an electromagnet for controlling said arm or element and a time-limit cut-out operated by the heating effect of the current and controlling the circuit through said electromagnet to thereby control said circuit-controlling arm, substantially as described.

9. The combination with a circuit to be controlled, of a circuit-controlling arm or element therein, a retaining-electromagnet for normally holding said arm or element in position to close said circuit, means for moving said arm or element when released to open said circuit and a time-limit device operated by the heating effect of the current and controlling the circuit through said electromagnet to effect the release of said circuit-controlling arm, substantially as described.

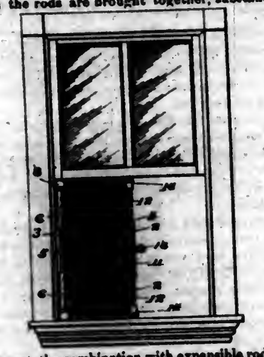
10. The combination with a circuit to be controlled, of a circuit-controlling arm or element therein, a retaining-electromagnet for normally holding said arm or element in position to close said circuit, means for moving said arm or element when released to open said circuit, a releasing-electromagnet for controlling said retaining-electromagnet, and a time-limit device operated by the heating effect of the current and controlling the circuit through said releasing-electromagnet, substantially as described.

11. The combination with an electric motor, of a cut-out having a circuit-controlling arm or element a retaining-electromagnet for normally holding the arm in position and included, in a circuit in shunt with the motor-armature, and a releasing-electromagnet included in series with the motor-armature, and a time-limit device operated by the heating effect of the current and acting upon the releasing-electromagnet to effect the release of the arm after an excessive current has flowed for a predetermined interval of time, substantially as described.

12. In an elevator-controller, the combination with a series of rheostat-terminals arranged equidistant in a straight line and situated in a vertical plane, of a contact arm or bar movable vertically across said terminals and descending by gravity, and a heart-shaped cam arranged to raise the contact-bar through equal distances for substantially equal angles through which the cam is rotated, substantially as described.

13. In an elevator-controller the combination with a series of rheostat-terminals arranged in a vertical plane on one face of a rheostat-box, of a vertically-moving gravity contact-bar, a shaft extending through said box, a heart-shaped cam thereon for raising said contact-bar, and a reversing-switch on the opposite face of said box operated by the rotation of said shaft, substantially as described.

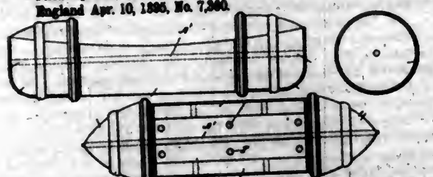
14. In a cut-out, a retaining-electromagnet included at starting in a local circuit through a pair of separable contacts and a switch arranged to be closed only when the rheostat resistance is in circuit, means for separating said separable contacts upon the energizing of said magnet and for closing the motor-circuit and including a resistance in the circuit of said magnet, and a releasing-magnet for de-energizing said retaining-magnet, substantially as described.



15. The combination with an electric motor, of a rheostat in circuit with the armature thereof, a switch in the circuit of said motor, a magnet for controlling said switch placed in a circuit in shunt with said armature, and a switch in the circuit of said magnet operated by the movable element of the rheostat and arranged to be closed only when the starting resistance of the rheostat is in the armature-circuit, substantially as described.

608,595. FLY-SCREEN. SARA C. HARZ, Galveston, Tex. Filed Mar. 30, 1897. Serial No. 629,431. (No model.)

Claim.—1. The combination with a rod comprising two cylindrical portions containing springs, and an intermediate rod portion movably mounted in said tubular portions and engaging said springs, of another rod comprising a tubular portion containing a spring, rods mounted in said tubular portion with their ends bearing against said spring, antifriction-rollers on the ends of said latter rods, and a flexible netting connecting said rods, substantially as described.



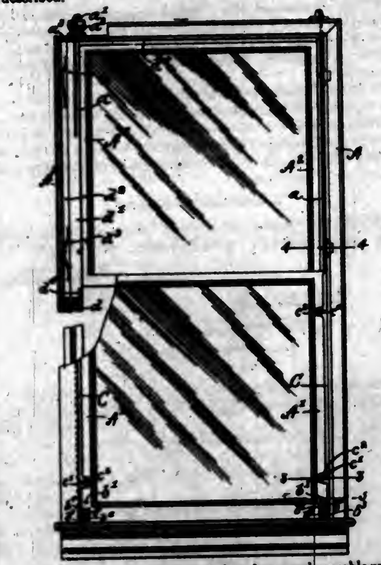
2. The combination with a rod comprising two spaced tubes containing springs and having flexible caps at their outer ends, of a rod having its ends movably mounted in said tubes and engaging said springs, another rod comprising a central tubular portion containing a spring, rods having their opposite ends mounted in said tubular portion and engaging said spring, antifriction-rollers mounted on the

outer ends of said latter rods, a flexible netting connecting said rods, and elastic contracting means mounted on said netting for contracting the same when the rods are brought together, substantially as described.

3. In a fly-net, the combination with expansible rods one of said rods having antifriction-rollers mounted upon its opposite ends, of a flexible netting connecting the said rods, substantially as described.

608,596. LIFE-BOAT. EDWARD J. HOUSE, London, England. Filed Apr. 21, 1897. Serial No. 633,161. (No model.) Patented in England Apr. 10, 1895, No. 7,360.

Claim.—In a life-boat, the combination with conical buoyant end sections provided with outwardly-extended flanges adapted to roll as wheels on the deck of the vessel; of a shaft rigidly mounted in said sections and extended between the same; and a boat-body adapted to hold passengers and pivotally suspended from said shaft so as to be lifted above the bottom of the said end section substantially as described, whereby the boat may be rolled off the vessel as on wheels while containing passengers.



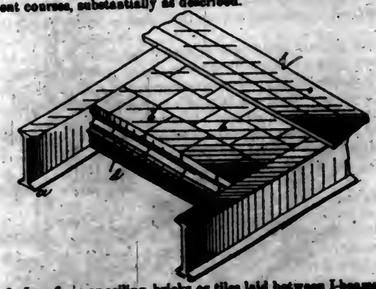
608,597. WINDOW FRAME AND SASH. ELLA M. KITTREDGE and MICHEL WALKER, Chicago, Ill. Filed July 22, 1897. Serial No. 645,608. (No model.)

Claim.—1. The combination with a movable window-sash, of drums revolubly mounted in said sash, sash-cords, one end of each of which is attached to said drums, traction-wheels secured to said drums which run in contact with the window-casing, whereby movement of said sash will impart rotation to said drums, and means to secure said drums against rotation, substantially as described.

2. The combination with movable window-sashes, of shafts revolubly mounted in said sashes, drums secured to said shafts, traction-wheels likewise secured to said shafts, which run in contact with the window-casing, sash-cords, one end of each of which is secured to the upper sash and the other ends of which are attached to the drums mounted in the lower sash, the ends of said shafts projecting from said sash and being squared, and slotted, longitudinally-movable plates secured to said window-sash, in such position that movement thereof in the proper direction will cause the slots therein to engage the squared heads of said shafts and secure said shafts against rotation, substantially as described.

3. The combination with a window-frame and movable upper and lower window-sashes, of grooves formed in the sides of said window-frame, strips or stop-plates secured to the lower sash by means of clamping or binding screws, which pass through transverse slots formed in said strips or stop-plates, said strips or stop-plates being adapted to be moved outwardly into engagement with said grooves and to be retracted out of engagement therewith, the parting-strips of said window-frame comprising upper sections, fitted to and adapted to be depressed into grooves or slots formed in the sides of said window-frame, springs applied to the rear sides of said movable sections of said parting-strips and adapted to maintain the same normally advanced or extended, and stops to limit the movement of said movable sections under the influence of said springs, substantially as described.

4. The combination with a window-frame and movable upper and lower window-sashes, of grooves formed in the sides of said window-frame, strips or stop-plates secured to the lower sash by means of clamping or binding screws, which pass through transverse slots formed in said strips or stop-plates, said strips or stop-plates being adapted to be moved outwardly into engagement with said grooves and to be retracted out of engagement therewith, the parting-strips of said window-frame comprising upper sections fitted to and adapted to be depressed into grooves or slots formed in the sides of said window-frame, springs applied to the rear sides of said movable sections of said parting-strips and adapted to maintain the same normally advanced or extended, stops to limit the movement of said movable sections under the influence of said springs and sash cords attached adjacent to the bottoms of said upper and lower sashes, substantially as described.

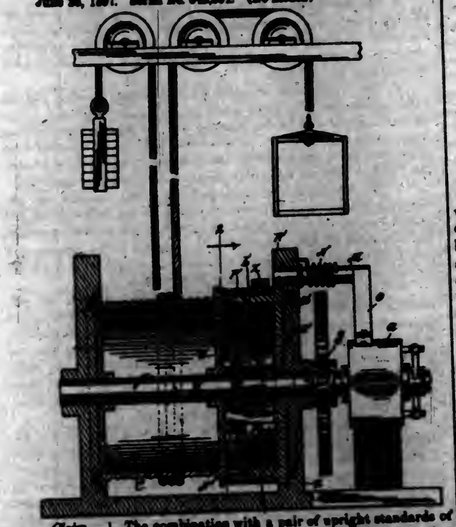


5. The combination with a window-frame and movable upper and lower window-sashes, of guide-grooves formed in the sides of said window frame or casing, stripe or stop-plates secured to the lower window-sash and adapted to be moved outwardly into engagement with said grooves and adapted to be withdrawn from engagement therewith, the parting-strips of said window-frame comprising upper sections fitted to and adapted to be depressed into grooves or slots formed in the sides of said window-frame, springs applied to said movable sections of said parting-strips and adapted to maintain the same normally advanced or extended, stops to limit the movement of said movable sections of said parting-strips under the influence of said springs and bolts or pins adapted to secure said movable sections of said parting-strips in depressed position, substantially as described.

6. The combination with a window frame or casing and movable upper and lower sashes, of grooves formed in the sides of said window frame or casing, strips or stop-plates secured to the lower window-sash and adapted to be moved outwardly into engagement with said grooves and to be retracted from engagement therewith, the parting-strips of said window-frame comprising upper sections fitted to and adapted to be depressed into grooves or slots formed in the sides of said window-frame, means to secure said movable sections of said partisg-strips in advance or extended position, drums revolubly mounted in the lower sash, traction-wheels secured to said drums, which run in contact with the window-casing and impart rotary movement to said drums when said sash is raised or lowered, sash-cords, the corresponding ends of each of which are attached to the drums mounted in said lower sash, and the opposite ends of which are attached to the upper sash, and pulleys supported at the top of said window-frame over which said sash-cords pass, substantially as described.

608,598. FIREPROOF FLOOR AND CEILING. GUSTAV LEBIAN, Maurer, N. J. Filed Sept. 3, 1896. Serial No. 605,108. (No model.)

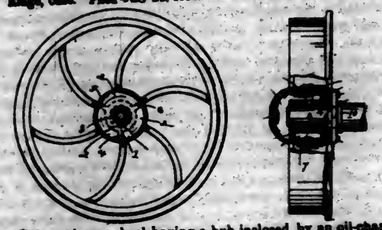
Claim.—1. In a floor or ceiling, bricks or tiles laid between I-beams having side recesses adapted to coincide with the recesses in the tiles of the next course, in combination with metallic ties located in the dividing-line of said course above and out of contact with the lower flange of the I-beams and entering the recesses in the tiles on adjacent courses, substantially as described.



2. In a floor or ceiling, bricks or tiles laid between I-beams and having appropriately-shaped side recesses adapted to coincide with the recesses in the tiles of the next course, in combination with T-iron ties located within the coincident recesses and above and out of contact with the lower flanges of the I-beams, substantially as described.

3. In a floor or ceiling, bricks or tiles laid between flanged floor-beams and having side recesses adapted to coincide with the recesses in the tiles of the next course, in combination with metallic ties embedded in mortar and located in the dividing-line of said courses above the lower flanges of the floor-beams, and entering the recesses of two adjacent courses, substantially as described.

4. A floor or ceiling composed of bricks or tiles having appropriately-shaped side recesses between the upper and lower surfaces of said bricks or tiles, and a metal tie located wholly within said recesses above and out of contact with the support for said ceiling or floor, substantially as set forth.



608,599. DRUM-WIRE ELEVATOR. ALEXANDER B. ROBEY, Chicago, Ill., assignor to himself, and James Robey, Pittsburg, Pa. Filed June 30, 1897. Serial No. 643,201. (No model.)

Claim.—1. The combination with a pair of upright standards of a driving-shaft journaled in said standards, a winding-drum mounted loosely on said shaft and having one end adapted to bear against one of said standards, a spiral cam projecting from the opposite end of said drum, the spiral of said cam ending in a shoulder, lugs projecting from said drum and adapted to be engaged by said radial arms, a cam loose on said shaft and having a spiral end facing the spiral end of said drum and ending in a shoulder, said cam having its opposite end adapted to bear against one of said standards, the shoulders of said spirals being adapted to engage each other, a series of antifriction-balls between said spirals, said series forming a complete, continuous circuit extending around said shoulders, and lugs on said cam adapted to be engaged by said radial arms, substantially as described.

2. The combination with a pair of upright standards of a driving-shaft journaled in said standards, a winding-drum and a cam, both loosely mounted on said shaft adjacent to each other, means whereby said drum and cam are separated and made to bear against said standards when the rotation of the driving-shaft is stopped and are brought together and released from said standards when said shaft is rotated in either direction, and a brake adapted to bear on said cam when the rotation of said shaft is stopped, substantially as described.

608,600. CAR-WHEEL. WILLIAM W. ROSSITER, Mineral Ridge, Ohio. Filed July 21, 1897. Serial No. 645,304. (No model.)

Claim.—A car-wheel having a hub inclosed by an oil-chamber, and a seat in the inner face of the hub, in combination with the wheel-axle provided with two collars, one of said collars being adapted to be fitted in the said seat in the hub, and a pair of key-plates adapted to enter between the two collars, said key-plates being attached to the car-wheel by means of screws, substantially as shown and described.

608,601. ENGINE. WILLIAM H. BEEMAN, Ashland, Wis., assignor of one-half to George B. Rinehart, same place. Filed Feb. 18, 1897. Serial No. 624,074. (No model.)

Claim.—1. The combination of a valve-chamber having a seat with a number of equidistant admission-ports and a number of equidistant exhaust-ports arranged in circular series, the exhaust-ports being nearer to the admission-ports on one side than on the other, and a rotary valve having a number of equidistant ports arranged and spaced to correspond with the admission and exhaust ports in the valve-seat, said valve consisting of an expansible ring severed on one side through one of its ports, substantially as and for the purposes set forth.

2. The combination of a cylindrical valve-seat having admission and exhaust ports, a rotary ring-shaped valve severed on one side and having ports in its periphery arranged to register with the ports in the valve-seat, a spindle fitted to turn in the wall of the valve-chamber through which it projects and provided with a projection which loosely engages with said valve and means for turning said spindle, substantially as and for the purposes set forth.

3. The combination of a cylindrical valve-seat having a number of admission-ports equidistant from each other and communicating with a common supply-passage, and a number of similarly-spaced exhaust-ports and a ring-shaped valve having a number of ports extending completely across its periphery and spaced to correspond with the admission and exhaust ports in said seat, one of the valve-ports severing the ring and rendering it contractible and expansible, and the parts of said ring between its other ports being connected by inwardly-projecting bridge-pieces, substantially as and for the purposes set forth.

4. The combination with an engine-cylinder, of a cylindrical valve-seat inserted therein and having a number of admission and exhaust ports communicating respectively with supply and exhaust passages encircling said seat, a rotary annular valve fitted to turn in said seat and formed in its periphery with a number of equidistant ports spaced to correspond with the spacing of the admission and exhaust ports respectively in the valve-seat, the exhaust-ports in the

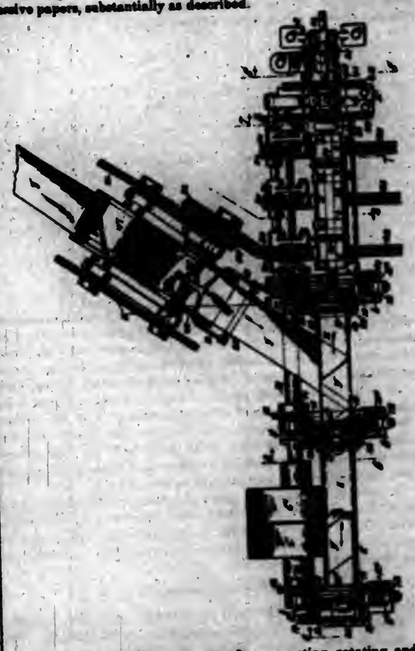
valve-seat being nearer the admission-ports on one side than on the other, and so arranged that all the exhaust-ports will register with ports in the valve at every fourth stroke of the piston, and all the admission-ports will register with ports in the valve on the next succeeding stroke of the piston, and means for turning said valve continuously in one direction, substantially as and for the purposes set forth.

5. The combination with an engine-cylinder provided with a cylindrical valve-seat and supply and exhaust passages encircling said seat, and each communicating with the cylinder through a number of equidistant ports in said seat, of an expansible annular valve fitted to turn in said seat and having a number of ports in its periphery arranged to register alternately with the admission and exhaust ports in said seat, means for turning said valve continuously in one direction, the exhaust-ports in the valve-seat being nearer the admission-ports on one side than on the other, and so arranged that all the exhaust-ports will register with valve-ports at every fourth stroke of the piston, all the admission-ports will register with valve-ports on the next succeeding stroke of the piston, and both exhaust and admission ports will be closed during two intervening strokes of the piston, and a passage around the cylinder communicating on one side thereof with the supply-passage to the admission-ports and having at its ends on the opposite side of the cylinder air and gas or vapor supply connections, substantially as and for the purposes set forth.

6. The combination with an engine-cylinder or valve-chamber provided with a cylindrical valve-seat and supply and exhaust passages, each communicating with said cylinder or chamber through a number of ports in said seat, of a rotary annular valve having a number of ports in its periphery arranged to register with the admission and exhaust ports alternately opening the exhaust-ports on every fourth stroke and the admission-ports on the next succeeding stroke of the piston, a spindle loosely connected with said valve and having a conical enlargement fitting a corresponding recess in the inner wall of the cylinder-head or valve-chamber, a spring tending to hold said conical enlargement snugly seated in said recess, and means for turning said spindle, substantially as and for the purposes set forth.

7. The combination with an engine-cylinder provided with a cylindrical valve seat and supply and exhaust passages each communicating with said cylinder through ports in said seat, a piston and a crank-shaft, of an expansible annular valve fitted to turn in said seat and having ports in its periphery arranged to register alternately with the admission and exhaust ports in said seat, said valve being severed through one of its ports, a spindle passing through the cylinder and having a self-adjusting connection with said valve, whereby the valve is turned and allowed to adapt itself to its seat by expansion or contraction, and a lay-shaft connected with said spindle by gears and with said crank-shaft by a worm and worm-gear, substantially as and for the purposes set forth.

8. The combination with an engine-cylinder, piston and crank-shaft of an annular valve-seat having a number of admission and exhaust ports, the spaces between the several admission-ports and between the several exhaust-ports being alike, while the space between the adjacent admission and exhaust ports is different, a rotary valve fitted to said seat and having a number of ports equidistant from each other and spaced to correspond with the spacing of the admission and exhaust ports in the valve-seat, and actuating connections between said valve and crank-shaft whereby a number of revolutions of the crank-shaft equal to twice the number of ports in the valve produce one revolution of the valve, substantially as and for the purposes set forth.



608,602. WRAPPING-MACHINE. LUTHER C. CROWELL, Brooklyn, N. Y., assignor to Robert Hoe, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Aug. 13, 1897. Serial No. 648,098. (No model.)

Claim.—1. The combination of means for supporting and advancing a succession of independent papers, and means for winding a succession of wrappers spirally about the successive papers as they are advanced, substantially as described.

2. The combination of means for supporting and advancing a succession of independent papers, means for delivering the papers successively to said supporting and advancing means, and means for winding a succession of wrappers spirally about the successive papers as they are advanced, substantially as described.

3. The combination of means for supporting and advancing a succession of independent papers, means for winding a succession of wrappers spirally about the successive papers as they are advanced, and pasting devices for applying a line of paste to one edge of the wrappers for securing together the successive windings of the wrappers, substantially as described.

4. The combination of means for supporting and advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

5. The combination of means for supporting, rotating and advancing a succession of independent papers, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

6. The combination of means for supporting, rotating and advancing a succession of independent papers, means for guiding a continuous wrapper-web to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, and means for severing the wrapper tube at or near the junction between successive papers, substantially as described.

7. The combination of means for supporting, rotating and advancing a succession of independent papers, means for delivering the papers successively to said supporting, rotating and advancing means, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

8. The combination of means for supporting, rotating and advancing a succession of independent papers, means for delivering the papers successively to said supporting, rotating and advancing means, means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, and pasting devices for applying a line of paste to one edge of the wrappers for securing together the successive windings of the wrappers, substantially as described.

9. The combination of means for supporting, rotating and advancing a succession of independent papers, devices for advancing the papers in a direction transverse to the direction in which they are fed by said supporting, rotating and advancing means and delivering the papers successively to said supporting, rotating and advancing means, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

10. The combination of means for supporting, rotating and advancing a succession of independent papers, a rotary pocket from which the papers are delivered longitudinally to said supporting, rotating and advancing means, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

11. The combination of means for supporting, rotating and advancing a succession of independent papers, a rotary pocket, feeding devices for advancing the papers successively into said pocket transversely to the axis of rotation of the pocket, means for advancing the papers longitudinally of said axis from the pocket to said paper supporting, rotating and advancing means, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

12. The combination of means for supporting, rotating and advancing a succession of independent papers, a rotary pocket, feeding devices for advancing the papers successively into the pocket transversely to the axis of rotation of the pocket, a pusher for advancing the papers longitudinally of said axis from the pocket to said paper supporting, rotating and advancing means and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

13. The combination of means for supporting, rotating and advancing a succession of independent papers, a rotary pocket, feeding devices for advancing the papers successively into the pocket transversely to the axis of rotation of the pocket, a pusher for advancing the papers longitudinally of said axis from the pocket to said paper supporting, rotating and advancing means and advancing the papers faster than they are advanced by said paper supporting, rotating and advancing means, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

14. The combination of means for supporting, rotating and advancing a succession of independent papers, a rotary pocket from which the papers are delivered to said supporting, rotating and advancing means, feeding devices for advancing the papers successively to the pocket transversely to the axis of rotation of the pocket, feeding-tapes for completing the feeding of the papers into the pocket, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

15. The combination of a rotary pocket, feeding devices for advancing papers successively into the pocket transversely to the axis of rotation of the pocket, and means for advancing the papers longitudinally of said axis from the pocket, substantially as described.

16. The combination of a rotary pocket having a long side *f* and a short side *e*, feeding devices for advancing the papers successively into the pocket transversely to the axis of rotation of the pocket, and feeding-tapes 24 engaging the paper on the side of the pocket having the short side *e* to complete the feeding of the papers into the pocket, substantially as described.

17. The combination with a pair of feeding-rolls *a* mounted in a rotating frame, of a rotary pocket whose axis of rotation coincides with the axis of rotation of said frame, and a rotary pusher for advancing a paper longitudinally of said axis from the pocket to said feeding-rolls, substantially as described.

18. The combination of the rotary pocket 25, feeding-tapes 23 and 24 running transversely to the axis of rotation of the pocket, the feeding-tapes 24 being extended beyond the pocket to complete the feeding of papers into the pocket, and means for advancing the papers longitudinally of said axis from the pocket, substantially as described.

19. The combination of the rotary pocket 25 formed in sections, feeding devices for advancing papers into the pocket transversely to the axis of rotation of the pocket, feeding-tapes 24 extending between the sections of the pocket to complete the feeding of the papers into the pocket, and means for advancing the papers longitudinally of said axis from the pocket, substantially as described.

20. The combination of the rotary pocket 25, feeding devices for advancing papers into the pocket transversely to the axis of rotation of the pocket, a guide 27, and means for advancing the papers longitudinally of said axis from the pocket, substantially as described.

21. In a machine for wrapping newspapers and similar articles, the combination of exterior paper feeding devices for advancing a succession of independent papers, and means for winding a succession of wrappers spirally about the successive papers as they are advanced, substantially as described.

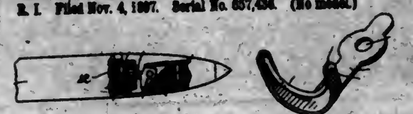
22. In a machine for wrapping newspapers and similar articles, the combination of exterior paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, and means for severing the wrapper-tube at or near the junction between successive papers, substantially as described.

23. In a machine for wrapping newspapers and similar articles, the combination of rotating exterior paper-feeding devices for advancing a succession of independent papers, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers at an angle to spirally wind the wrappers about the papers, substantially as described.

24. In a machine for wrapping newspapers and similar articles, the combination of a set of rotating exterior feeding devices for advancing a succession of independent papers to the wrapping-point, a set of rotating exterior feeding devices for advancing the wrapped papers from the wrapping-point, and means for guiding a succession of wrappers to the rotating and longitudinally-advancing papers between said feeding devices and at an angle to spirally wind the wrappers about the papers, substantially as described.

25. The combination of paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, and means for perforating the wrapper-web on lines diagonal to the length of the web and at right angles to the line of movement of the papers to form perforated lines in the wrapper-tube at or near the junction between successive papers, substantially as described.

26. The combination of paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, means for perforating the wrapper-web on lines diagonal to the length of the web and at right angles to the line of movement of the papers to form perforated lines in the wrapper-tube at or near the junction between successive papers, and means for severing the wrapper-tube on said perforated lines, substantially as described.



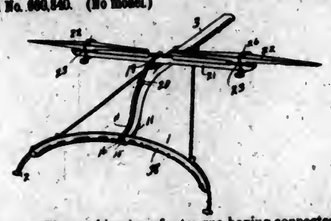
27. The combination of paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally-wound wrapper-tube inclosing the papers, pasting devices for applying a line of paste to one edge of the wrapper-web for securing together the successive windings of wrapper forming the wrapper-tube, means for perforating the wrapper-web on lines diagonal to the length of the web and at right angles to the line of movement of the papers to form perforated lines in the wrapper-tube at or near the junction between successive papers, and means for severing the wrapper-tube on said perforated lines, substantially as described.

28. The combination of paper-feeding devices for advancing a succession of independent papers, means for winding a continuous wrapper-web about the papers as they are advanced to form a continuous spirally wound wrapper-tube inclosing the papers, means for perforating the wrapper-web on lines diagonal to the length of the web and at right angles to the line of movement of the papers to form perforated lines in the wrapper-tube at or near the junction between successive papers, and feeding devices feeding the wrapped papers at an increased speed to break the wrapper-tube on the perforated lines, substantially as described.

29. The combination of paper feeding and rotating devices for advancing a succession of independent papers, and feeding-rolls 47 and 48 for advancing a continuous wrapper-web to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, one of said rolls being provided with a diagonal perforating-strip for perforating the wrapper-web in a line at right angles to the line of feed of the papers to form perforated lines in the wrapper-tube at or near the junction between successive papers, substantially as described.

30. The combination of paper feeding and rotating devices for advancing a succession of independent papers, and feeding-rolls to the rotating and longitudinally-advancing papers at an angle to form a continuous spirally-wound wrapper-tube about the papers, and a tension and take-up device engaging the wrapper-web as it advances to the papers, substantially as described.

608,603. LOOM-SHUTTLE. STEPHEN M. HAMLIN, Taunton, Mass., assignor of three-fourths to William H. Goldsmith, Central Falls, R. I. Filed Nov. 4, 1897. Serial No. 657,436. (No model.)



Claim.—1. The improved bobbin-retaining device consisting of the depending bail or loop, combined with the support consisting of the strip fitted for application to a shuttle-body and provided with the opposite vertically-projecting arms to which the opposite ends of the said bail or loop are journaled or pivoted to render it self-adjusting and capable of conforming itself to the position and movement of the portion of the bobbin-head with which it coacts, substantially as described.

2. The improved bobbin-retaining device consisting of the depending bail or loop, combined with the support consisting of the strip fitted for application to a shuttle-body, provided with the opposite vertically-extending arms to which the opposite ends of the said bail or loop are journaled or pivoted to remove the bail or loop self-adjusting and capable of conforming itself to the position and move-

ment of the portion of the bobbin-head with which it coacts, the said strip having the hole therethrough for the passage of a securing-screw, substantially as described.

603,604. CARRIAGE-TONGUE. JOHN HOWELL, Canton, Ohio, assignor of one-third to Urban B. Benner, same place. Filed Dec. 6, 1897. Serial No. 660,840. (No model.)

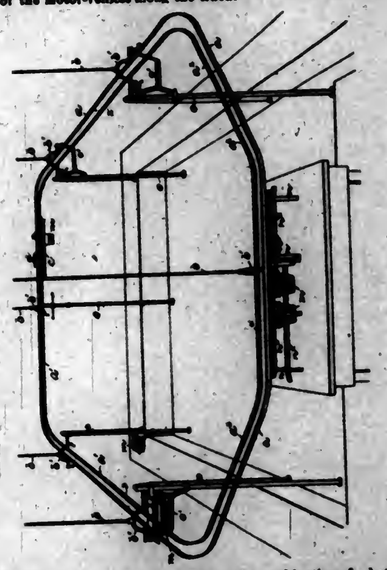
Claim.—1. The combination of a tongue having connected to its rear end a bow, brace-rod 6, pivotally connected at their front and rear ends, stay-braces 8, provided with slotted ends, a strap-iron secured to the rear end of the tongue, a bar 12, provided with an angled portion and a screw-threaded bolt connected to the angled portion of the bar 12, substantially as and for the purpose specified.

2. The combination of the doubletree 21 having pivotally attached thereto the whiffletrees 22, a clevis having one of its members connected to the strap-bar, and the other member to the doubletree, substantially as and for the purpose specified.

3. The combination of the tongue 3, having connected thereto the iron strap 11, the hammer-strap adjustably connected to the upper member of the strap 11, a bow connected to the rear end of the tongue, and the bar 12, seated in a recess at the rear end of the tongue, substantially as and for the purpose specified.

603,605. PNEUMATIC TIRE. LEANDER D. JUNKINS, Somerville, Mass. Filed Mar. 16, 1897. Serial No. 627,866. (No model.)

Claim.—1. A pneumatic tire comprising an inner, endless, inflatable tube of rubber, a half-tube of leather exteriorly thereof, and an outer tube of rubber, or rubber compound formed with grooves and lips on its rim side, within its outer circle and united by stitches passed through the lips, substantially as described.



2. A pneumatic tire comprising an inner, endless, inflatable tube of rubber, an exterior half-tube of leather on the outer surface thereof, and united thereto, and an outer tube or cover of rubber or rubber compound formed with grooves and lips on its rim side within its outer circle and united by stitches passed through the lips, substantially as described.

3. A pneumatic tire, comprising an inner, endless, inflatable tube of rubber, a half-tube of leather on its outer surface, the leather half-tube having its ends united by a seam covered with rubber and vulcanized, and an exterior cover, substantially as described.

608,606. ELECTRIC CONVEYING SYSTEM. ALVARO S. KNOTS, Springfield, Ohio, assignor to Oliver S. Kelly, same place. Filed Dec. 2, 1897. Serial No. 660,541. (No model.)

Claim.—1. In an electric conveying system, the combination of a battery or other source of electrical supply, track conductors, one connected with one pole of the latter, a plurality of terminals stationed along a continuous stretch of the other track conductor and all connected with the other pole of the battery, and automatically-opening circuit-closers to connect said terminals respectively with said latter track conductor.

2. In an electric conveying system, the combination of a battery or other source of electrical supply, track conductors, one connected with one pole of the latter, a plurality of terminals stationed along a continuous stretch of the other track conductor and all connected with the other pole of the battery, circuit-closers to connect said terminals respectively with said latter track conductor, and means for effecting automatic displacement of said circuit-closers by the traverse of the motor-vehicle along the track.

3. In an electric conveying system, the combination of a battery or other source of electrical supply, track conductors, one connected with one pole of the latter, a plurality of terminals stationed along a continuous stretch of the other track conductor and all connected with the other pole of the battery, automatically-opening circuit-closers to connect said terminals respectively with said latter track conductor, and an additional connection between the same and the battery having a manually-controlled switch, substantially as and for the purpose described.

4. In an electric conveying system, the combination of a battery or other source of electrical supply, track conductors, one connected with one pole of the latter, a plurality of terminals stationed along a continuous stretch of the other track conductor and all connected with the other pole of the battery, circuit-closers to connect said terminals respectively with said latter track conductor, means for effecting automatic displacement of said circuit-closers by the traverse of the motor-vehicle along the track, and an additional connection between the same and the battery having a manually-controlled switch, substantially as and for the purpose described.

5. In an electric conveying system, the combination of a continuous track conductor, a sectional track conductor, a rheostat whose end contact-points are independently connected with sections of the sectional track conductor, a battery or other source of electrical supply, and connections between the poles of the latter and the rheostat and continuous track conductor respectively.

6. In an electrical conveying system, the combination of a track composed of a rail or member which is a continuous conductor of electricity, and a rail which is in sections insulated from each other, a battery or other source of supply of electricity, an electrical connection between one pole of said battery and the continuous rail, with an interposed switch, a rheostat, an electrical connection between the other pole of the battery and the movable member of the rheostat, separate electrical connections between the end contact-points of the latter and the sections of the sectional rail, one or more cut-outs at one or more stations along the track, and a conveying-motor traveling in electrical contact with both track-rails.

7. In an electrical conveying system, the combination of a track composed of a rail or member which is a continuous conductor of electricity, and a rail which is in sections insulated from each other, a battery or other source of supply of electricity, an electrical connection between one pole of said battery and the continuous rail, with an interposed switch, a rheostat, an electrical connection between the other pole of the battery and the rheostat, separate electrical connections between the latter and the sections of the sectional rail, one or more cut-outs at one or more stations along the track, an electrical connection between the rheostat and the sectional rail independent of said cut-outs and itself having a cut-out, and a conveying-motor traveling in electrical contact with the track-rails.

8. In an electrical conveying system, the combination of an elevated track conductor of electricity, a conveying-motor running in electrical contact therewith, an electric circuit embracing the track conductor and motor, one or more elevators stationed along the track and having means for closing said circuit, and one or more carriers for transfer between the elevator and the motor.

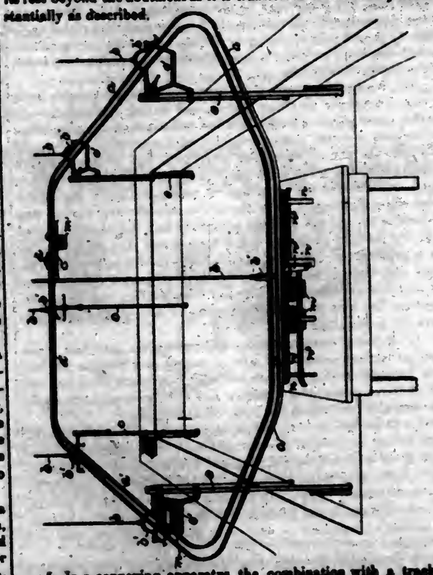
9. In an electrical conveying system, the combination of a track composed of a rail or member which is a continuous conductor of electricity, and a rail which is in sections insulated from each other, a battery or other source of supply of electricity, an electrical connection between one pole of said battery and the continuous rail, with an interposed switch, a rheostat, an electrical connection between the other pole of the battery and the rheostat, separate electrical connections between the end contact-points of the latter and the sections of the sectional rail, including terminals at stations along the track, one or more elevators having circuit-closers to make contact with said terminals, and a conveying-motor running on the track in electrical contact therewith.

10. In an electrical conveying system, the combination with a track or way, a traveling motor thereon and an electric circuit embracing the same; of an elevator having means for closing said circuit, and a carrier adapted to lodge in said elevator, or on said motor, the motor and carrier having provisions for engagement whereby the latter may be sustained and conveyed by the former, and suitable stop and trip devices being provided whereby the carrier may be automatically transferred between the motor and elevator.

11. In an electrical conveying system, the combination with a track or way, a traveling motor thereon, and an electric circuit embracing the same; of an elevator having means for closing said circuit, and a carrier adapted to lodge in said elevator, or on said motor, the motor and carrier having provisions for engagement whereby the latter may be sustained and conveyed by the former, and suitable stop and trip devices being provided whereby the carrier may be automatically transferred between the motor and elevator, and also lodged at a receiving-station having stop and trip devices.

12. In an electrical conveying system, the combination with a track conductor, a conveying-motor in electrical contact therewith, and an electric circuit embracing the track conductor and motor and having terminals at one or more stations along the track; of one or more elevators at such stations and carrying circuit-closers for contact with the said terminals when the elevator is raised, and one or more carriers adapted to be automatically transferred between the conveying-motor and the elevator or elevators, suitable stop and trip devices being provided for this purpose.

13. In an electric conveying system, the combination of a normally open track-circuit having terminals in one or more pairs, one or more elevators having circuit-closers to contact with the said terminals, detent mechanism to sustain the elevator in circuit-closing position, a track, a motor-vehicle thereon having means for tripping said detent mechanism, and a holder for transfer between the vehicle and the elevator.



608,607. CONVEYING APPARATUS. ALVARO S. KNOTS, Springfield, Ohio, assignor to Oliver S. Kelly, same place. Filed Feb. 5, 1898. Serial No. 669,261. (No model.)

Claim.—1. In a conveying apparatus, the combination with a track or way, a conveyor on said track, and propelling means; of an abutment, a carrier adapted to lodge on said conveyor in position to encounter said abutment, a holder for said carrier adapted to support the same in a position different from that it occupies on the conveyor, the latter and the carrier having provisions for engagement when the carrier is thus lodged in the holder, to shift the carrier clear of the abutment as it is transferred to the conveyor.

2. In a conveying apparatus, the combination with a track or way, a conveyor on said track, and propelling means; of a pendent abutment, a carrier adapted to lodge in said conveyor in position to encounter said abutment, a holder for said carrier adapted to support the same in a position lower than that it occupies on the conveyor, the latter and the carrier having provisions for engagement when the carrier is thus lodged in the holder, to move the carrier beyond the abutment as it is transferred to the conveyor.

3. In a conveying apparatus, the combination with a track or way, a conveyor on said track, and propelling means; of an abutment, a carrier adapted to lodge on said conveyor in position to encounter said abutment, a holder for said carrier adapted to support the same in a position different from that it occupies on the conveyor, said holder having an elongated rest for the carrier and suitable stops, and the conveyor and the carrier having provisions for engagement when the carrier is thus lodged in the holder, to shift the carrier clear of the abutment as it is transferred to the conveyor.

4. In a conveying apparatus, the combination with a track or way, a conveyor on said track, and propelling means; of a pendent abutment, a carrier adapted to lodge in said conveyor in position to encounter said abutment, a holder for said carrier adapted to support the same in a lower position than it occupies on the conveyor, said holder having an elongated rest for the carrier and suitable stops, and the conveyor and the carrier having provisions for engagement when the carrier is thus lodged in the holder, to move the carrier on its rest beyond the abutment as it is transferred to the conveyor, substantially as described.

5. In a conveying apparatus, the combination with a track, a conveyor thereon, and propelling means; of one or more pendent abutments, a carrier adapted to lodge on the conveyor in position to encounter said abutments, the carrier having a plurality of projections at opposite sides, and a holder for said carrier having elongated rests or ways for the said projections of the carrier to lodge upon, the holder adapted to support the carrier in a lower position than it occupies in the conveyor and the latter and the carrier having provision for engagement to advance the carrier on the ways of the holder to clear the abutments in transferring the carrier to the conveyor.

6. In a conveying apparatus, the combination with a track, a conveyor thereon, and propelling means; of one or more pendent abutments, a carrier adapted to lodge on the conveyor in position to encounter said abutments, a carrier having a plurality of projections at opposite sides, and an elevator for holding said carrier in position to be taken by the conveyor, but in a lower position than the carrier occupies on the conveyor, the latter and the carrier having provisions for engagement to advance the carrier clear of the abutments in its transfer to the conveyor from the elevator.

7. In a conveying apparatus, the combination of a suitable track or way, a conveyor traveling thereon and having a carrier-rail with a beveled end, a carrier adapted to lodge on said rail, an abutment for said carrier to encounter when on the conveyor, and a holder between which and the latter the carrier is transferred, said holder adapted to support the carrier in a different position than it occupies on the conveyor, the beveled end of the carrier-rail of the latter operating to shift the carrier from such different position, and sufficient friction being engendered between the conveyor and the carrier to cause the latter to be carried beyond the abutment before it is shifted into line with the same.

8. In a conveying apparatus, the combination of a suitable track or way, a conveyor traveling thereon and having a carrier-rail with a beveled upper side at one end, a carrier adapted to lodge on said rail, a pendent abutment for the carrier to encounter when on the conveyor, and a holder between which and the latter the carrier is transferred, said holder adapted to support the carrier in a lower position than it occupies on the conveyor, the beveled upper side of the carrier-rail of the latter operating to lift the carrier from such lower position, and sufficient friction being engendered between the conveyor and the carrier to cause the latter to be carried beyond the abutment before being lifted into line therewith.

9. In a conveying apparatus, the combination of a suitable track or way, a conveyor traveling thereon and having carrier-rails with beveled upper edges at the forward end, a carrier having front and

rear hooks to take over said rails and also one or more stop projections, one or more pendent abutments for the latter to encounter when the carrier is on the conveyer, and a holder having elongated rests upon which the carrier drops when disengaged from the conveyer, said rests having stop projections beyond the pendent abutments and the carrier adapted to be slid forward on said rests and against said stop projections by the engagement of the carrier-rails of the conveyer with the rear hooks of the carrier, the beveled upper sides of the said rails operating to lift the carrier and bring its stop projections into line with the pendent abutments beyond the same, substantially as described.

10. In a conveying apparatus, the combination of a suitable track or way, a conveyer traveling thereon and having carrier-rails with beveled upper edges at the forward end, and outstanding spring-strips on the sides, a carrier having front and rear hooks to take over said rails and also one or more stop projections, one or more pendent abutments for the latter to encounter when the carrier is on the conveyer, and a holder having elongated rests upon which the carrier drops when disengaged from the conveyer, said rests having stop projections beyond the pendent abutments and the carrier adapted to be slid forward on said rests and against said stop projections by the engagement of the spring-strips on the carrier-rails of the conveyer with the rear hooks of the carrier, the beveled upper sides of the said rails operating to lift the carrier and bring its stop projections into line with the pendent abutments beyond the same, substantially as described.

11. In a conveying apparatus of the character described, a conveyer or carriage comprising rails to engage and support the carriers, frames extending between said rails, a forward truck horizontally swiveled to one of said frames, and a trailer-truck horizontally and vertically swiveled to the other of said frames.

12. In a conveying apparatus, the combination with a suitable track or way, a conveyer thereon, and means for propelling the conveyer along the track; of guide-rails at a receiving-station, movable manipulative stop mechanism intermediate the ends of said guide-rails, and a carrier adapted to lodge in and be carried by the conveyer or to lodge on the guide-rails at the receiving-station by coming against an abutment or abutments presented by the said stop mechanism.

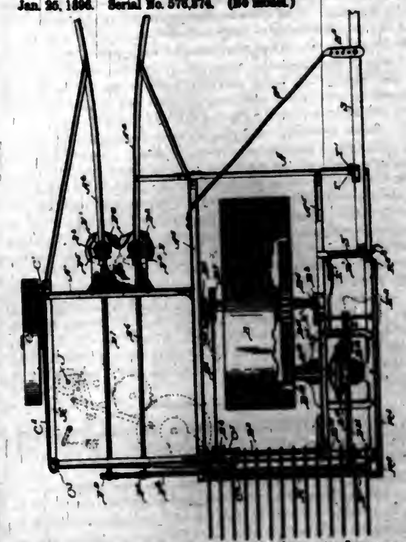
13. In a conveying apparatus, the combination with a suitable track or way, a conveyer thereon, and means for propelling the conveyer along the track; of horizontal guide-rails at a receiving-station, vertically-movable spring-sustained stop-pieces adjacent said rails intermediate the ends thereof, means for depressing said stop-pieces, and a carrier adapted to lodge on and be carried by the conveyer or to lodge on the guide-rails at the receiving-station by coming against an abutment or abutments presented by the said stop mechanism.

14. In a conveying apparatus, the combination with the track, the conveyer traveling thereon, propelling means, and a carrier having means of engagement with the conveyer and also lateral projections; of front and rear rails at a receiving-station adapted to support the carrier by the lateral projections thereon, one of said rails being in a lower plane than the other to facilitate removal of the goods from the carrier, and devices, whereby transfer of the carrier between the conveyer and the station may be automatically effected.

15. A holder or carrier for a conveying apparatus of the character described, said carrier comprising a body portion, rods extending lengthwise thereof and projecting beyond its ends and connected with the body by suspension-rods, hook-shaped projections fixed on said longitudinal rods, and stop projections on one of said latter rods.

16. In a conveying apparatus, the combination of a track, a conveyer thereon, inclined ways extending transversely of the track at a receiving-station, a holder on said ways, and a spring-held catch to engage the said holder when the latter is at the high end of the ways, the conveyer having provision for displacing said catch.

17. The combination of the track, the conveyer thereon, and the receptacle or carrier adapted to lodge on said conveyer, the conveyer and carrier having stop pieces or catches adapted for engagement to prevent separation thereof and one of said catches being movable relative to the other to permit separation of the carrier and conveyer at a predetermined station; abutments being provided on the carrier and at such station one movable with respect to the other and that on the carrier adapted to encounter that at the station; and the movable abutment coacting with the movable catch to displace the same, substantially as and for the purpose described.



18. The combination of the track, the conveyer thereon, and the receptacle or carrier, adapted to lodge on said conveyer, the conveyer and carrier having stop pieces or catches adapted for engagement to prevent separation thereof, and one of said catches being movable relative to the other to permit separation of the carrier from the conveyer at a predetermined station, and an abutment at that station, for the carrier to encounter, provisions existing for displacement of the movable catch by coaction with the carrier.

19. The combination of the track, the conveyer thereon, and the receptacle or carrier adapted to lodge on said conveyer, the conveyer and carrier having stop pieces or catches adapted for engagement to prevent separation thereof and one of said catches being movable relative to the other to permit separation of the carrier and conveyer at a predetermined station; and an abutment at such station in the form of a pivoted arm normally standing in the path of a projection on the carrier and having associated with it a projection adapted to enter the path of the movable catch and effect the displacement thereof when the abutment-arm is displaced, substantially as described.

20. The combination of the track, the conveyer thereon, and the receptacle or carrier adapted to lodge on said conveyer, the conveyer having a trip-lever normally standing behind a projection on the carrier and the latter having an abutment projection; and a lever located at a station where the carrier is deposited, an arm of said lever normally standing in the path of the said abutment projection on the carrier and another arm of said lever having a projection to effect the displacement of the trip-lever, substantially as described.

21. In a conveying apparatus of the character described a fixed abutment-arm for the carrier to encounter, and a spring-strip fastened to the arm and extending in front of the portion thereof encountered by the carrier, said spring-strip adapted to be displaced by the latter and having a shoulder to prevent rebounding of the same after striking the arm.

603,608. CORN-HARVESTER. DAVID F. LEHMAN, Whitewater, Wis., assignor to Adolphus Strassman, same place, Ledyard V. Lewis, Sun Prairie, Wis., and Stephen S. Allen, Rockton, Ill. Filed Jan. 26, 1896. Serial No. 576,574. (No model.)

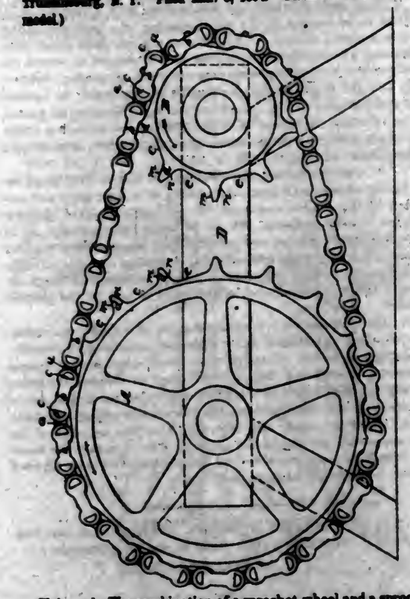
Claim.—1. The combination with a corn-harvester frame mounted to rock upon the axes of two supporting-wheels, of a tongue attached to the frame, means for moving the tongue bodily from side to side while so attached, and means for adjustably fixing, in all positions of the tongue, the angle made by it with the plane of the frame.

2. The combination with a suitable frame, of a binding mechanism supported by said frame and arranged for binding standing stalks, a binding-platform in position to support the stalks during such binding, and platform-supporting devices supporting the platform at heights depending upon variation in the weight that may rest upon it.

3. The combination with suitable binding devices, of a binding-platform arranged below said devices to move vertically, and springs arranged to afford yielding resistance to the depression of the platform.

4. In a corn-harvester, the combination with a binding-platform hinged at its front end to swing vertically, of devices for supporting its free rear end, a pair of endless coacting stalk-conveying chains located above the platform, and sprocket-wheels guiding the rear portions of said chains and supported from the platform to swing therewith.

5. The combination with the binder-frame, of vertically-extensible needle, knotter, packer and compressor shafts mounted therein, means for actuating said shafts, a plurality of needles mounted upon the needle-shaft, corresponding knotters mounted upon the knotter-shaft, suitable arms borne by the packer and compressor shafts, a binder-platform supported by devices permitting it to descend automatically under unusual weight of stalks, and means for equally and synchronously extending all said shafts; whereby a plurality of bands may be applied at automatically-adjusted distances from the butts of the stalks.



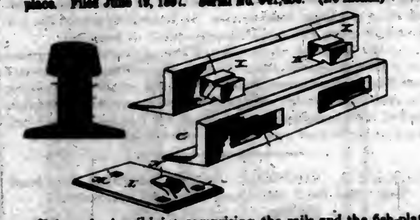
6. In a corn-harvester, the combination with cutting devices, of chains adjustable in height arranged to carry the butts of the stalks rearward, a vertically-adjustable platform arranged to support the stalks so carried, and protecting-walls arranged to rise and fall with said chains and platform, substantially as set forth.

7. The combination with the frame and the vertical knife-shafts, of the inclined gathering members supported from said frame and provided with central bearings for the upper ends of the knife-shafts, the gathering-chains lying within said members, the inclined shafts mounted upon said members, and gearing connecting the ends of the inclined shafts with the chain-driving shafts at their upper ends and with the knife-shafts at their lower ends, respectively.

8. In a corn-harvester, the combination with a rigid frame bearing all the guiding and primary driving mechanism, of a secondary frame detachably fixed to the first and bearing all the cutting and binding mechanism, and a drive-chain forming the sole operating connection between the two mechanisms, for the purpose set forth.

9. In a corn-harvester, the combination with two suitably-mounted parallel knife-shafts, of the knife fixed to one of said shafts and having the distinct cutting edges, a similar knife mounted upon the other shaft in position to overlap and coact with the first, and means for adjustably fixing the latter knife to the stationary support for its shaft.

603,609. SPROCKET-AND-CHAIN GEAR. EVERETT F. MORSE, Tremansburg, N. Y. Filed Mar. 3, 1894. Serial No. 502,172. (No model.)



Claim.—1. The combination of a sprocket-wheel and a sprocket-chain composed of open and solid links, the solid links entering between the teeth and the wheel having seats for the alternate links to rest upon, arranged around its periphery, said seats being inclined at an angle to a circle passing through them and described about the center of the wheel, as described.

2. The combination of a sprocket-wheel and a sprocket-chain composed of open and solid links, the solid links entering between the teeth, and the wheel having seats between its teeth for the alternate links of said chain, said seats being inclined to a circle passing through them and concentric with the wheel, the ends of said seats adjacent to the working faces of the teeth being more remote from the center of the wheel than the opposite ends, substantially as described.

3. The combination of a sprocket-wheel and a sprocket-chain composed of open or side and solid or center links, the solid links entering between the teeth, and the wheel being cut or formed between each two teeth with a peripheral supporting-surface for the end of the solid link adjacent to the working face of the tooth, and a peripheral cut-away or relatively lower portion under the other or idle end of the solid link whereby the said idle end will lie in a straight line joining the working faces of the said two teeth, and out of frictional contact with the periphery of the sprocket, as set forth.

4. The combination of a sprocket-wheel and a sprocket-chain composed of open or side and solid or center links, the solid links entering between the teeth, and the wheel being formed or provided with raised bearing-surfaces adjacent to the working faces of the teeth, which support the working ends of the solid links and maintain their opposite or idle ends out of contact with the periphery of the wheel and prevent rubbing friction between the sprocket and the chain, as set forth.

603,610. RAIL-JOINT AND TIE-PLATE. JOHN A. MCCAIN, Decatur, Ga., assignor of one-half to Washington J. Houston, same place. Filed June 19, 1897. Serial No. 641,459. (No model.)

Claim.—1. A rail-joint comprising the rails and the fish-plates, one of said fish-plates being provided with the longitudinal slots having one end larger than the other, and the smaller end dovetailed, the opposite plate being provided on its inner face with studs or projections formed integral therewith having the dovetailed ends to be inserted through the larger portions and locked in the smaller dovetailed portions of the slots of the opposite plate, substantially as shown and described.

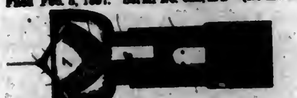
2. A rail-joint comprising the rails and the fish-plates, one of said plates being provided with the longitudinal slots having one end larger than the other which is dovetailed, the opposite plate being provided on its inner face with studs or projections formed integral therewith and having the dovetailed ends to be inserted and locked in the smaller or dovetailed portions of the slots of the opposite plate, in combination with the tie-plate having the openings, and a lip formed integral with the upper face thereof, said lip being curved on its under side so as to embrace the flange of the rail, as and for the purpose set forth.

603,611. EAVES-TROUGH. BENJAMIN F. ITE, Quincy, Mich. Filed June 30, 1896. Serial No. 597,349. (No model.)

Claim.—An eaves-trough, having its inner wall carried upward above said trough, thence outward over said trough, and backward to the line of attachment of the roof, all in gentle curves, substantially as described.

603,612. DRYING APPARATUS. BENJAMIN B. SNYDER and JESSE J. SELLNER, Baltimore, Md., assignors to the Nitrogen Processing Company, New York, N. Y. Filed Sept. 25, 1897. Serial No. 653,089. (No model.)

Claim.—1. In a drier, the combination with the elongated casing, of a trough in the lower part of the casing, a shaft having paddles operating in the trough, a vertical longitudinal partition in the



upper part of the casing having its lower edge adjacent to the paddles, means for forcing air down upon one side of said partition and an outlet for the moistened gases from the compartment on the opposite side of the partition, substantially as described.

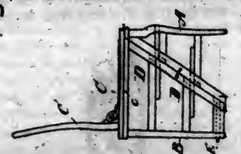
2. In a drying apparatus, the combination of a casing having a trough, the conveyer-shaft adapted to move materials along said trough, a central longitudinal partition above said conveyer shaft, a furnace, means for producing a forced draft for said furnace and directing the hot gases down upon one side of said partition, and an outlet to the chamber on the other side of the partition whereby said hot gases may be circulated with the material through the trough, substantially as described.

3. In a drier, the combination with the elongated casing, of a trough in the lower part of the casing, the conveyer-shaft having paddles operating in the trough, a vertical partition dividing the casing into two compartments above the conveyer, steam-coils in one of said compartments, means for blowing air or gases over said steam-pipes, and a vent for the moistened gases in the other compartment, said air or gas being directed from the steam-coils around the conveyer-shaft along with material, substantially as described.

4. In a drier, the combination of one section thereof provided with a conveyer, steam coils, a furnace, and means for blowing heated gases through the furnace over the coils and around the conveyer, of a second drier-section provided with a conveyer, with steam-coils supplied with superheated steam from the first section, and with means for blowing air over said coils, substantially as described.

608,613. GAS-BURNER. CLARENCE S. STEWARD, Chattanooga, Tenn. Filed Feb. 5, 1897. Serial No. 622,494. (No model.)

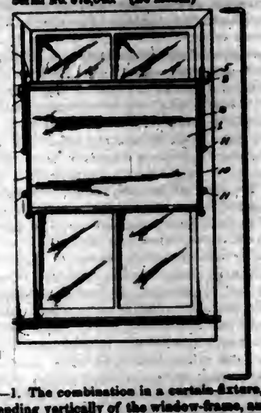
Claim.—1. A gas-burner comprising an outer shell, a bowl within the shell, a gas-cavity between the walls of the shell and the bowl, closed at the top by the meeting of such walls, and oppositely-discharging orifices extending from the cavity through the wall of the bowl, and defined by isolated tips projecting from the wall of the bowl, substantially as set forth.



2. A gas-burner comprising an outer shell, a bowl within the shell, a gas-cavity between the walls of the shell and of the bowl closed at the top by the meeting of the said walls, and isolated, adjustable burner-tips projecting toward each other from the wall of the bowl, the orifices through the tips communicating with the gas-cavity, substantially as set forth.

3. A gas-burner comprising an outer shell, a bowl within the shell, a gas-cavity between the walls of the shell and of the bowl, closed at the top by the meeting of such walls, and oppositely-discharging gas-orifices from the said gas-cavity, extending through the wall of the bowl and discharging above the bottom of its concavity, whereby there is a free open space below the flame, and any carbon which may be deposited from the flame will collect in the bowl, substantially as set forth.

4. A gas-burner composed entirely of steatite, comprising an outer shell, a bowl contained therein, a gas-cavity between the shell and the bowl, closed at its upper end by the meeting of the walls of the bowl and the shell, and means for egress of the gas through the wall of the bowl, substantially as set forth.

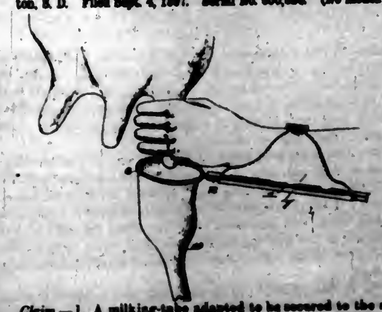


5. A gas-burner composed entirely of steatite, comprising an outer shell, a bowl within the shell, a gas-cavity between the shell and the bowl, closed at its upper end by the meeting of the walls of the bowl and the shell, and oppositely-discharging orifices for the gas, defined by isolated tips projecting from the wall of the bowl, substantially as set forth.

608,614. COMBINATION CHAIR, WASHBENCH, &c. JOSEPH VAN MELSE, Cleveland, Ohio. Filed Oct. 22, 1896. Serial No. 609,760. (No model.)

Claim.—A convertible chair consisting of two hinged base portions A, B, provided with suitable vertical and inclined legs between the latter of which is secured a series of steps D, in combination with a seat portion C hinged to the top of the portion A, as and for the purpose set forth.

608,615. CURTAIN-FIXTURE. WILLIAM J. WALTERS and WILLIAM W. ROSSER, Guthrie, Okla. Filed Oct. 24, 1896. Renewed Mar. 24, 1898. Serial No. 675,040. (No model.)



Claim.—1. The combination in a curtain-fixture, of a guide rod or wire extending vertically of the window-frame, and an adjustable bracket slidingly mounted thereon and provided with reversely-disposed flaps or rests located in close proximity to the window-casing and adapted to bear against the same for preventing the canting of the bracket to either side, substantially as described.

2. In a curtain-fixture, the combination with a vertical guide adapted to be secured to the window-casing, of a vertically-sliding bracket mounted thereon and formed from a single sheet-metal blank comprising a forwardly-projecting ear portion adapted to receive the curtain-roller journal, reversely-disposed rests projecting substantially at right angles to the ear portion and adapted to operate against the window-casing, spaced eye-bearings embracing the guides, and an adjusting-rod connected to said bracket and extending within convenient reach of a person standing at the window, substantially as described.

3. In a curtain-fixture, the combination with a vertical guide-rod having its terminals bent substantially at a right angle and embedded in the window-casing, of an adjustable bracket slidingly mounted on said guide-rod, and an adjusting-rod connected at its upper end to said bracket and provided with lateral crimps forming stops, the free end of the said adjusting-rod being movable laterally to engage or disengage either of said lateral crimps with the lower inturned end of the guide-rod, substantially as and for the purpose specified.

4. The combination in a curtain-fixture, of a guide-rod extending vertically of the window-frame, a bracket comprising a forwardly-projecting ear portion to receive the curtain-roller journal, spaced eye-bearings embracing the guide-rod, ears or recesses extending laterally at a right angle to the roller supporting ear in the rear of the guide-rod and adapted to engage the window-casing, an adjusting-rod having its upper end bent to fit over the top edge of the roller-supporting ear and having also a shoulder to engage the lower edge of said ear, and means to hold the adjusting-rod in its adjusted position, substantially as described.

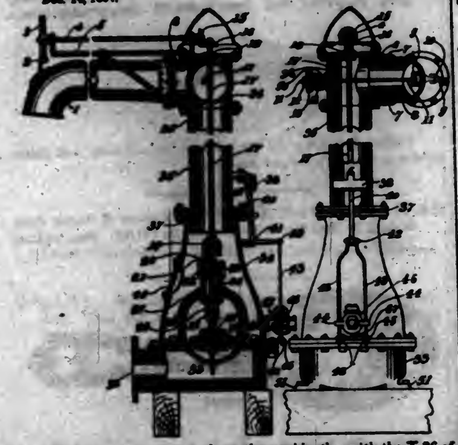
608,616. MILKING APPARATUS. OLE R. HARMEN, Lake Preston, S. D. Filed Sept. 4, 1897. Serial No. 650,698. (No model.)

Claim.—1. A milking-tube adapted to be secured to the arm of the operator, and provided with means whereby the position thereof may be adjusted.

2. A milking-tube provided with means whereby it may be attached to the wrist or forearm of the operator, and means whereby it may be adjusted longitudinally and laterally.

3. In a device of the character set forth, the combination of a frame, means for securing said frame to the arm of the operator, a ring attached to said frame, a milking-tube supported by said ring, and means for adjusting the relative positions of said ring and frame, substantially as and for the purpose described.

4. In a device of the character set forth, a hollow casing adapted to be attached to the arm of the operator, a longitudinally and laterally movable rod in said casing, a ring attached to one end of said rod, and a milking-tube supported by said ring.



5. In a device of the character set forth, a hollow casing, means for attaching said casing to the arm of the operator, a jointed rod longitudinally movable in said casing, a ring attached to one of the sections of said rod, and a milking-tube supported by said ring, as and for the purpose described.

6. In a device of the character set forth, a hollow casing, a strap for attaching said casing to the arm of the operator, a longitudinally-movable jointed rod in said casing, one of the sections of said rod having grooves in its outer edges, a ring having laterally-extending arms thereon fitting within said grooves, a band for securing said arms to said rod, and a milking-tube supported by said ring, substantially as and for the purpose described.

7. In a device of the character set forth, a casing having an opening extending longitudinally therethrough which is smaller at one end than at the other, a strap for securing said casing to the arm of the operator, a jointed rod, one section of which fits tightly the contracted portion of said opening, and the other section having longitudinal grooves in the opposite edges thereof, a ring having laterally-extending arms thereon fitting within said grooves, a band for securing said arms to said rod, and a milking-tube supported by said ring, substantially as and for the purpose described.

REISSUES.

11,662. WATER-COLUMN. BENJAMIN D. GALE, Weatherby, Mo. Filed Jan. 20, 1898. Serial No. 667,893. Original No. 595,957, dated Dec. 14, 1897.

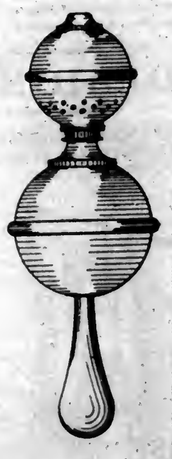
Claim.—1. In a water-column the combination with the T 36 of the discharge-spout 1 arranged to have its delivery end raised and lowered and its elbow 8 to rotate in joint 6 said joint being provided with packing 7 and held in place and elastically tightened by swivel 9, spring 50 and intermediate parts, substantially as set forth and described.

2. The combination in a water-column of a discharge-spout 1 with inside elbow 8 rotating in swing-joint 6 with packing 7, swivel 9 engaging rod 11, spring 50 for the purpose of automatically taking up the wear on joint 6 and packing 7, together with wheel 3 and hook 2 for disengaging the delivery end of spout 1, bracket 5 and shaft 4 carrying miter-gear 15 engaging miter-gear 16 and driving vertical shaft 17 passing through stuffing-box 18 and having square socket-wrench 19 rotating nut 20, driving valve-stem 21 held in place by shoulder 22 rotating in bonnet-nut 23, the threaded end of valve-stem 21 engaging perforation 25 in the square valve-nut 26, square perforation 27, yoke 28, seat 31 and valve 30, ball-joint 29, valve-chamber 34 and the upright main pipe 35 and T 36, substantially as described and for the purpose specified.

3. In a water-column a horizontal discharge-spout with delivery end that may be raised or lowered at will in combination with T 36, main pipe 35 and valve-chamber 34, and check 47 with connecting mechanism for automatically controlling the drainage, substantially as described and for the purpose specified.

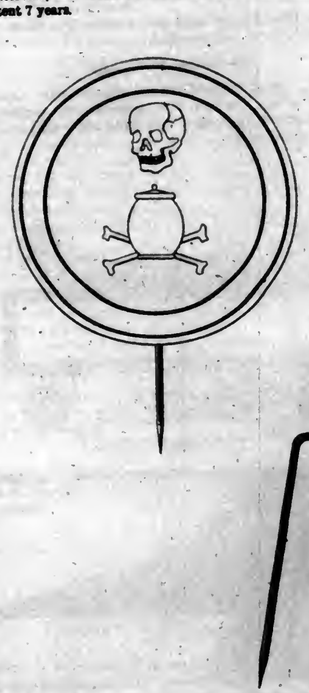
DESIGNS.

28,520. COVER FOR MEMORANDUM-BOOKS. CHARLY W. HUPSCHMIDT, Prairie du Chien, Wis. Filed Feb. 24, 1898. Serial No. 671,537. Term of patent 7 years.



Claim.—The design for a cover for memorandum-books, substantially as herein shown and described.

28,521. PRINT OR PATTERN FOR CIGAR-BOXES. CHARLES ARTHUR SPRAKMAN, New York, N. Y., assignor to the American Lithographic Company, same place. Filed Mar. 2, 1898. Serial No. 672,334. Term of patent 7 years.



Claim.—The design for an ornamental print or pattern for cigar-boxes substantially as shown and described.

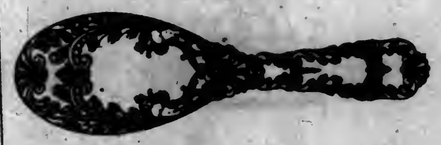
28,522. BODY FOR CIGAR-LIGHTERS. EDWARD SCHAEFER, St. Louis, Mo., assignor to the Missouri Lamp and Manufacturing Company, same place. Filed Jan. 15, 1898. Serial No. 666,823. Term of patent 3½ years.

Claim.—The design for a body for a cigar-lighter as herein shown and described.

28,523. BADGE OR SIMILAR ARTICLE. FREDERICK J. COBBER, Waterville, Me. Filed Feb. 4, 1898. Serial No. 669,152. Term of patent 7 years.

Claim.—The design for a badge or similar article, substantially as shown and described.

28,524. HANDLE FOR SPOONS, FORKS, &c. HENRY L. WALLACE, Wallingford, Conn., assignor to the R. Wallace & Sons Manufacturing Company, same place. Filed Feb. 8, 1898. Serial No. 669,501. Term of patent 7 years.



Claim.—A design for a handle for spoons, forks and similar articles as herein shown and described.

28,525. HANDLE FOR SPOONS, FORKS, &c. JOHN CARLIN, Wallingford, Conn., assignor to the Simpson Hall Miller & Company, same place. Filed Feb. 8, 1898. Serial No. 669,502. Term of patent 7 years.

Claim.—The design for the handle of spoons, forks, and similar articles as herein shown and described.

28,526. BACK FOR BRUSHES, &c. THEODORE W. FOSTER, Providence, R. I. Filed Mar. 31, 1898. Serial No. 676,008. Term of patent 7 years.

Claim.—The design for the back of a brush or similar article herein shown and described.

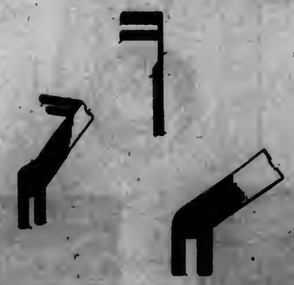
28,527. COVER FOR PUFF-BOXES. THEODORE W. FOSTER, Providence, R. I. Filed Mar. 31, 1898. Serial No. 676,009. Term of patent 7 years.

Claim.—The design for the cover of a puff-box or similar article herein shown and described.

28,528. HANDLE FOR MANICURE OR SIMILAR ARTICLES. THEODORE W. FOSTER, Providence, R. I. Filed Mar. 31, 1898. Serial No. 676,004. Term of patent 7 years.

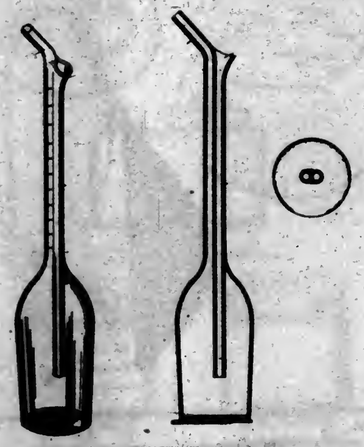
Claim.—The design for the handle of manicure and similar articles herein shown and described.

28,529. HANDLES FOR SCISSORS. THEODORE W. FOSTER, Providence, R. I. Filed Mar. 31, 1898. Serial No. 676,005. Term of patent 7 years.



Claim.—The design for the handles of scissors or similar articles herein shown and described.

28,530. KNIFE. WILLIAM G. MEYER, Boston, Mass. Filed Mar. 14, 1898. Serial No. 673,572. Term of patent 14 years.

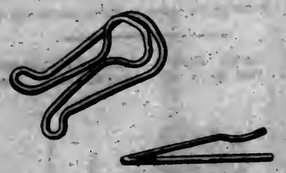


Claim.—The design for a knife as herein shown and described.

28,531. BOX-LID HOLDER. JOSEPH LAMBAR CONWAY, Sioux City, Iowa. Filed Mar. 22, 1898. Serial No. 674,267. Term of patent 14 years.

Claim.—The design for a box-lid holder herein shown and described.

28,532. BOTTLE. CONSTANTINE WAGNER, New York, N. Y. Filed Jan. 20, 1898. Serial No. 668,264. Term of patent 7 years.

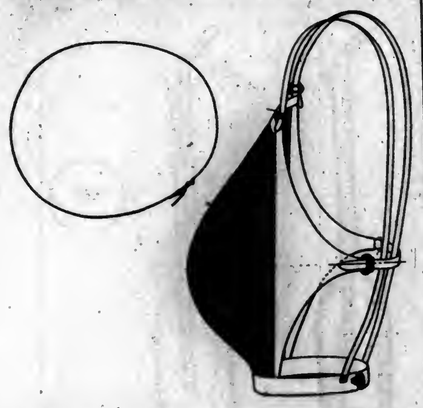


Claim.—The design for a bottle, as herein shown and described.

28,533. SPRING FOR GLOVE-FASTENERS. EDWIN J. SCOVILLE, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Feb. 12, 1898. Serial No. 670,189. Term of patent 14 years.

Claim.—The design for a spring for a glove or clothing fastener, substantially as shown and described.

28,534. FASTENING-EYE. JAMES THOMSON, Glenside, Pa. Filed Mar. 19, 1898. Serial No. 673,697. Term of patent 7 years.



Claim.—The design for a fastening-eye, as herein shown and described.

28,535. HOOK FOR GARMENT-FASTENERS. ALBERT BOERTER, New York, N. Y. Filed Mar. 22, 1898. Serial No. 674,353. Term of patent 14 years.

Claim.—The design for the hook of a garment-fastener, as shown and described.

28,536. WAIST-FRONT DISTENDER. ROSE SAHLIS, Chicago, Ill. Filed Oct. 28, 1897. Serial No. 656,712. Term of patent 3½ years.

Claim.—The design for a waist-front distender herein shown and described.

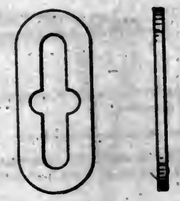
28,537. SHOE-PLATE. MANSFIELD M. WISE, Cleveland, Ohio. Filed Oct. 6, 1897. Serial No. 654,304. Term of patent 14 years.

Claim.—The design for a shoe-plate herein shown and described.

28,538. SEAL. HARRY S. SHILA, North Baltimore, Ohio. Filed Feb. 28, 1898. Serial No. 671,302. Term of patent 7 years.

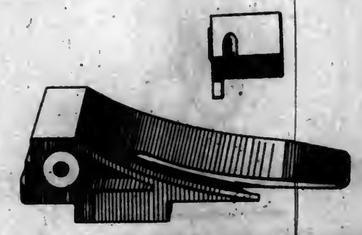
Claim.—The design for a seal, as herein shown and described.

28,539. CLAMP. HENRY L. AMBLER and WILLIAM AMBLER, Cleveland, Ohio. Filed Mar. 5, 1897. Serial No. 626,140. Term of patent 7 years.



Claim.—The design for a clamp, as herein shown and described.

28,540. DOOR-LATCH. RUDOLPH H. MARTENS, Colfax, Wash. Filed Feb. 2, 1898. Serial No. 668,803. Term of patent 14 years.

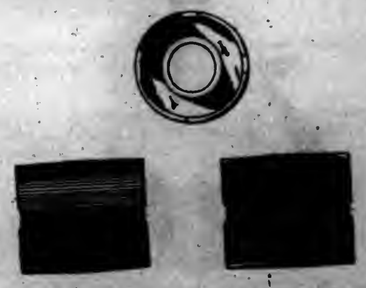


Claim.—The design for a door-latch, as herein shown and described.

28,541. SHACKLE-BOLT LINK. BENJAMIN C. BROWN, Groton, Iowa. Filed Oct. 27, 1897. Serial No. 656,008. Term of patent 7 years.

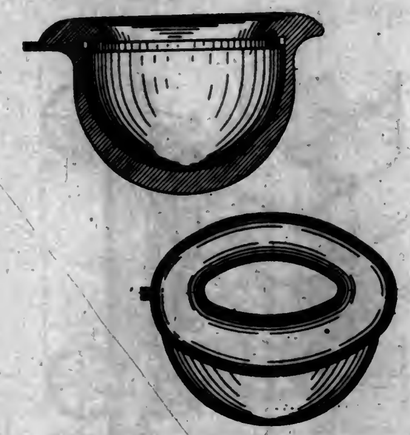
Claim.—The design for a shackle-bolt link, substantially as shown.

28,542. BRAKE-SHOE. OLIVER BOOKLEY WHITNEY, Marlborough, N. Y. Filed Jan. 12, 1898. Serial No. 666,466. Term of patent 3½ years.



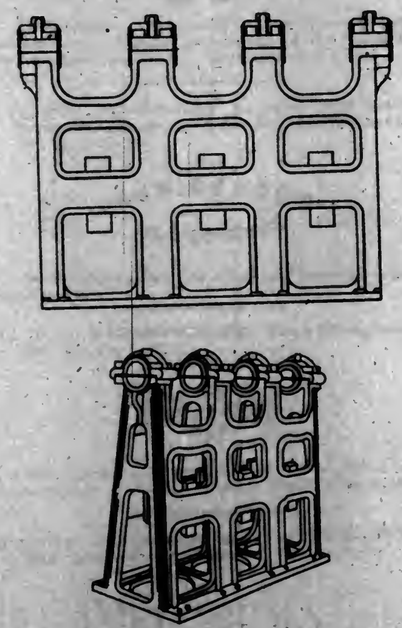
Claim.—The design for a brake-shoe, as herein shown and described.

28,543. TOOTH FOR CYLINDERS AND CONCAVES OF THRESHING-MACHINES. WILLIAM SEVERS, Richmond, Ind., assignor to the Gaar, Scott & Company, same place. Filed Jan. 31, 1898. Serial No. 668,679. Term of patent 14 years.



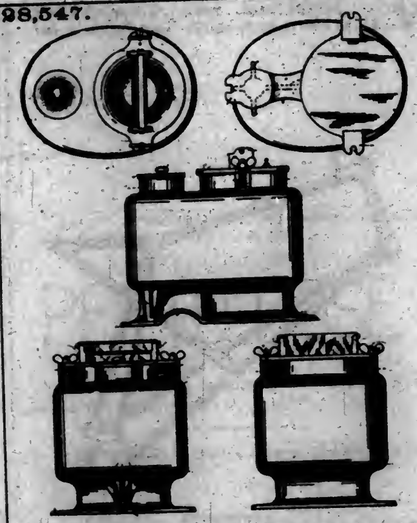
Claim.—The design for a tooth for the cylinders and concaves of threshing-machines, substantially as shown.

28,544. HOSE-MENDING DEVICE. MARK A. LEVERING, Atlantic City, N. J., assignor of one-half to Wm. F. Dill and Howard R. Miller, Philadelphia, Pa. Filed Mar. 17, 1898. Serial No. 674,208. Term of patent 14 years.



Claim.—The design for a hose-mending device, as herein shown and described.

28,545. WATER-CLOSET BOWL. FRANCIS J. MCCORMICK, Jr., and FRANCIS J. MCCORMICK, Dayton, Ohio. Filed Dec. 1, 1897. Serial No. 660,444. Term of patent 14 years.



Claim.—The design for a water-closet bowl substantially as herein shown and described.

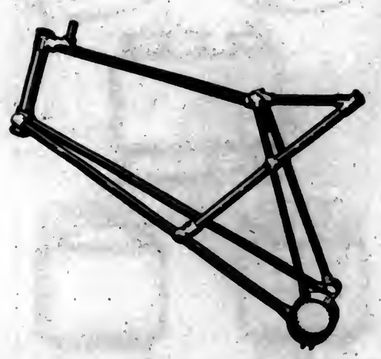
28,546. PUMP-HOUSING. HOSE W. KERR, Dayton, Ohio, assignor to The Stillwell-Bierce & Smith-Vaile Company, same place. Filed Feb. 7, 1898. Serial No. 669,455. Term of patent 14 years.

Claim.—The design for a pump-housing, as herein shown and described.

28,547. CEMENT-RECEPTACLE. JOHN R. HARAWAY, Brockton, Mass., assignor to the Gem Flexible Insole Company, Boston, Mass. Filed Jan. 4, 1898. Serial No. 666,893. Term of patent 14 years.

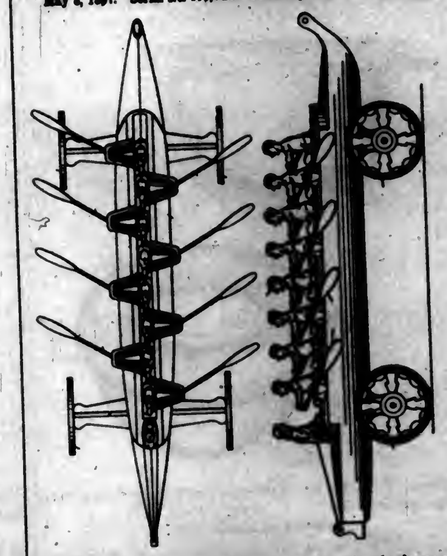
Claim.—The design for a cement-receptacle, substantially as shown and described.

28,548. BEARING-BRACKET FOR BICYCLES. GEORGE JOHN STEVENS, London, England. Filed Dec. 20, 1897. Serial No. 662,753. Term of patent 3½ years.



Claim.—The design for a bearing-bracket for bicycles, substantially as shown and described.

28,549. BICYCLE-CRANK. DANIEL G. STOVER, Freeport, Ill., assignor to the Stover Bicycle Manufacturing Company, same place. Filed Feb. 19, 1898. Serial No. 670,973. Term of patent 7 years.



Claim.—The design for a bicycle-crank herein both shown and described.

28,550. BICYCLE-FRAME. GEORGE I. K. MORROW, Detroit, Mich. Filed Nov. 22, 1897. Serial No. 659,522. Term of patent 14 years.

Claim.—The design for a bicycle-frame, substantially as herein shown and described.

28,551. TOY. GRANVILLE W. WEBBER, New Haven, Conn., assignor to the United States Hardware Company, same place. Filed May 4, 1897. Serial No. 636,749. Term of patent 3½ years.

Claim.—The design for a toy substantially as herein shown and described.

TRADE-MARKS

REGISTERED MAY 3, 1898.

31,497. CIGARS. ALLEN & HANBURY, Philadelphia, Pa. Filed Mar. 3, 1898.

Essential feature.—The words "YUKON GIRL" and the representation of an Alaskan Indian girl. Used since January 31, 1898.

31,498. WINES. BARTON & GUESTIER, Bordeaux, France. Filed Feb. 19, 1898.

Essential feature.—The representation of two shields, one emblazoned with a spread-eagle and crescents and the other emblazoned with boars' heads and a rosette. Used since January 1, 1875.

31,499. FRICTION-MATCHES. THE DIAMOND MATCH COMPANY, Chicago, Ill.; Wilmington, Del.; Detroit, Mich., and Westville, Conn. Filed Mar. 4, 1898.

DRAWING ROOM MATCHES.

Essential feature.—The words "DRAWING ROOM MATCHES." Used since 1870.

31,500. POLISHING PREPARATION. KATE G. RADEMAN, Jackson, Mich. Filed Feb. 9, 1898.

Essential feature.—The words "DELIGHT OF THE HOME" and the representation of a female in medallion. Used since July 15, 1897.

31,501. SOAPS, COSMETICS, SALVES, AND LOTIONS FOR THE SKIN. LAIRD & CRITCH, New York, N. Y. Filed Feb. 17, 1898.

VELCREMA

Essential feature.—The word "VELCREMA." Used since January 1, 1898.

31,502. PROPRIETARY ARTICLES. CENERAL CHEMICAL COMPANY, New York, N. Y. Filed Feb. 18, 1898.

PEPTO-ROSE

Essential feature.—The compound word "PEPTO-ROSE." Used since February 1, 1896.

31,503. LINIMENT. JOHN TARRANT SUSSE, New York, N. Y. Filed Feb. 3, 1898.

TOWNSEND'S
OLD
LINIMENT.

Essential feature.—A facsimile of the signature of "V. P. D. TOWNSEND" and the initials "V. P. D." in parentheses, the same being used in connection with the words "TOWNSEND'S LINIMENT." Used since 1875.

31,504. COMPOUND OF MALT AND COD-LIVER OIL. ALLEN & HANBURYS, LIMITED, London, England. Filed Feb. 15, 1898.

BYNOL

Essential feature.—The word "BYNOL." Used since December, 1898.

31,505. MEDICINAL PREPARATIONS AND MEDICATED FOODS. ALLEN & HANBURYS, LIMITED, London, England. Filed Feb. 15, 1898.

Essential feature.—The representation of a plow. Used since 1884.

31,506. MEDICINAL PREPARATIONS AND MEDICATED FOODS. ALLEN & HANBURYS, LIMITED, London, England. Filed Feb. 15, 1898.

ALLENBURYS

Essential feature.—The word "ALLENBURYS." Used since November, 1895.

81,507. CERTAIN FOODS AND RELISHES. CHARLES RICHARD VALENTINE, Lee, England. Filed Aug. 14, 1897.

Essential feature.—The representation of two hands and forearms, one above the other, the lower hand holding a cup and saucer and the upper hand in the act of dropping a globule or tablet into the cup. Used since February, 1897.

81,508. CERTAIN FOODS AND RELISHES. CHARLES RICHARD VALENTINE, Lee, England. Filed Aug. 14, 1897.

Essential feature.—The pictorial representation of a side bust view of a woman holding in one hand a box of tablets or globules, the other hand being in the act of raising a tablet or globule to her mouth. Used since February, 1897.

81,509. ORGANS. FREDERICK G. SMITH, New York and Saratoga Springs, N. Y.; Washington, D. C.; Jersey City, Newark, and Paterson, N. J.; Chicago, Ill., and St. Louis and Kansas City, Mo. Filed Mar. 7, 1898.

BRADBURY.

Essential feature.—The word "BRADBURY." Used since February, 1874.

81,510. PIANOFORTES. FREDERICK G. SMITH, New York and Saratoga Springs, N. Y.; Washington, D. C.; Jersey City, Newark, and Paterson, N. J.; Chicago, Ill., and St. Louis and Kansas City, Mo. Filed Mar. 7, 1898.

Bradbury

Essential feature.—The word "BRADBURY." Used since 1860.

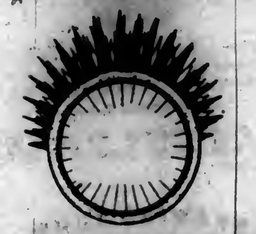
81,511. TUBULAR CHEESE-CLOTH BANDAGES. WEST BOYLSTON MANUFACTURING COMPANY, West Boylston, Mass. Filed Dec. 27, 1897.

GIANT

Essential feature.—The word "GIANT." Used since July 1, 1896.

81,512. CABLES, ROPES, CORDS, AND TWINES. O. F. SEIZ COMPANY, Philadelphia, Pa. Filed Mar. 4, 1898.

ROPOLEUM



Essential feature.—The word "ROPOLEUM." Used since December 4, 1896.

81,513. SAWS AND SAW-TOOLS. REMEDY COMBINATION SAW-TOOL COMPANY, New York, N. Y. Filed Feb. 8, 1898.

Essential feature.—The simulation of a deer's head. Used since January 15, 1896.

81,514. BICYCLES AND SIMILAR VEHICLES. MARY ELIZABETH JOHNSON, Fitchburg, Mass. Filed Nov. 9, 1897.

Essential feature.—The representation of an annular band having flame-like projections extending from the upper half of its periphery. Used since January 1, 1897.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

HAMMOND v. HART.

Decided April 25, 1898.

1. INTERFERENCE—CONSTRUCTION OF RULE 96.

Rule 96 means that when the formal requirements of an application—such, for example, as the requirement for a new drawing or for an amended oath or for further action upon rejected claims which are not involved in the interference or for analogous changes—have not been complied with the interference shall be declared, so that the party whose application is in proper form shall not be unnecessarily delayed in the further prosecution of his application.

2. SAME—RULES 96, 94, 95, AND 98.

Rule 96 does not mean that the Examiner declaring the interference can ignore the requirement that the *claims* of the party in fault must be put in such condition that they will not require alteration. If Rule 96 means that, then Rule 95 means nothing. The two rules should be construed in connection with Rules 96 and 94, so as to give vitality to all.

3. SAME—INTERFERENCE BETWEEN ALLOWED AND REJECTED CLAIMS.

Under a proper interpretation of the rules there is no justification for the declaration of an interference between the *allowed claims* of one application and the *rejected claims* of another application. Two applications do not interfere in such a case.

4. SAME—GENERIC AND SPECIFIC CLAIMS.

A generic and a specific claim do not interfere, and it does not conflict with public interest to send a generic claim to issue after a specific claim has been patented. (*Drawbaugh* v. *Blake*, 68 O. G., 1681; *Reed* v. *Landman*, 85 O. G., 1275, cited.)

5. SAME—SCOPE OF CLAIMS—EX PARTE UPTON.

So far as the case of *ex parte Upton* (87 O. G., 99) holds that an interference should be declared between two applications or between an application and a prior patent whose claims are not substantially identical in tenor and scope it is not well founded in law, and this decision is overruled.

6. SAME—INTERFERENCE IN FACT—APPLICATIONS—APPLICATION AND PATENT.

There is no different rule of law applicable to an interference when it is declared between two applications than when it is declared between an application and an unexpired patent. The same principles which determine whether there would be an actual interference must apply alike in each of the conditions in which the cases are when before the Patent Office to determine whether they would interfere. (*Kingon* v. *Carter*, 66 O. G., 813, overruled.)

7. SAME—SAME.

An interference can only be instituted for the purpose of determining the question of priority of invention between two or more parties claiming substantially the same patentable invention; that of necessity there must be allowed claims to all parties before an interference can be declared, and that not only a patent and an application must claim in whole or in part the same invention, but also two applications must claim in whole or in part the same invention before an interference can be declared.

8. SAME—EXAMINER SUGGESTING CLAIMS TO APPLICANTS.

Where two applications are concurrently pending having claims of different scope drawn on the same structure, there is no good reason why the Examiner should not give the applicant making the specific or narrow claim an opportunity, by suggestion, if necessary, to make the broader claim. If the suggestion is followed, then the parties would be making a claim identical in tenor and scope, and an interference will properly and naturally follow. To this extent *ex parte Weeden* (60 O. G., 1191) overruled.

APPEAL on motion.

ENGINE.

Application of Isaac B. Hammond filed January 23, 1897, No. 620,424. Application of Henry C. Hart filed June 11, 1896, No. 595,192.

Messrs. Barton & Brown for Hammond.

Mr. Ellis Spear and *Mr. Elliott J. Stoddard* for Hart.

DUELL, *Commissioner:*

This is an appeal from the decision of the Primary Examiner denying Hart's motion for dissolution of the interference. The following are the points of appeal: first, no interference in fact; second, no interfering claims; third, non-patentability of the claims of Hammond involved in the interference, and, fourth, irregularity in the declaration, preventing proper determination of the question of priority.

The third point will not in this case be considered by me in determining whether or not an interference exists.

The first and second points can ordinarily be considered as one, and, broadly stated, can be summed up in the one question, do the claims of the parties interfere?

The fourth point will in this case be first separately considered.

A review of the proceedings in the two cases involved in this interference shows that Hart filed his application for patent and that his claims were rejected by the Primary Examiner and appealed to the Examiners-in-Chief, where the action of the Examiner was affirmed, but with certain recommendations, under which Hart's application was amended, new claims being inserted, which were allowed by the Examiner. At this point Hammond was directed by the Examiner to place his application in condition for a probable interference. Thereafter his application was amended, which resulted in an allowance of two claims and the rejection of nine claims. At this point the Primary Examiner declared the interference under two counts, which will hereinafter be considered. Certain of Hart's claims were declared to be involved

88 O G 5-4

in the interference. Neither of the claims allowed to Hammond was placed in the interference, which was declared as embracing Hammond's rejected claims.

It appears that Hammond after the declaration of the interference moved, under Rule 109, for leave to file an amendment consisting of two claims, which are the issues of the interference. The motion was transmitted to the Primary Examiner, but so far as I can discover the motion was not passed upon by him. As the interference was not redeclared, as required by the rule, I take it that the amendment was not admitted.

In order to determine the propriety of this action and whether or not the interference was irregularly declared, reference must be had to the rules of this Office relating to interferences. Rule 93 states:

An interference is a proceeding instituted for the purpose of determining the question of priority of invention between two or more parties claiming substantially the same patentable invention.

Rule 94 states that interferences will be declared in certain cases, the following being the only one applicable in this case:

Between two or more original applications containing conflicting claims.

The interference having been declared by the Examiner between the two applications, one of which (Hammond's) contained no allowed or even allowable claims conflicting with the allowed claims of Hart, if the action of the Examiner be correct, the declaration of the interference was clearly irregular unless justification for the same can be found in other rules of the Office relating to interference proceedings. Such justification cannot be found under Rule 95, because that rule expressly states that before the declaration of an interference all preliminary questions must be settled by the Primary Examiner and the issue must be clearly defined, the invention which is to form the subject of the controversy must be decided to be patentable, and the *claims* of the respective parties must be put in such condition that they will not require alteration after the interference shall have been finally decided unless the testimony adduced upon the trial shall necessitate or justify such change. No allowed claim made by Hammond has been embraced in this interference, and therefore the requirements of Rule 95 have not been complied with. Nor is it believed that justification can be found under Rule 96, which reads as follows:

96. When, however, a party who is required to put his application in a condition proper for an interference fails to do so within a reasonable time specified, the declaration of interference will not be delayed. After final judgment of priority the application of such party will be held for revision and restriction, subject to interferences with other applications.

Upon the face these two rules seem to conflict; but when Rule 96 is properly construed there is no conflict between the two, and Rule 96 does not overrule the requirements of Rule 95. As I understand Rule 96 and as I believe it should be interpreted it simply means that when the formal requirements of an application—such, for example, as the requirement for a new drawing or for an amended oath or for further action upon rejected claims which are not involved in the interference or for analogous changes—have not been complied with the interference shall be declared, so that the party whose application is in proper form shall not be unnecessarily delayed in the further prosecution of his application. The rule does not mean that the Examiner declaring the interference can ignore the requirement that the *claims* of the party in fault must be put in such condition that they will not require alteration, etc. If Rule 96 means that, then Rule 95 means nothing. The two rules should be construed in connection with Rules 93 and 94, so as to give vitality to all.

Under the above interpretation there is no conflict between the rules, and I think that in declaring interferences this interpretation of the rules should be followed. I can see no justification for the declaration of an interference between the *allowed claims* of one application and the *rejected claims* of another application. Two applications do not interfere in such a case.

Applying to the facts in this case the natural and obvious construction to be placed upon the rules, I find that there was an irregularity in the declaration of the interference which prevents a proper determination of the question of priority, for the reason that Hammond's application contains no *allowed* claims said to be embraced within the issues, and therefore he is not claiming in whole or in part the same invention as is Hart.

Ordinarily I should not consider the other points of appeal; but this seems to be an opportune time to pass upon some other points here raised and which are constantly arising in interference proceedings. There seems to be a lack of uniformity in the Office relative to the question whether applications or applications and patents interfere, in view of which a review of the rulings of the courts and conflicting Patent Office decisions may not be amiss at this time.

That mere *infringing* claims are not *interfering* claims is evident throughout the whole list of decisions of the courts.

The courts have uniformly decided that under the statutes applicable to interferences two patents do not interfere within the meaning thereof when they do not *claim* in whole or in part the same invention. The decisions of this Office unfortunately have not been uniform in deciding the question whether or not two applications interfere within the meaning of the statutes and rules of the Office applicable to this subject.

In the case of *Gold and Silver Ore Separating Co.* v. *U. S. Disintegrating Ore Co.* (3 Fish., 489) the court held that—

two patents interfere within the meaning of section 16 only when they claim, in whole or in part, the same invention.

The section referred to was section 16 of the act of July 4, 1836, which corresponds to section 4918 of the present Revised Statutes.

In *Nathan Co.* v. *Craig*, (58 O. G., 1093,) which was a suit brought under section 4918 of the Revised Statutes, Judge Colt in deciding the case said:

Upon suits brought under this section it has, therefore, been

repeatedly held, until it has become well-settled law, that two patents interfere within the meaning of this section only when they claim in whole or in part the same invention.

Many cases are cited to sustain this finding.

In *Stonemetz Printer's Machinery Co.* v. *Brown Folding Machine Co.*, (64 O. G., 1135,) a suit brought under the same section, Judge Acheson in deciding the case said:

* * * Patents interfere only when they claim the same invention in whole or in part. * * * And in a proceeding under section 4918 the court cannot go beyond the claims and consider generally the two patents as a whole. It has been held that an interference does not exist within the meaning of the statute between a patent having a dominant broad claim and a junior patent having a subordinate specific claim. * * * Here the claim of Brown's patent, No. 321,762, is not coextensive with any of the claims of the Stonemetz patent; but it is a very specific subservient claim.

In *Dederick* v. *Fox*, (63 O. G., 1963,) which was a suit brought for alleged infringement of certain Letters Patent, but wherein the pleadings raised the question of interference of patents under section 4918, Judge Buffington in considering the case said:

Interference and infringement are essentially distinct. The question of interference is determined by the claims, not by the general appearance and functions of the machine shown but not claimed. The elements of Wickey's first claim are, first, an encircling hoop, and, secondly, devices for tightening the hoop, neither of which appears in any of Dederick's claims.

The second claim is still more limited, for it includes, besides the two named, a number of others, and what is said of the first applies the more to it. The fifth claim is for a specific form of construction. It is not for the same invention Dederick made, but is subordinate thereto.

An examination of this case shows that there were two species. Dederick claimed the genus and his species and Wickey claimed his species. Although Dederick's genus dominated Wickey's species, the court held that there was no interference of claims.

Reference might be made to many other cases; but the rulings of the courts that unless claims are of the same tenor and scope they do not interfere and that dominating and dominated claims cannot interfere have been so uniform that it seems useless to multiply authorities. So far as the courts are concerned it appears that the only question which they consider in determining whether an interference in fact exists between claims is whether the *claims* interfere and that in considering this question it is unnecessary to determine the question of patentable novelty or the question whether the claims are patentably different.

In proceeding to discuss the decisions of the Patent Office relating to this matter I have no doubt that if the principles adopted by the courts are put into practice in the Office there will be fewer interferences declared, and when declared there will not be as many motions made to dissolve for lack of interference in fact.

In considering the decisions of the Commissioners of Patents upon the question when is there an interference in fact I have only given heed to such decisions as have been made since 1879. On January 1, 1880, revised rules of practice took effect. In these rules appeared a new rule defining an interference proceeding in the Patent Office. That rule has remained unchanged to this day. It then read and still reads in part as follows:

An interference is a proceeding instituted for the purpose of determining the question of priority of invention between two or more parties claiming substantially the same patentable invention.

The decisions to which I shall make reference have all been made under that rule.

The first reported case which I find decided under the new rule is that of *Drawbaugh* v. *Blake*, (23 O. G., 1221.) In substance this case holds that the question is whether the claims of the parties cover substantially the same invention; that formal and non-essential differences should be disregarded; that a broad or generic claim and a limited or specific claim do not interfere, and that it does not conflict with public interest to send a broad or generic claim to issue after a narrow or specific claim has been patented. To my mind this case is well reasoned and is founded on the statute (section 4904) and the rules of practice applicable thereto.

Just a year later the decision was practically reversed by *ex parte Upton*, (27 O. G., 99,) which holds, among other things, that if the claim of one party will include that of the other there is an interference in fact. This finding is unsupported by any cited authority and is clearly opposed to the decisions heretofore cited and to those cited in *Drawbaugh* v. *Blake*.

The case also finds that it should be settled in the Patent Office who is entitled to the broad claim, and this should appear as the result of an interference proceeding. I do not think that it is the province of the Patent Office to settle who is entitled to any claim, broad or narrow, unless an applicant first makes the claim. It is the well-settled rule of practice in *ex parte* proceedings that where an applicant fails to make a claim as broad as he is entitled to his application is sent to patent. It appears in the Upton case that the patentee, Dodge, had but one very limited claim to the construction shown and described, while the applicant, Upton, made broad claims to the genus. The rules in force when the Upton case was decided contained one similar to present Rule 75, and it seems to me that the patent to Dodge, being a proper reference to the broad claim of the Upton application, under the rules, Upton, if he claimed to have made the invention before the date of the application for the Dodge patent and having made the necessary affidavit overcoming the patent as a reference, should have had his application passed to issue and should not have been placed in interference with the Dodge patent. Such I believe to be the proper practice, and it should be followed.

The Upton case further holds that—

neither the spirit of the law nor public policy sanctions the granting of patents with specific claims while applications with generic claims which include the specific claim allowed are still pending, the objection being that whether the application with the generic claim pending belongs to the same party who has a specific claim under the genus, or is an application of a different party, a patent covering by a generic claim, if a subsequent patent, improperly extends the monopoly.

It is evident that the gist of the Upton decision is that to fail to put into interference claims which have the relation of broad and narrow or generic and specific is error. The first reason for the ruling, as above stated, is that such course is contrary to "the spirit of the law." The answer to this is

that the spirit of the law can be determined only by its language and by the decisions of the courts construing this language. The second reason is that "public policy" does not sanction such a course. It is not stated what public policy is violated, unless it is meant that thereby a monopoly is extended. If it means that, it is not well founded. It is unsafe to conclude that what the law requires is contrary to public policy. To obey the law is certainly not contrary to public policy. To promote the useful arts subserves public policy. They are promoted by the disclosure of an invention through the speedy issue of the patent. The third reason adduced in support of the conclusion is that the action "improperly extends the monopoly." I do not think this reason is well founded. It cannot be presumed that a patentee who has gone out with a narrow claim made the broad invention. The presumption is that he claimed all that he invented. Another applicant, having made a broad claim, is entitled to his patent. If a patent with a narrow claim has meanwhile issued, the applicant with the broad claim, having given sufficient proof that he made the broad invention before the application for the patent for the narrow invention was filed, is entitled to his patent. The two patents being issued the long line of reported cases proves conclusively that the courts would undoubtedly hold that the two patents were not interfering patents. If the patentee holding the first patent containing the narrow claim proved that he was the first inventor of the subject-matter of the broad claim contained in the second patent, such claim of the second patent would, in proper proceedings in the courts, be held to be void and invalid. Again, a monopoly is extended only when two patents claim the same thing in the same breadth. In order to extend the monopoly, two coexistent patents must each have the same claims. The two patents must be coextensive in the number of the elements and in the breadth of each element. The reasons stated for requiring an interference between two applications differing in the breadth of the claims are of no force, for the reason that whether the two coexisting patents are obtained as the result of or without an interference proceeding there is no extension of any monopoly. I do not think that the question whether an extension of a monopoly will result from the institution of or failure to institute an interference proceeding in the Patent Office can properly be considered. It is not the province of the Patent Office to make law. The law as it stands should be obeyed, and such wrongs as result from the law should be corrected by legislation, not by forced judicial construction. So far as the Upton case holds that an interference should be declared between two applications or between an application and a prior patent whose claims are not substantially identical in tenor and scope it is not well founded in law.

The decision in the Upton case seems to have been in the main followed until the decision in the case of *Reed* v. *Landman*, (55 O. G., 1275.) This case overruled *ex parte Upton* in its holding that when one claim included another there is an interference. It practically revived and affirmed the decision in *Drawbaugh* v. *Blake*, *supra*. In one respect, however, it made an exception to the decision in the earlier case in that it held that an interference should be declared between a generic or broad claim and a specific or narrow claim when both claims are drawn on the same structure. The Commissioner said:

> Of course generic and specific claims, based upon the same structure of invention, conflict, because the invention is one and the same, whether generically or specifically stated.

The reason for the exception made by the Commissioner is not given. On principle it does not seem to me to be well founded. Neither claim would sustain a separate patent. The existence of both patents does not extend the monopoly of either claim. One patentee may reissue to make an interference with the patent of the other. Even if one has lost the right of reissue there is but one monopoly running. It cannot run more than seventeen years. It may be terminated by the result of a suit in court. It is not essential to the decision of this case to assert that this exception is clearly erroneous, and the necessity for its application to any given case hereafter can easily be avoided. Where two applications are concurrently pending having claims of different scope drawn on the same structure, I see no good reason why the Examiner should not give the applicant making the specific or narrow claim an opportunity, by suggestion, if necessary, to make the broader claim. If the suggestion is followed, then the parties would be making a claim identical in tenor and scope, and an interference will properly and naturally follow.

In giving approval to such practice I have considered the case of *ex parte Weeden*, (60 O. G., 1191,) and to this extent that case may be considered as overruled.

The case of *Reed* v. *Landman* also holds that the rule which determines the existence of an interference in the courts applies in the Patent Office, and in support of that finding reference is made to the case of *Gold and Silver Ore Separating Co.* v. *U. S. Disintegrating Ore Co.*, *supra*, and attention is called to the fact that section 8 of the act of 1836 corresponds to section 4904 of the Revised Statutes relating to interference proceedings in the Patent Office.

The rule laid down in *Reed* v. *Landman* was followed in *Edison* v. *Stanley, Jr.*, (57 O. G., 273;) *Zettinger* v. *Reynolds*, (57 O. G., 1279;) *Searle* v. *Frumveller*, (58 O. G., 804;) *Dodd* v. *Reading*, (58 O. G., 1413,) and in other cases with scarcely an exception until in *Kinyon* v. *Carter* (66 O. G., 513) it was held that the rule of *Reed* v. *Landman* did not apply where both parties were *applicants*, and it was asserted that an interference properly exists where different specific forms are shown by the two applicants, both capable of being covered by a broad claim, although but one of the applicants makes the broad claim, while the other makes a claim limited to his species. No authority is cited in *Kinyon* v. *Carter* to sustain the holding that

there is a different rule to be applied in an interference between two applications than in an interference between an application and a patent. In both cases an interference does not and cannot legally exist unless the claims are coextensive. The courts have clearly held that the interference proceeding intended and carried on under former section 16 of the act of 1836, now section 4918 of the Revised Statutes, is the same as the proceeding contemplated in section 8 of the same act, now section 4904 of the Revised Statutes. (*Gold and Silver Ore Separating Co.* v. *U. S. Disintegrating Ore Co.*, *supra*.) The difference between the two simply rests in the fact that the forum is different. The Examiner or Commissioner treating the question of interference should put himself in the place of a judge of the United States circuit court. He should in deciding whether or not an interference should be declared treat the applications or the patent and the application the same as though they were both issued patents pending before the court. I fail to see any good ground for the conclusion arrived at in *Kinyon* v. *Carter* that there is any different rule of law applicable to an interference when it is declared between two applications than when it is declared between an application and an unexpired patent. The same principles which determine whether there would be an actual interference must apply alike in each of the conditions in which the cases are when before the Patent Office to determine whether they would interfere.

Reviewing the uniform decisions of the courts and the conflicting decisions of the Patent Office, giving due weight to the reasons adduced for arriving at the various conclusions, and noting the authorities sustaining the various conclusions, whenever authorities have been cited, I am of the opinion that an interference can only be instituted for the purpose of determining the question of priority of invention between two or more parties *claiming* substantially the same patentable invention; that of necessity there must be allowed claims to all parties before an interference can be declared, and that not only a patent and an application must claim in whole or in part the same invention, but also two applications must claim in whole or in part the same invention before an interference can be declared.

The subject-matter involved in the interference is stated by the Examiner to be as follows:

> 1. The combination with a wheeled vehicle of an explosive-engine mounted thereon, and operatively connected with a wheel of the vehicle, an apparatus independent of the explosive-engine, arranged to be worked by the exertions of the operator, for forcing the explosive mixture at will into the explosion-chamber of the engine, and means actuated by a part of such forcing apparatus for exploding the charge, whereby, at the will of the operator, the intervals between the explosions of the charges can be controlled.
>
> 2. The combination with a wheeled vehicle of an engine operatively connected with a wheel of the vehicle, a controllable apparatus worked by the exertions of the operator for introducing at will varying quantities of explosive mixture into the engine and compressing the mixture therein, a power-spring mechanism connected with a working part of the engine and adapted to receive and store the energy of the engine and subsequently apply the same to the propulsion of the vehicle, and means actuated by a part of said controllable apparatus for exploding the charge, whereby, at the will of the operator, the quantity of the charge and time of explosion can be controlled.

The first count is stated to be substantially claim 5 and to embrace claims 1, 2, and 6 of the Hart application, and the second count is stated to be substantially claim 4 and to embrace claim 3 of the same application.

Claims 4 and 5 of the Hart application read as follows:

> 4. The combination with a wheeled vehicle, of an engine operatively connected with a wheel of the vehicle, a controllable apparatus worked by the exertions of an attendant for introducing at will varying quantities of explosive mixture into the engine and compressing the mixture therein, a power-spring mechanism connecting a working part of the engine with the body of the vehicle, and means actuated by a part of said controllable apparatus for exploding the charge, whereby, at the will of the attendant, the quantity of the charge and time of explosion can be controlled, substantially as described.
>
> 5. The combination with a wheeled vehicle, of an explosive-engine mounted thereon, and operatively connected with a wheel of the vehicle, an apparatus independent of the explosion-engine, arranged to be worked by the exertions of the operator, for forcing the explosive mixture at will into the explosion-chamber, and means actuated by a part of such forcing apparatus, for exploding the charge, whereby, at the will of the operator, the intervals between the explosions of the charges can be controlled.

Claims 1, 2, 3, and 6 are all narrower than claims 4 and 5.

No claim allowed to Hammond is placed in interference. His rejected claims are not similar to Hart's allowed claims. Some of Hammond's rejected claims are far broader than Hart's and not patentable in the opinion of the Examiner.

Comparing Hart's claims with the issues it will be seen that the issues are not his claims. The Examiner has constructed the issues out of Hart's claims 4 and 5. In other words, the Examiner has made two new issues, neither of which is an allowed claim made by either party. I believe this to be bad practice. The applicants should make the issues by their claims. If an Examiner for any reason desires the issues to be different, he should arrive at that result by requiring the claims to be amended by the applicants.

The applications contain no interfering claims, and for that reason also the interference should be dissolved.

Furthermore, the weight of authority and reason clearly warrant a finding that no interference in fact exists, because the parties do not claim, in whole or in part, the same invention.

The decision of the Primary Examiner is reversed.

EX PARTE BRAND.

Decided December 13, 1897.

1. DESIGN—DIVISION.

The requirement of the Examiner that applicant restrict the application to one or the other design for castings for a bedstead rail-joint affirmed.

2. SAME—SAME—ARTICLES USED TOGETHER—UNITARY DESIGN—AGGREGATION.

The fact that two articles are used together does not make them, when so used, constitute a unitary design, but the result is merely an aggregation of the two designs. (*Ex parte Pullis*, 35 O. G., 980; *ex parte Haggard*, 60 O. G., 1126.)

3. SAME—SAME—SAME.

The fact that the parts are specially designed for detachment it cannot be held that the two together constitute a unitary design merely because they may be used together.

4. SAME—SAME—DETACHABLE PARTS.

A design must be a single unchangeable article of manufacture and must not be made up of independent detachable parts.

ON petition.

DESIGN FOR A RAIL-JOINT FOR IRON BEDSTEADS.

Application of George Brand filed October 22, 1896, No. 609,767.

Messrs. Townsend & Decker for the applicant.

GREELEY, *Assistant Commissioner:*

This is a petition from the action of the Primary Examiner requiring the applicant to restrict his application to the design for one or the other of his castings for a bedstead rail-joint.

The application discloses a casting on the side rail of a bedstead and another adapted to be attached to the frame of the bedstead, which castings are adapted to interlock and form a joint.

The claim is as follows:

The design for the parts of a joint for bedstead-rails, substantially as shown and described.

It is apparent from the above statement that the application is not limited to a single article of manufacture, as provided in section 4929 of the Revised Statutes, but covers two separate and distinct articles, which bear no resemblance to each other in shape or configuration and are in no way connected except in being used together. The fact that two articles are used together does not make them, when so used, constitute a unitary design, but the result is merely an aggregation of the two designs. (*Ex parte Patitz*, 25 O. G., 980; *ex parte Haggard*, 80 O. G., 1126.) A design must be a single unchangeable article of manufacture and must not be made up of independent detachable parts. As stated in *ex parte Brower*, (C. D., 1873, 151:)

It is arbitrary and unchangeable, either by the separation or the rearrangement of its features.

In the present case the parts are not only detachable, but the shape or configuration of the parts is designed for the very purpose of attachment and detachment from each other, and it seems to have no other purpose. In view of the fact that the parts are specially designed for detachment it cannot be held that the two together constitute a unitary design merely because they may be used together.

The Examiner's requirement was proper, and therefore this petition is denied.

EX PARTE ELDON.

Decided April 11, 1898.

1. DESIGN—MISLEADING STATEMENT IN SPECIFICATION AS TO MODIFICATIONS.

The specification contained this paragraph: "While the drawings illustrate the cylindrical body of the grip as being provided with circular rows of the perforations or holes and continuous circular ribs or beads alternating with the rows of perforations or holes, it will be understood that this specific arrangement may be modified to some extent without departing from the spirit or principle of the present invention, the essential feature of which is a cylindrical body provided with annular rows of perforations, and exterior circumferential ribs arranged between the rows of such exterior perforations." On appeal from the requirement of the Examiner that this statement be canceled *Held* that this statement was evidently intended to make the application cover some other form or modification of design than that shown in the drawing; that it either has this effect or is unnecessary and misleading and should be canceled.

2. SAME—SAME—EFFECT OF BROADENING CLAIM.

Held, further, that such statement does not and cannot have the effect of broadening the claim so as to cover other modifications not shown, as it purports to do, and it is therefore misleading and should be canceled.

3. SAME—SAME—TESTING MODIFICATIONS BY INFRINGEMENT.

Held, further, that, while under the test laid down by the Supreme Court in the case of *Gorham Co. v. White* (14 Wall., 511) as to modifications, the modifications which applicant had in mind in introducing such statement may be held infringements, yet neither the applicant nor the Office can settle this question in advance, and therefore the statement purporting to do so is misleading and should be canceled.

4. SAME—SAME—MODIFICATIONS NOT SHOWN.

If a party cannot cover two modifications by disclosing them, he should not be permitted to do so by a bare statement that his application is intended to cover them, although they are not shown.

ON petition.

DESIGN FOR A HANDLE-BAR GRIP FOR BICYCLES.

Application of Charles E. Eldon filed August 27, 1897, No. 649,784.

Messrs. C. A. Snow & Co. for the applicant.

GREELEY, *Assistant Commissioner:*

This is a petition from the action of the Primary Examiner requiring the applicant to cancel the following paragraph contained in the specification:

While the drawings illustrate the cylindrical body of the grip as being provided with circular rows of the perforations or holes and continuous circular ribs or beads alternating with the rows of perforations or holes, it will be understood that this specific arrangement may be modified to some extent without departing from the spirit or principle of the present invention, the essential feature of which is a cylindrical body provided with annular rows of perforations, and exterior circumferential ribs arranged between the rows of such perforations.

This statement was evidently intended to make the application cover some other form or modification of the article than that shown in the drawings. It either has that effect or is unnecessary and misleading. The practice of the Office on the question as to the right of a party to disclose more than one modification of his design was announced in the recent case of *ex parte Coe*, (81 O. G., 2086,) wherein it was said:

When an inventor has produced a design, he has produced a single shape or configuration and not a duality or plurality of such shapes or configurations. He may make additions, but he cannot make modifications without destroying the identity of the design as such.

In the later case of *ex parte Hill and Renner*, (82 O. G., 1988,) also, it was said:

There is abundant authority for the holding that modifications of designs do not exist and should not be shown and described in one patent.

If a party cannot cover two modifications by disclosing them, he certainly should not be permitted to do so by a bare statement that his application is intended to cover them, although they are not shown.

It is held, however, that the statement referred to does not and cannot have the effect of broadening the claim so as to cover other modifications, as it purports to do, and that it is therefore misleading.

It is well settled that the question of infringement of designs is determined by the similarity of appearance in the eye of the ordinary observer. If the resemblance is such as to deceive such an observer, giving ordinary attention to the matter, so that he mistakes one for the other, there is infringement. This is the test recognized by the Supreme Court, (*Gorham Co. v. White*, 2 O. G., 592; 14 Wall., 511,) and the applicant cannot change it in any way by the ideas which he may express as to what would be an infringement. The eye of the ordinary purchaser and not the opinion of the inventor governs in such case. Under this test the modifications which the applicant had in mind in introducing this statement may be held infringements; but neither the applicant nor the Office can settle this question in advance, and therefore the statement purporting to do so is misleading.

This rule does not apply to mechanical patents, since the test of infringement of such patents is not the same as of a design patent.

The petition is denied.

Patented Drawings—Date of Filing to be Printed Thereon.

(ORDER No. 1,901.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 6, 1898.

It is hereby ordered that on and after July 1, 1898, the date of the filing of the application be printed in the heading to the drawings of the printed copies of patents in addition to the matter now appearing thereon.

C. H. DUELL,
Commissioner.

Notice to Show Cause.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 7, 1898.

The following notice to show cause is published in the OFFICIAL GAZETTE for the reason that it has been found impracticable to serve notice in the usual way, a registered letter containing notice to the same effect, mailed to Mr. Holgate at his last-known address, having been returned with the report that it could not be delivered.

To George H. Holgate, doing business under the name of the Association American Inventors, last known address Betz Building, Philadelphia, Pennsylvania, present address unknown:

SIR: Copies of charges filed against you as representative of the Association American Inventors by the following-named persons were sent you on the dates mentioned below, and you were given until February 12, 1898, to answer the same, if you desired to do so:

I. N. Fickes, of Holland, Kans.....January 21, 1898.
Nathan Lloyd, of Greenbrier, Mo.....January 22, 1898.
J. L. Zeiger, of Cleveland, Ohio.....January 22, 1898.
John McWilliams, of Egypt Mills, Mo..February 5, 1898.

You were informed in the letters accompanying the charges of McWilliams, Lloyd, and Fickes that, inasmuch as you were not registered as a patent attorney, disbarment proceedings would not be instituted. It has been determined, however, that inasmuch as you still represent a number of applicants before this Office in applications filed before the 1st of January, 1898, as is shown by a list of such cases filed by your representative on January 14, 1898, and in which registration was waived, said list numbering 171 cases, you are practicing before the Office and within the provisions of the statute you are subject to disbarment proceedings. In view of this fact and in view of the fact that in some of the foregoing cases the filing of the answer was made optional with you you are hereby required to show cause on or before the 15th day of June, 1898, in each of these cases, why you should not be disbarred from practice and why the Commissioner of Patents should not refuse to recognise you as patent agent in accordance with the statutes in such cases made and provided.

C. H. DUELL,
Commissioner.

Correspondence.

1. Communications to the Patent Office must be addressed to the Commissioner of Patents.

2. A double correspondence with the inventor and an assignee, or with a principal and his attorney, or with two attorneys cannot generally be allowed.

3. The assignee of the entire interest of an invention is entitled to hold the correspondence with the Office.

4. Actions by the Office which are wanting in official propriety will be canceled from the files. Communications to the Office in violation of the requirements of decorum and courtesy will not be accepted or will be returned.

5. Separate letters must be written about assignments for record, final fees for patents, orders for copies, abstracts of title, complaints against officials, and every other distinct subject of communication.

CERTIFICATES OF REGISTRATION ISSUED MAY 10, 1898.

PATENTS

GRANTED MAY 10, 1898.

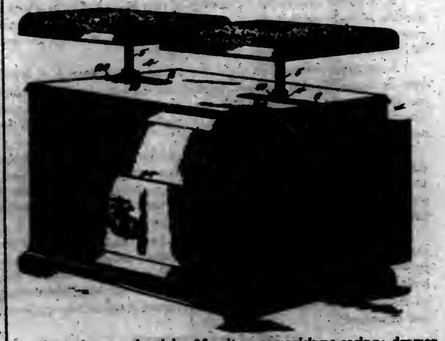
603,617. PIANO-STOOL. HENRY B. RAMM, Bristol, Pa. Filed May 20, 1897. Serial No. 638,503. (No model.)

Claim.—1. The combination of a spiral ratchet-rod, a pawl adapted to engage therewith, laterally-movable means of supporting and guiding the ratchet-rod and supporting the pawl, a seat supported by said ratchet-rod and laterally movable thereon and means adapted normally to restrain and to be manually operated to permit the said lateral movement of the seat upon the ratchet-rod.

2. The combination of a spiral ratchet-rod, a pawl adapted to engage therewith, means of manually operating the pawl to disengage it from the ratchet-rod, the pawl adapted normally to restrain the downward rectilinear movement and to permit the upward rectilinear movement of the rod and to permit the upward-and-downward rotating movement of said rod.

3. The combination with a supporting-base of a spiral ratchet-rod, a pawl adapted to engage therewith, means, laterally movable with respect to the supporting-base, of supporting and guiding the ratchet-rod and supporting the pawl, a rotatably-mounted shaft adapted to actuate the pawl by its rotation but to permit the lateral movement of the pawl upon it, substantially as described.

4. The combination with a support of independently vertically adjustable seat portions movable laterally thereon and an automatic self-releasing bolt for preventing the independent rotation of the seat portions when the same are together but adapted to release the same when they are moved apart either vertically or laterally, substantially as described.



5. The combination with a support, of independently vertically adjustable seat portions, movable laterally thereon, and an automatic self-releasing bolt for preventing the independent rotation of the seat portions, but adapted to release same when they are moved vertically or laterally, substantially as described.

6. The combination of the casing, drawer-compartments formed therein and forming a way therebetween, a flanged socket movable in said way, with the flanges thereof engaging, and moving upon the upper walls of the drawer-compartments, an elevating-rod adjustable vertically in said socket and a seat portion carried by said elevating-rod, substantially as described.

7. The combination with a support, of a socket movable therein, an elevating-rod movable in said socket and provided with a ratchet, a shaft rotatably mounted upon the support, a pawl carried by the socket, and adapted to engage the ratchet, said pawl being slidable upon the shaft but locked from rotation thereon, whereby when the said shaft is operated, the pawl is disengaged from the ratchet, and a seat portion carried by the elevating-rod, substantially as described.

603,618. CABINET AND DUMB-STOOL. HENRY B. RAMM, Bristol, Pa. Filed May 5, 1897. Serial No. 634,897. (No model.)

Claim.—1. An improved article of furniture comprising a casing; drawer-compartments formed therein, said compartments forming between them a way which extends longitudinally of the casing, a sleeve movable in said way, a board secured to the casing above the top of the drawer-compartments and slotted in a line with the way, the walls of the slot of said board provided with flanges, flanges upon the sleeve adapted to move between the flanges of the slotted board and the tops of the drawer-compartments, a stop formed on said board for limiting the movement of the sleeve in one direction, an elevating-rod within the sleeve, a seat portion upon the elevating-rod, and means for retaining the elevating-rod at the proper elevation, substantially as described.

2. An improved article of furniture comprising a casing; drawer-compartments formed therein, said compartments forming between them a way which extends longitudinally of the casing, a sleeve movable in said way, a board secured to the casing above the top of the drawer-compartments and slotted in a line with the way, the walls of the slot of said board provided with flanges, flanges upon the sleeve adapted to move between the flanges of the slotted board and the tops of the drawer-compartments, a step formed on said board for limiting the movement of the sleeve in one direction, an elevating-rod within the sleeve, a seat portion upon the elevating-rod, and means for retaining the elevating-rod at the proper elevation, substantially as described.

3. An article of the class described comprising a base, sleeves movable longitudinally in the same, elevating-rods movable in the sleeves, blocks carried by the upper ends of the elevating-rods, flanges upon the said blocks, seat portions provided with flanged strips upon their under sides which engage the flanges of the blocks whereby the same may be moved thereon, and bolts adapted to project through suitable supports upon the bottom of the seat portions and engage the slots in the blocks whereby the seat portions may be adjusted and secured in their adjustment upon the blocks, substantially as described.

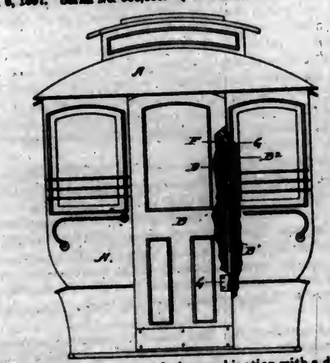
4. An article of the class described, comprising a base, sleeves movable therein, elevating-rods movable in the sleeves, a means for retaining the elevating-rods at the desired elevation, blocks secured to the upper ends of the elevating-rods, flanges formed on the blocks extending transversely the base, flanged strips upon the upper side of the seat portions which are adapted to engage the blocks whereby the same may be moved upon the blocks and bolts carried by the seat portions and adapted to engage the blocks for securing the seat portions in proper adjustment upon the blocks whereby the seat portions may be adjusted transversely the base and by revolving the same can be adjusted longitudinally the base, substantially as described.

5. In an article of furniture the combination of a casing with compartments therein, a way extending longitudinally the casing, a socket movable in said way, means of supporting and guiding said socket, an elevating-rod supported by said socket, a seat portion supported by said rod and having an independent horizontal movement

thereon, locking means of normally restraining said horizontal movement until manually operated and adjustable means of supporting the rod at any desired elevation in said socket, substantially as described.

608,619. PAPER DECORATION. RUDOLF BURGER, Port Richmond, N. Y. Filed Sept. 9, 1897. Serial No. 651,011. (No model.)

Claim.—1. A paper decoration consisting of an upper base and a lower base with layers of fine tissue-paper between them, pasted on each other, once in the center, and once at the edge, or near the edge, or at edge positions, and a string or wire passing through them, fastened with one end to the lower base and having a ring at the other end substantially as shown and described.



2. A paper decoration consisting of two bases between which a number of tissue-papers are pasted together consecutively once in the center and once at the corners and a string passing through the center, substantially as shown and described.

3. A paper decoration consisting of an upper base A, a lower base B, tissue-papers C pasted together alternately, once in the center and once at the edge or at edge positions, a design F stamped throughout the layers and a string D, substantially as shown and described.

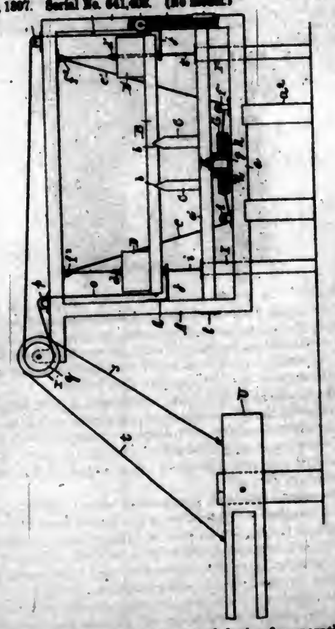
4. In a decoration the combination of the two bases A and B, the tissue-papers C pasted on one another, once in the center, and once at the edge, or near the edge, or at edge positions, and the string D and one "cut-out design" stamped through the layers alone or through the article as a whole, substantially as shown and described.

5. The arrangement of tissue layers between two bases the tissue layers pasted together once in the center, and once at the edge, or near the edge, or at edge positions, and artistically stamped out, a string passing through the layers, fastened at one base, and ending on the other end with a ring or its equivalent, substantially as shown and described.

608,620. DOOR-GUARD. JOHN B. BURTON, Boston, Mass. Filed Dec. 6, 1897. Serial No. 660,839. (No model.)

Claim.—1. In a door-guard, the combination with a door and its frame, of yielding means on the front edge of said door for preventing injury to the hand upon the closing of said door.

2. In a door-guard, the combination with a door and its frame, of yielding means on the front edge of said door for preventing injury to the hand upon the closing of the door, and a groove in the door-frame adapted to receive said means upon the closing of the door.



3. In a door-guard, the combination with a door and its frame, of a rubber tube, a groove on the front edge of said door in which said tube is located, and means for holding said tube in position in said groove.

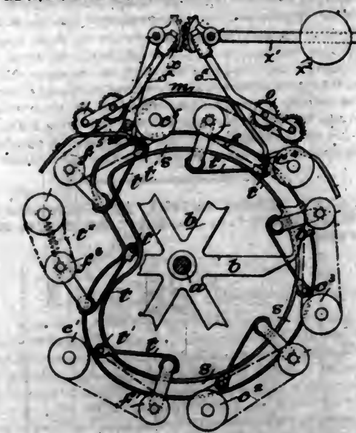
4. In a door-guard, the combination with a door and its frame, of a rubber tube, a groove on the front edge of said door in which said tube is located, means for holding said tube in position in said groove, and a groove in the frame for receiving said tube upon the closing of said door.

5. In a door-guard, the combination with a door and its frame, of a rubber tube, a groove on the front edge of said door in which said tube is located, a rod passing through said tube and secured to the door for holding said tube in position in said groove, and a groove in the frame for receiving said tube upon the closing of said door.

6. In a door-guard, the combination with a door, and its frame, of a rubber tube, a groove on the front edge of said door in which said tube is located, a rod passing through said tube and secured to the door for holding said tube in position in said groove, a groove in the frame for receiving said tube upon the closing of said door, and holding clamps at the top and bottom of said tube.

608,621. DEVICE FOR OPERATING RAILROAD-GATES. JOHN D. CAMPBELL and MELLROY R. CORNELIUS, Paris, Me.; said Campbell assignor of one-eighth to Foster M. Haskell, Boston, Mass. Filed June 10, 1897. Serial No. 641,402. (No model.)

Claim.—1. The herein-described device for operating railroad-gates consisting of a pivoted lever adapted to be struck by a passing train, a horizontal beam weighted at each end, a pair of pivots for supporting said beam, one on each side of the center, mechanism connecting said lever with the ends of said beam for lifting the same alternately by a movement in opposite directions and mechanism connecting the ends of said beam with the gate whereby the latter is opened by the lowering of one end of said beam and closed by the lowering of the other end.



2. The herein-described device for operating railroad-gates consisting of a pivoted lever adapted to be struck by a passing train, a horizontal beam weighted at each end, a pair of pivots for supporting said beam, one on each side of the center, mechanism connecting said lever with the ends of said beam for lifting the same, operating mechanism connecting the ends of said beam with the gate and a dash-pot beneath each end of said beam to retard its downward movement.

3. The herein-described device for operating railroad-gates consisting of a pivoted lever adapted to be struck by a passing train, a horizontal beam weighted at each end, a pair of pivots for supporting said beam, one on each side of the center, flexible cords or guides connecting said lever with the ends of said beam for lifting the same, and flexible cords or guides connecting the ends of said beam with the gate so arranged that the falling of one end of said beam opens and the other closes said gate.

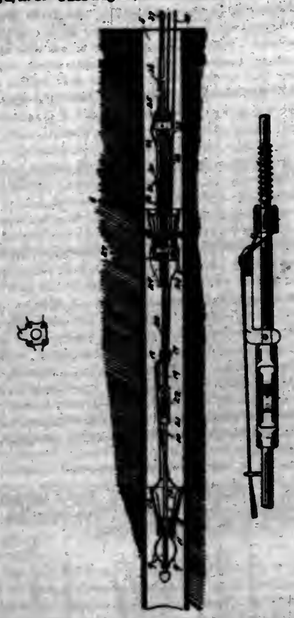
4. In a device for operating railroad-gates, the combination of a disk journaled in a horizontal position, ball-bearings for supporting the same, a lever pivoted to said disk and connected therewith by a yielding connection, a horizontal beam weighted at each end, a pair of pivots for supporting said beam, one on each side of the center, flexible cords or guides connecting said disk with the ends of said beam for lifting the same and mechanism connecting the ends of the said beam with the gate.

5. In a device for operating railroad-gates the combination of a pivoted lever adapted to be struck by a passing train, a horizontal beam weighted at each end, a pair of pivots for supporting said beam, one on each side of the center, mechanism connecting the ends of the said beam for lifting said ends, mechanism connecting the ends of said beam with the gate, a dash-pot and a piston and piston-rod therefor beneath each end of said beam for retarding its downward movement and means for keeping said piston-rod pressed upward against the end of said beam.

608,622. APPARATUS FOR SIZING AND DRESSING HANK-YARN. BERNHARD CORNEIL, Grevenbruch, Germany. Filed Dec. 21, 1897. Serial No. 662,893. (No model.) Patented in Italy June 27, 1896, No. 275; in France Sept. 21, 1896, No. 260,451; in Belgium Sept. 26, 1896, No. 117,634; in Austria-Hungary Nov. 2, 1896, No. 20,666 and No. 20,669; in Germany Nov. 5, 1896, No. 96,794, and July 24, 1897, No. 92,427, and in England Oct. 26, 1896, No. 23,962.

Claim.—1. In a hank-sizing machine comprising the tank, the rotary frame, the set of cylinders journaled in said frame, the second set of cylinders journaled in movable bearings and adapted to be moved toward and from the first set to permit the insertion and removal of the hanks, and means for intermittingly rotating the frames and for rotating the cylinders when the frames are stationary, substantially as described.

2. In combination, the tank, the rotary frame, the set of cylinders journaled in said frame, the second set of cylinders journaled in bearings movable toward and from the first set of cylinders, means for intermittingly rotating the frame, and for rotating the first set of cylinders during the period when the frames are stationary, and means for holding the movable cylinders away from the first set of cylinders during the major portion of the rotation of the frame and for bringing them into proximity to permit the removal of the sized hanks and the supplying of fresh ones to the cylinders, substantially as described.



3. In combination, the tank, the rotary frame, the set of cylinders journaled therein, the sprocket-wheels carried by the shafts of said cylinders, the sprocket-chain passing over said wheels and over an idler-wheel serving to hold the chain removed at one point in the path of said sprockets as the frame rotates, the second set of cylinders movable toward and from the first set, means for driving said sprocket-chain to rotate the frame, and means for holding the frame stationary while the movement of the chain continues whereby the cylinders are rotated, substantially as described.

4. In combination, the tank, the rotary frame, the set of cylinders journaled therein, the second set of cylinders journaled in bearings movable toward and from the first set, said first and second sets being arranged in pairs to carry the hanks to be sized, means for intermittingly rotating the frame and for rotating the cylinders when the frame is stationary, the carding-rolls arranged to lie normally in the path of the hanks, and means for automatically moving said carding-rolls out of said path as each cylinder approaches in the rotation of the frame, substantially as described.

5. In combination, the tank, the rotary frame, the set of cylinders journaled therein, the second set of cylinders journaled in bearings movable toward and from the first set, said first and second sets being arranged in pairs to carry the hanks to be sized, means for intermittingly rotating the frame and for rotating the cylinders when the frame is stationary, the rocking arms carrying carding-rolls, quadrants carried by the shafts of said rocking arms to cause their simultaneous movement, an arm carried by one of said shafts, and cams carried by the rotary frame adapted to lift said arm to remove the carding-rolls from the path of the cylinders, substantially as described.

6. In combination, with the tank and the rotary frame carrying a series of cylinders arranged in pairs and adapted to receive the hanks to be treated, with means for rotating the frame and cylinders, a roller covered with spirally-arranged points or projections adapted to engage the material and be frictionally driven thereby, substantially as described.

608,628. CONDUIT-WIRING MACHINE. WILLIAM R. COWAN, Brooklyn, N. Y. Filed Aug. 27, 1897. Serial No. 649,781. (No model.)

Claim.—1. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrying section, a rod and clutches whereby each of the aforesaid sections may be rigidly attached to the interior of a conduit, and means whereby the sections may be alternately introduced within said conduit, by means of said rod, and means whereby said clutches can be withdrawn from contact with the conduit, substantially as shown and described.

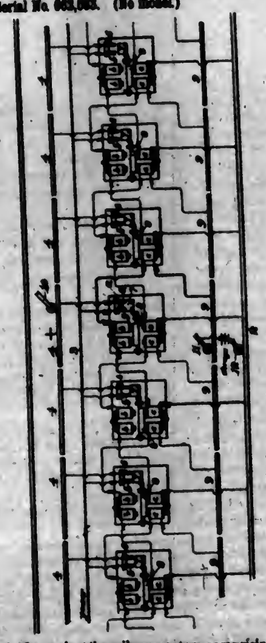
2. In a conduit-wiring machine, a guide-section, runners thereon, a rope-carrier, a rod carrying said guide and said runners, clutches on said guide and said carrier respectively, and means whereby said guide and said carrier may be forced alternately within a conduit, substantially as described.

3. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope-carrier sections respectively, means whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, substantially as described.

4. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope-carrier sections respectively, springs whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, substantially as described.

5. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope carrier sections respectively, means whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, sliding collars, connections between said collars and the said

fingers, and means whereby when said guide and said rope-carrier sections are brought together, said collars will slide to compress said fingers, substantially as shown and described.

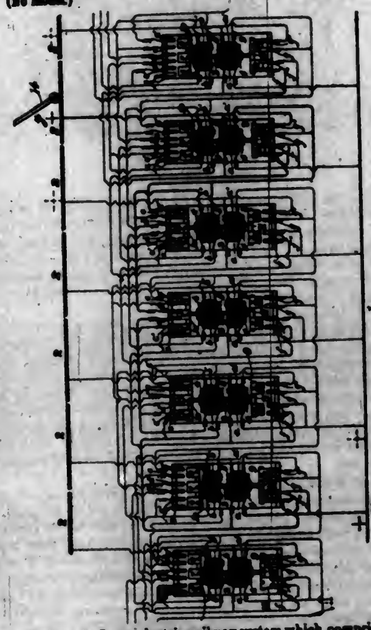


6. In a conduit-wiring machine, a guide-section, runners thereon a rope carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope-carrier sections respectively, means whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, sliding collars, connections between said collars and the said fingers, a rod attached to one of said collars and projections on the rope-carrier, substantially as shown and described.

7. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope-carrier sections respectively, means whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, sliding collars, connections between said collars and the said fingers, and means whereby when said guide and said rope-carrier sections are brought together, said collars will slide to compress said fingers, and means whereby said collars automatically release said fingers when said sections are separated, substantially as described.

8. In a conduit-wiring machine, a guide-section, runners thereon a rope-carrier section, a rod carrying said guide-section, clutches consisting substantially of fingers pivoted to said guide and rope-carrier sections respectively, means whereby said fingers automatically expand into contact with the conduit, and means whereby said guide and rope-carrier sections may be forced alternately within said conduit, sliding collars, connections between said collars and the said fingers, and means whereby when said guide and said rope-carrier sections are brought together, said collars will slide to compress said fingers, and springs whereby said collars automatically release said fingers when said sections are separated, substantially as described.

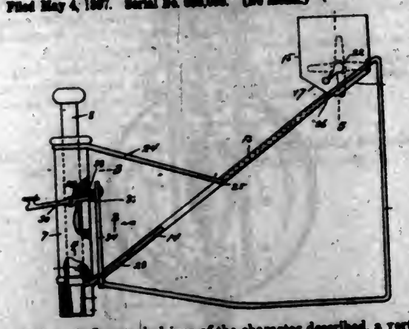
9. In a conduit-wiring machine, a guide-section, runners thereon a rod carrying said section, a pulley thereon, a rope-carrier section, a pulley thereon, clutches on said guide and said rope-carrier sections, and means as ropes 28, 36, attached respectively to said rope-carrier and said rod, and passing over said pulleys respectively, whereby said sections may be alternately forced within the conduit, substantially as described.



603,624. ELECTRIC RAILWAY. ERNST C. CROCKER, Bridgeport, Conn., assignor of one-half to Edwin C. Howe, same place. Filed Sept. 17, 1897. Serial No. 652,053. (No model.)

Claim.—1. In an electric-railway system comprising a power-collector carried by the car, insulated power-collecting sections, a supply-conductor, and the rails on which the car travels, the combination of a second series of insulated rail-sections, the series of single magnets and the series of pair magnets arranged opposite each other, the armatures within the fields of these oppositely-arranged magnets and carrying switches, the contact-points connected respectively with the power-collecting sections and the supply-conductor, and the storage battery carried by the car and provided with a shoe capable of traveling on said second series of sections, said magnets being in separate branch circuits comprising one of the single magnets and two single magnets from the pair magnets immediately succeeding and preceding the single magnets, the terminals of these circuits being connected respectively with said second series of sections and one of the car-rails, substantially as set forth.

2. In an electric-railway system comprising a supply-conductor, insulated power-collecting sections, and a power-collector carried by the car, the combination of the two series of magnets composed respectively of single magnets and pair magnets arranged opposite to each other and connected in separate branch circuits comprising one of the single magnets and two magnets selected from the pair magnets which immediately succeed and precede the single magnet in each instance, the insulated sections 9 and the car-rail 2 with which the terminals of said circuits are connected, the armatures within the fields of the oppositely-arranged magnets and carrying switches, the insulated contacts connected respectively with the power-collecting sections and with the supply-conductor, and the storage battery carried by the car and operating through the sections 9 to energize said magnets whereby the switches are operated, substantially as set forth.



603,625. ELECTRIC RAILWAY. ERNST C. CROCKER and EDWIN C. HOWE, Bridgeport, Conn. Filed Sept. 17, 1897. Serial No. 652,045. (No model.)

Claim.—1. In an electric-railway system which comprises a supply-conductor, insulated third-rail sections, and a power-collector carried by the car, the two series of magnets each series comprising pairs of separate magnets arranged opposite each other, single magnets selected from each quarternate couplet of one series being connected in circuit with single magnets selected from alternate couplets of the other series intervening between said quarternate couplets, whereby branch circuits are formed, and connections with said conductor and sections through intermediate circuit closers and breakers operated by said magnets whereby the section having contact with the collector is in closed circuit while the sections immediately succeeding and preceding are in circuits capable of being closed by the collector, substantially as set forth.

2. In an electric-railway system which comprises a supply-conductor, insulated third-rail sections, and a power-collector carried by the car, the two series of magnets each series comprising pairs of separate magnets arranged opposite each other, single magnets selected from each quarternate couplet of one series being connected in circuit with single magnets selected from alternate couplets, whereby branch circuits are formed, connections with said conductor and sections through intermediate circuit closers and breakers operated by said magnets whereby the section having contact with the collector is in closed circuit while the sections immediately succeeding and preceding are in circuits capable of being closed by the collector, and shunt devices tapped into connection with the coils of said magnets and automatically operated by said circuit closers and breakers whereby the current is shunted from said magnets after the latter have performed their function and is directed in practically a straight course between the supply-conductor and the various insulated sections, substantially as set forth.

603,626. TACK-DRIVER. CHARLES W. KAHER, Denver, Colo. Filed May 4, 1897. Serial No. 635,998. (No model.)

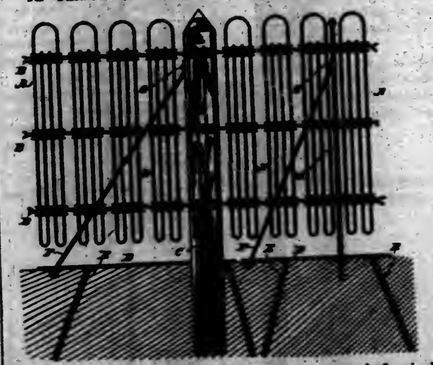
Claim.—1. In a tack-driver of the character described, a vertically-movable plunger provided at the upper end with a head, a lever pivotally mounted on the casing in which said plunger is mounted and provided with a cross-bar adapted to engage a pin secured to said plunger whereby the same may be elevated, a plate secured to said pin of the plunger and adapted to move therewith, said plate being suspended in a way and being provided with an opening adapted to permit the passage of tacks from said way when the said plate is in a predetermined position, and means for placing tacks in said way, substantially as and for the purpose described.

2. In a tack-driver, the combination with a driver, of a receptacle having the bottom inclined toward said driver, and a slot therein open at one end only, a shaft revolubly mounted in said receptacle, means for revolving the same, a plurality of push-arms mounted on said shaft and adapted to project through said slots successively, and an inclined way in the same straight line with the bottom of said slot, having a slot therein adapted to register with the open end of said first-named slot whereby a passage-way for tacks is formed connecting said receptacle and said driver, substantially as described.

603,627. AXLE-BEARING. CLAY FAULKNER, McMinnville, Tenn. Filed Dec. 17, 1897. Serial No. 662,515. (No model.)

Claim.—1. The combination with a support, and revoluble axles extending from a point at or near the longitudinal center of the vehicle outward in opposite directions, of bearing-sleeves having ball-and-socket connection with the support, in which the axles turn.

2. The combination with a support and an axle, of a collar secured to the end of the support and having depending ears, a bearing-sleeve having an adjustable bearing between said ears, a pin projecting from said bearing-sleeve, a brace secured to said collar and having a hole for the reception of said pin, substantially as set forth.



3. The combination with a support and an axle, of a collar secured to the end of said support, ears depending from said collar and having notches in their free ends, a bearing-sleeve having an adjustable bearing between said ears, a brace having its end disposed in the notches in the ears, and a yoke securing said brace to the collar, substantially as set forth.

4. The combination with a support and an axle, of a collar on said support provided with depending ears and having a curved recess between said ears, a bearing-sleeve for the axle, a curved enlargement between the ends of said bearing-sleeve and having a bearing in said curved recess in the collar, a brace secured to the ends of said ears and having a hole and a pin projecting from said curved enlargement and entering said hole in the brace, substantially as set forth.

5. The combination with a support and a revoluble axle, of separable blocks secured to the support near its center, each block having a curved recess in its inner face, and a bearing-sleeve for the inner end of the axle, having a spherical enlargement disposed in said recessed blocks, substantially as set forth.

6. The combination with a support and a revoluble axle having an annular recess at or near its inner end, of recessed blocks secured to the support and a sectional bearing-sleeve having a spherical enlargement to cooperate with the recessed blocks to form a ball-and-socket joint, said sectional bearing-sleeve being disposed in the annular recess in the axle, substantially as set forth.

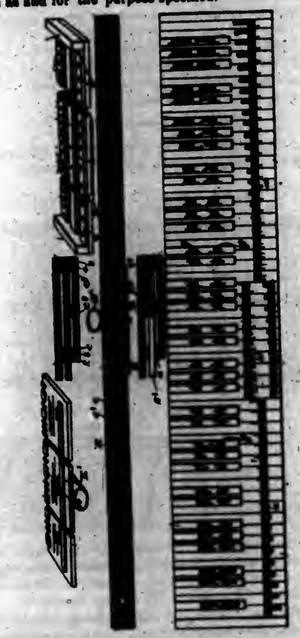
603,628. FENCE. THOMAS B. FREEMAN, Jr., Waynesborough, Pa. Filed Oct. 5, 1897. Serial No. 654,562. (No model.)

Claim.—1. In combination, a fence-picket composed of a single length of wire bent to form a number of parallel strands more than two in number, and clips of sheet metal passed upon the strands during the formation of the picket, in the manner described.

2. A fence-picket composed of a single length of wire bent to produce a number of strands parallel with each other and more than two in number, and clips of sheet metal having side flanges with holes therethrough, said strands being passed through said holes in the manner described.

3. A fence-picket composed of a single length of wire bent to produce a number of strands parallel with each other and more than two in number, and clips of sheet metal E-shaped in cross-section producing flanges, through which said strands are passed in the manner described, and means for preventing a longitudinal movement of the clips, substantially as set forth.

4. In combination with a picket of the character described, a clip composed of sheet metal so bent as to provide flanges through which the strands of said picket are adapted to pass, said clip having slots formed therein, with which bent portions of the picket-strands may be engaged, and end strips formed with the clip in engagement with the side strands of the picket, as shown and described.



5. As a new article of manufacture, a picket consisting of a single length of wire so bent as to form a number of strands lying parallel with each other, a series of clips formed of sheet metal and passed upon the picket during its formation, and so secured as to hold the elements of the picket rigid relative to each other, as specified.

6. A fence-picket composed of a single length of wire bent to produce a number of strands parallel with each other and more than two in number, and clips of sheet metal E-shaped in cross-section producing flanges, said clips being slotted, said strands being passed through said flanges and bent or bulged into the slots, as and for the purpose set forth.

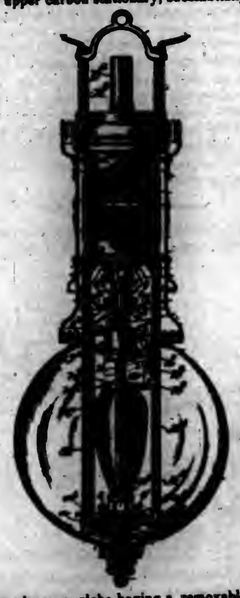
603,629. SEPARABLE OBJECT-LESSON KEYBOARD. EUSTACE A. FLEMMING, Toronto, Canada. Filed Apr. 13, 1897. Serial No. 631,988. (No model.)

Claim.—1. A device for teaching pianoforte comprising the separable white and black keys having the staves and notes of the musical notation inclined thereon, depending projections on the white keys, a base, longitudinal strips thereon with holes to receive the depending projections, depending projections on the black keys, the rear strip provided with holes between the white keys designed to receive the projections on the black keys and a longitudinal strip supported on the base and designed to form a rest for the front ends of the black keys at and for the purpose specified.

2. In combination the separable white and black keys, the base for supporting the same, a cover-board provided with intervening blocks to fit between the black keys and rest upon the white keys at the rear and a longitudinal strip attached to the cover designed to rest upon the white keys immediately in front of the black keys and means for holding the cover to the keyboard so as to retain the keys in position as and for the purpose specified.

3. In combination the separable white and black keys, the base for supporting the same constructed in two parts and hinged together, a cover-board formed in two parts, a flexible elongated loose connection between the parts designed to allow of the two parts of the base being folded on each other and fastening devices for connecting the free ends of the cover and base together as specified.

608,680. ELECTRIC-ARC LAMP. FREDERICK A. GILBERT, Brookline, and EMIL O. LEUDER, Beaumont, Mass. Filed July 1, 1897. Serial No. 643,123. (No model.)



Claim.—1. In an arc-lamp, a feed-controlling clutch including rotatable members to directly engage the carbon, rocking carriers for said members, brakes mounted on the carriers to prevent rotation of and press said members against the carbon, and an actuator to operate the carriers and control the brakes to thereby raise and lower the clutch bodily, substantially as described.

2. In an arc-lamp, a feed-controlling clutch including rotatable members adapted to directly engage the carbon, rocking carriers for said members, brakes mounted on the carriers, and an actuator to throw the operation of the brakes and thereby throw the clutch into and out of operation and also to raise and lower the same bodily, combined with an adjustable stop to effect release of the carbon at a predetermined point, substantially as described.

3. In an arc-lamp, a feed-controlling clutch comprising rotatable contact members, rocking carriers therefor, brakes mounted on said carriers, to press the contact members against the carbon and prevent their rotation, a tubular actuator in which the upper carbon is freely movable, and connections between said actuator and carriers, to operate the latter and thereby regulate the feed of the carbon, substantially as described.

4. In an arc-lamp, the lamp-body, a depending guide having a longitudinally-slotted, tubular extension through which the upper carbon is loosely extended, combined with a controlling-clutch for said carbon, comprising rotatable contact members, rocking carriers therefor, a support for said carriers, adapted to slide on the tubular extension, brakes on the carriers to act upon and press the contact members against the carbon, a clutch-actuator, and connections between it and the carriers, to operate, substantially as described.

5. In an arc-lamp, a globe having a removable cover, through which the carbon passes, and means to lift the cover and retain it lifted from the globe for trimming, the cover when lifted engaging and holding the upper carbon stationary, substantially as described.

6. In an arc-lamp, a globe having a removable cover through which the carbon is normally adapted to freely pass, a lifting-arm to which said cover is pivotally jointed, and a detent to retain said arm and cover lifted, the cover when lifted inclining to the horizontal and engaging the upper carbon to prevent its downward movement, substantially as described.

7. In an arc-lamp, a globe cover having a central upturned hub exteriorly threaded at its upper end, a disk having an opening in which the carbon snugly fits, and a downturned, outwardly-bent flange on said disk, threaded to engage the hub of the cover, the bent portion of the flange permitting lateral movement of the disk after separation of the said threaded portions, substantially as described.

8. In an arc-lamp, a globe-cover having a central upturned hub, a cooperating disk having an opening in which the carbon snugly fits, and means to retain the disk on the cover while permitting free lateral movement about the hub, substantially as described.

9. In an arc-lamp, a globe-cover having a central opening through which the carbon loosely passes, a cooperating disk apertured to snugly receive the carbon, and a detachable connection between the cover and disk, permitting relative lateral movement thereof without separation, substantially as described.

10. In an arc-lamp, a controlling-clutch for and to directly engage the carbon, a longitudinally-movable tubular actuator therefor in which the carbon is freely movable, a cut-out circuit in which said actuator is included, and a circuit-controller one member of which is fixed and the other mounted on the actuator, movement of the actuator to separate the carbons in starting the lamp breaking the cut-out circuit, substantially as described.

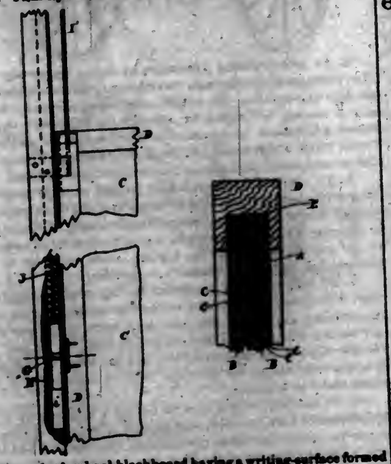
11. In an arc-lamp, an open cylindrical body, series-wound and shunt coils inclosed therein, and a resistance-coil wound upon the exterior of said body and insulated therefrom, whereby said resistance-coil is supported independently of the series and shunt coils, substantially as described.

12. In an arc-lamp, a cylindrical body, series-wound and shunt coils inclosed therein, a resistance-coil wound upon the exterior of said body and in shunt with the series coil, and a sliding regulator to adjust the resistance, substantially as described.

13. A contact device for electric-lamp carbons, comprising a supporting member, and a plurality of independent gravity contact members mounted to rock about their lower ends, said lower ends resting on the bottom of the supporting member, the upper portions of said members having enlargements on their inner faces adapted to rest against the surface of the carbon, substantially as described.

14. A contact device for electric-lamp carbons, comprising a tubular support having a centrally-apertured base, a plurality of independently-movable gravity contact members, mounted at their lower

ends on said base and radially disposed around the aperture therein, adapted to rock on their lower ends and move their upper portions into contact with the carbon, and a stop to engage the upper ends of said contact members and limit their inward movement, substantially as described.



15. A contact device for electric-lamp carbons, comprising a tubular support having a centrally-apertured base, and a series of radially-disposed gravity contact members mounted on said base and normally moved by gravity toward the longitudinal axis of the support, the lower ends of said members resting on the base adjacent the tubular support, substantially as described.

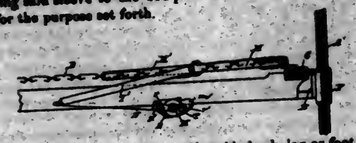
16. In an arc-lamp, a main body portion, depending arms connected at their lower ends, clamp-screws on said connection, and a lower-carbon holder provided with oppositely-turned, hooked ears to engage and be held in place by said clamp-screws, substantially as described.

17. In an arc-lamp, a detachable lower-carbon holder having a globe-socket and oppositely-turned hooked ears, combined with a support having clamp-screws to be engaged by said ears, to retain the holder in place, substantially as described.

18. In an arc-lamp, the main body portion, depending arms connected at their lower ends by a cross-bar, a hub thereon longitudinally slotted at one side, and a lower-carbon holder detachably mounted on the cross-bar, substantially as described.

608,681. BLACKBOARD. GOTTFRIED GLASHAGEN, Remo, Germany. Filed Apr. 20, 1897. Serial No. 633,214. (No model.)

Claim.—1. A school-blackboard having a writing-surface formed by a mixture of Japan lacquer and reduced kieselguhr rubbed or polished, substantially as herein specified.



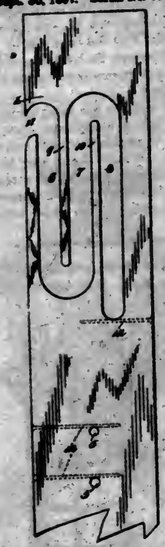
2. A school-blackboard comprising a section of wood or cork felt having a layer of leather-board cemented thereto by soluble glass and faced with a mixture of Japan lacquer and reduced kieselguhr in two or more layers, rubbed or polished, substantially as herein specified.

3. In a school-blackboard, the combination of a plate A of wood-felt or cork-felt, which is covered with two leather-boards cemented thereto by means of water-glass under the application of pressure, upon which boards B, B, the writing-surfaces C C are formed of layers of Japan lacquer and kieselguhr, the whole being firmly fixed in a wood frame D, substantially as herein specified.

4. In a blackboard, the within-described board A B, D, mounted by means of the pins G, in bearings H, which latter are guided in grooves i of the stand I, and suspended by means of contractile helical springs J, whereby the weight of the board is approximately balanced and its raising and lowering is more easily effected, in combination with the hooks and toothed racks for engaging said board, all arranged for joint operation, substantially as herein specified.

608,682. INVALID-BEDSTEAD. ARABEL J. GOODWIN, Brooklyn, Mass. Filed Feb. 16, 1894. Renewed Oct. 11, 1897. Serial No. 654,877. (No model.)

Claim.—1. In a bedstead a tubular metal bed-post and a metal casing surrounding said bed-post combined with an adjustable non-divided sleeve fitting around said casing and means for adjustably securing said sleeve to the bed-post and bed-frame substantially as and for the purpose set forth.



2. In a bedstead having an adjustable back, leg or foot support and a lifting-frame pivoted to said support combined with a spring for automatically causing the said lifting-frame to be folded beneath the bed when the support is fully lowered substantially as and for the purpose set forth

3. In a bedstead an adjustable back leg or foot support and a lifting frame pivoted to said support combined with an adjusting-shaft connected to the lifting-frame a ratchet secured to said shaft and pivoted pawl engaging said ratchet and an adjustable friction device arranged on said shaft and adapted to be used as a locking device independently of the pawl-and-ratchet locking device substantially as and for the purpose set forth.

4. In a bedstead a main mattress combined with a leg or seat supporting adjustable mattress pivoted or connected to the former and a leg or seat supporting frame attached in one end to said adjustable mattress and pivoted at its other end to the side rails of the bed-frame substantially as and for the purpose set forth.

608,683. CLOTHES-LINE SUPPORT. JERRY S. GREEN, Maquoketa, Iowa. Filed Sept. 30, 1897. Serial No. 653,614. (No model.)

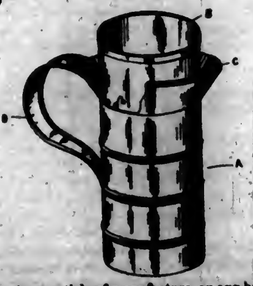
Claim.—1. In an extensible clothes-line prop, the combination with the relatively-slidable parts or members held together and directed in their movements, one of the sections being provided with a series of openings, of a catch applied to the other section to engage with any one of the openings to hold the parts in an adjusted position, and nails or pins driven into the section having the series of openings so as to come to one side of the said openings to reinforce them and receive the wear and strain of the catch, substantially as and for the purpose set forth.

2. A clothes-line support having a line-receiving slot of a zigzag or serpentine form, comprising inner and outer slots separated by an intermediate part, the inner slot being closed at its lower end and the outer slot having communication with the upper end of the inner slot and having a passage extending through the edge of the support, substantially as specified.

3. A clothes-line prop having a series of straight parallel slots in communication at opposite ends, the outermost slot having a passage communicating with its upper end, substantially as and for the purpose set forth.

4. An extensible clothes-line prop constructed substantially as herein specified, comprising relatively-slidable strips, the one having a series of openings and a line-receiving slot, the latter consisting of

a series of straight parallel slots in communication at opposite ends, and having a passage leading from the upper end of the outermost slot through the edge of the strip in a downwardly and outwardly inclined direction, nails or pins driven into the edge of the said strip to reinforce the series of openings thereof and the inner closed end of the line-receiving slot, loops or guides spaced apart and secured to the upper end portion of the other strip, and a spring-catch applied to the last-mentioned strip and located between the loops or guides to engage with the openings of the first-mentioned strip to hold the strips in an adjusted position substantially as set forth.

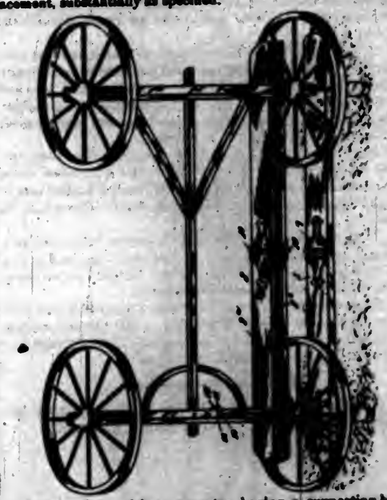


608,634. PUMP FOR INFLATING PNEUMATIC TIRES. AUGUSTUS GROSS, Sydney, New South Wales. Filed Nov. 26, 1897. Serial No. 659,913. (No model.)

Claim.—1. In an apparatus for automatically inflating tires the combination with the tire-tube, the valve-casing V connected with said tube and having an open end, the tire-pump having an open end adapted to be connected with the open end of the valve-casing, the pump-piston playing through the opposite end of said pump and means for reciprocating the pump-piston as the bicycle-wheel rotates, substantially as described.

2. In combination with the tire-tube, the valve-casing connected therewith, said casing having an enlarged open end, a pump having an open end threaded to engage the open end of the valve-casing, the plug threaded into the valve-casing and having grooved lower edge and central passage, the flexible band extending across the passage and having its ends secured to said grooved edges and means for operating the pump-piston as the wheel rotates, substantially as described.

608,635. EGG-BREAKING AND MEASURING UTENSIL. CARL M. HAGER, Worcester, Mass. Filed Aug. 14, 1897. Serial No. 648,232. (No model.)



Claim.—1. As an article of manufacture, an egg-breaking utensil comprising a breaking-collar and an upwardly-flaring drip-flange, said breaking-collar being perforated, substantially as described.

2. As an article of manufacture, an egg-breaking utensil, comprising a breaking-collar, an upwardly-flaring drip-flange of less height than said breaking-collar, said breaking-collar being perforated around a portion only of its periphery, substantially as and for the purpose set forth.

3. As an article of manufacture, an egg-breaking utensil comprising a graduated body portion A, an upwardly-extending breaking-collar B formed integrally therewith, and a flaring drip-flange C of less height than said breaking-collar, said breaking-collar having perforations located at its rear side, substantially as and for the purpose set forth.

608,636. AXLE-REPAIRING APPARATUS. WILLIS A. HARNER, Fairlie, Tex. Filed Sept. 13, 1897. Serial No. 652,154. (No model.)

Claim.—1. An axle-repairing apparatus, having a supporting-bar provided with spaced caps for supporting the extremities of the front and rear axle-spindles, in combination with means for securing the wheels which are mounted upon said spindles from accidental displacement, substantially as specified.

2. An axle-repairing apparatus, having a supporting-bar provided with spaced spindle-seats for supporting the extremities of front and rear axle-spindles, one of said seats being adjustable longitudinally of the bar, and means for securing the adjustable seat at the desired adjustment, in combination with means for clamping the wheels which are mounted upon said front and rear axle-spindles, to prevent accidental displacement, substantially as specified.

3. An axle-repairing apparatus, having a supporting-bar provided with seats to receive the extremities of the front and rear axle-spindles, one of which is adjustable longitudinally of the bar, means for securing the adjustable spindle-seat at the desired adjustment, and pivotal sills mounted upon the bar for lateral extension to prevent displacement thereof, substantially as specified.

4. An axle-repairing apparatus, having a supporting-bar provided with spaced seats to receive the extremities of front and rear axle-spindles, and pivotal sills fulcrumed in the transverse planes of said seats and adapted to be extended laterally to project beyond the side edges of the supporting-bar, said bar being of sectional construction and having its members hingedly connected for folding, substantially as specified.

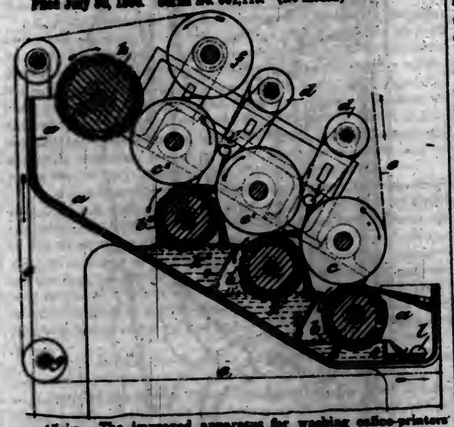
5. An axle repairing apparatus having a wheel-clamp provided with means for simultaneously engaging front and rear vehicle-wheels to prevent rotary movement thereof upon their spindles and also prevent pivotal movement of the front-wheel axle, in combination with means for seating the axles of the wheels when in an upright position, substantially as specified.

6. An axle-repairing apparatus having a wheel-clamp comprising sectional coöperating clamp-bars, the members of which are hingedly connected for folding in opposite directions, and adjusting devices for securing said bars in frictional contact with opposite sides of front and rear vehicle-wheels, in combination with means for seating the extremities of the axles of said wheels when said axles are in an upright position, substantially as specified.

7. In an axle-repairing apparatus, the combination with axle-supporting and wheel-clamping devices, of a plumb for indicating the vertical position of the wheel-axles, and means for attaching said plumb to an axle, substantially as specified.

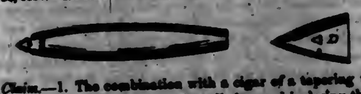
8. In an apparatus of the class described, the combination with axle-supporting and wheel clamping devices, of a plumb having a clip provided with front and rear arms connected by an expansion coiled spring and adapted to bear respectively upon opposite side surfaces of a wheel-axle, substantially as specified.

608,637. DIE FOR ROLLED FORGINGS. FRED H. HATHORN, Brewer, Me., assignor to the Eastern Manufacturing Company, same place. Filed Feb. 12, 1897. Serial No. 623,245. (No model.)



Claim.—1. In a device of the character described, a die consisting of a base-plate, cutting edges formed on the base-plate and diverging slightly and increasing in height, then extending horizontally and parallel to the end of the base, said cutting edges inclosing a groove gradually increasing in depth from the beginning to the end of the diverging edges, a raised surface formed at one side of the ridge having indentations and forming at the reduced end a plane surface between the ends of the indentations and raised portion, said plane surface tapering with the diverging wall, as and for the purpose described.

2. In a device of the character described, a base having cutting edges, serrations formed along the side of the base, and a smooth surface between the cutting edges and the serrations of equal height with the serrations, for the purpose described.



3. In a device of the character described, a base having the initial cutting edges starting separately a short distance back of the forward end of the base, serrations on the side of the base and a smooth surface of equal height with the serrations between said serrations and the cutting edges, as and for the purpose described.

608,638. APPARATUS FOR WASHING PRINTERS' BLANKETS. JOHN HAWORTH and JOHN P. LEMERA, Howtown, New Hills, England. Filed July 30, 1896. Serial No. 601,119. (No model.)

Claim.—The improved apparatus for washing online-printers' blanketing consisting of the inclined casing *a*, furnished with overflow compartments or pools, swilling and scrubbing brushes dipping into the said compartments, backing and guiding rollers to carry the blanketing, spout-pipes to supply water or other cleansing fluid, and a moisture-removing brush, all arranged combined and acting substantially as hereinbefore set forth and as illustrated.

608,639. CIGAR-TIP PROTECTOR. FREDERICK B. HARRIS, Louisville, Ky., assignor of one-half to Curran Pope, same place. Filed Jan. 14, 1897. Renewed Mar. 26, 1898. Serial No. 675,202. (No model.)

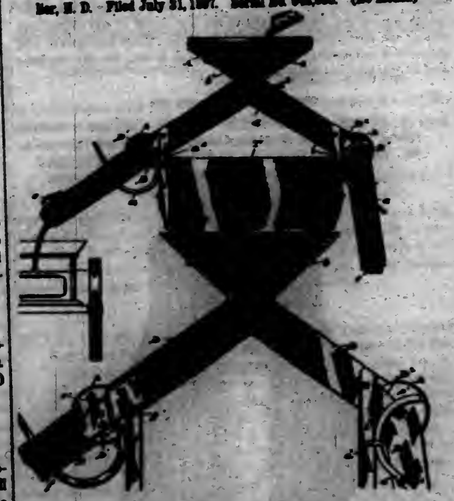
Claim.—1. The combination with a cigar of a tapering tip-protector having one end closed, and applied to and inclosing the small end of the cigar, said protector having points extending into the cigar between the closed end and the mouth of the tip-protector, and serving by the removal of the protector to break the tip from the cigar, substantially as described.

2. The combination with a cigar of a metallic tip of conical form, bent from sheet metal, and having points struck from its body between the large end and point, said points projecting into the cigar, substantially as and for the purpose stated.

3. In combination with a cigar, a metallic tip-protector of conical form embracing the cigar-tip, said protector having openings in its sides and having points or projections at the end of such openings and projecting into the body of the cigar, substantially as and for the purpose set forth.

608,640. BOTTLE OR JAR STOPPER. JOHN H. HENDERSON and RANDOLF P. KERSON, Bridgeton, N. J., assignors to Clement W. Shoemaker and Robert H. Shoemaker, same place. Filed Dec. 20, 1897. Serial No. 662,267. (No model.)

Claim.—1. In combination with a bottle or the like having a circumferential bead near its mouth, a cap having integral hooks S engaging the bead and a swinging bar pivoted to the cap near said hooks and in groove 4 and having at its free end a hook 13 directly engaging the bead to hold the cap upon the bottle-mouth, and a peak engaging seated in the cap and sealing the pivot-hole, substantially as described.



2. In combination with a bottle or the like having a circumferential bead near its mouth, a cap having integral hooks S and a horizontally-swinging bar pivoted to the cap near said hooks and having at its free end a hook, all said hooks engaging the bead directly to hold the cap upon the bottle-mouth, and said cap having a notch at its periphery opposite the cap-hooks and near the end of the bar to receive and hold the bar, substantially as described.

3. In combination with a bottle or the like having a circumferential bead near its mouth, a cap having integral hooks S and a swinging bar pivoted to the cap near said hooks and having at its free end a hook, all said hooks engaging the bead to hold the cap upon the bottle-mouth, and said cap having a notch opposite the cap-hooks to receive and hold the bar, substantially as described.

4. In combination with a bottle or the like having a circumferential bead near its mouth, a cap having integral hooks S and a swinging bar pivoted to the cap near said hooks and having at its free end a hook, all said hooks engaging the bead to hold the cap upon the bottle-mouth, and said cap having an inclined rib provided with a notch opposite the cap-hooks to receive and hold the bar, substantially as described.

608,641. MACHINE FOR LOADING GRAIN FROM THRESHING-MACHINES INTO WAGONS OR SACKS. JOHN HETROCK, Chester, N. D. Filed July 31, 1897. Serial No. 646,686. (No model.)

Claim.—1. In a grain-loader, the combination of the reservoir, the diverging chutes connected thereto, and the spouts hinged to the lower end of said chutes; with the hinged plates closing the space between the bottoms and tops of the chutes and spouts, respectively, for the purpose and substantially as described.

2. In a grain-loader, the combination with a thresher or separator, of a reservoir, and the opposite chutes connected thereto all adapted to be supported upon the top of the thresher so that the chutes lead to opposite sides thereof, and a valve for directing grain from the reservoir into either chute; with adjustable swinging spouts attached to the lower end of said chutes, and means for holding said spouts in the positions to which they may be adjusted, for the purpose and substantially as described.

3. The combination of the chute and the plates *c* attached to the lower end thereof, with the spout having circular enlargements on the ends of their sides hinged to said plates *c* and the swinging plate *g* hinged to the lower end of the chute, closing the space be-

tween the bottom of the chute and the spout, for the purpose and substantially as described.

4. The combination of the chute and the plates attached to the lower end thereof, with the spouts having circular heads on their ends hinged to said plates, the swinging plate hinged to the lower end of the chute closing the space between the bottoms of the chute and spout, and the curved plate hinged to the top of the chute and closing the space between the tops of the chute and spout, for the purpose and substantially as described.

5. The combination in a grain-loader, of a swinging spout, with the adjustable curved supporting-levers pivoted to the sides of the spout, for the purpose and substantially as described.

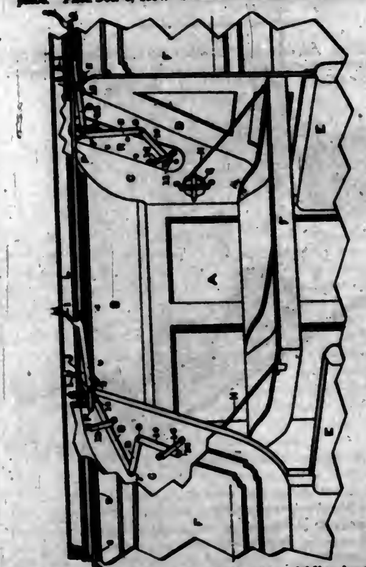
6. The combination in a grain-loader, of a chute, and a spout hinged to the lower end thereof; with the adjustable curved supporting-levers *a* pivoted to the sides of the spout, for the purpose and substantially as described.

7. In a grain-loader, the combination of a reservoir, the opposite chutes connected thereto and adapted to be supported upon the top of a thresher and lead to opposite sides thereof, and a valve for directing grain from the reservoir into either chute; with the swinging spouts hinged to the lower end of said chutes, the curved levers for holding said spouts in the positions to which they are adjusted and the valves for closing said spouts, for the purpose and substantially as described.

8. The combination in a grain-loader, of a reservoir, the diverging chutes communicating at their upper ends with said reservoir, and the spouts hinged to said chutes, with the plates hinged to the lower end of the chutes, closing the space between the bottoms of the chutes and spouts, and the plates hinged to the lower end of the chutes and closing the opening between the tops of the chutes and spouts, for the purpose and substantially as described.

9. In a grain-loader adapted to be mounted on a thresher or separator, the combination of a reservoir, diverging chutes communicating at their upper ends with said reservoir, the valve for directing grain from the reservoir into either chute, the plates attached to the lower ends of the chutes and projecting therefrom, and the spouts pivoted to said plates, with the plates hinged to the lower end of the chutes, closing the space between the bottoms of the chutes and spouts, the curved plates hinged to the lower end of the chutes and closing the opening between the tops of the chutes and spouts, and the curved supporting-levers pivoted to the spouts, for the purpose and substantially as described.

603,642. ANTIFRICTION-BEARING. CHARLES B. HOBSON, Boerne, Tex., assignor of one-third to Samuel S. Hyland, Philadelphia, Pa. Filed Apr. 7, 1897. Serial No. 631,132. (No model.)



Claim.—1. An antifriction-bearing, having at one end an end piece or cap formed on its outer face with an undercut ball-groove and with a passage for the insertion of balls leading to the periphery of the cap and formed on its inner face with an annular flange having a grooved edge to accommodate a series of balls, and balls arranged in said undercut groove.

2. An antifriction-bearing, having at one end an end piece or cap formed on its outer face with an undercut ball-groove and an annular rib surrounding said groove, and balls arranged in said undercut groove.

3. The combination with an axle-arm, of a hub, a sleeve secured within the hub, a series of rows of balls interposed between the axle-arm and the sleeve, a series of rings interposed between the rows of balls, and a cap at each end of the hub formed on its outer face with an undercut groove, and a passage for the insertion of balls leading to the periphery of the cap and formed on its inner face with an annular flange having a grooved edge to accommodate a series of balls interposed between the cap and one of the rings within the hub, and balls arranged in the undercut groove of the caps.

608,643. BERTH CURTAIN-ROD FIXTURE. JOHN KIRBY, Jr., Dayton, Ohio, assignor to the Dayton Manufacturing Company, same place. Filed Dec. 4, 1897. Serial No. 660,982. (No model.)

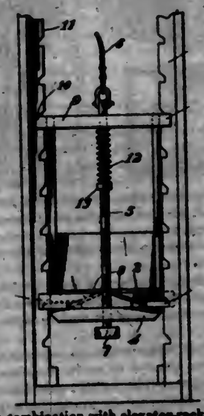
Claim.—1. For use in connection with a folding berth, a pair of brackets or arms, a curtain-rod secured to the outer ends thereof and adapted to be moved out into the deck-space when the berth is to be made up for use, and a receptacle formed on the adjacent car structure, the receptacle being in open communication with the deck-space to receive the rod and in which the latter is concealed from view when the berth is not in use.

2. In a berth curtain-rod fixture for sleeping-cars, a pair of brackets, slotted bushings fixed to the car structure and forming communication between the interior berth-space and the deck-space, and in which bushings the said brackets slide and have bearings, a curtain-rod secured to and movable with the brackets out into the deck-space when the berth is to be made up for use and when the berth is not in use adapted to be moved back out of the deck-space, in combination with a receptacle attached to or forming part of the woodwork of the deck for receiving and concealing the rod from view.

3. In a berth curtain-rod fixture, a curtain-rod secured to the outer ends of a pair of brackets adapted to slide through the apron-piece adjacent to the deck-rail, and whose inner ends are in pivotal connection with arms which are pivoted to the berth-partitions, whereby the said brackets with the attached rod may be drawn out into the deck-space when the berth is to be made up for use, and moved back out of the deck-space when the berth is not in use.

4. In a berth curtain-rod fixture, a curtain-rod secured to the outer ends of a pair of brackets whose said outer ends terminate in one or more hooks upon which clothing may be hung, and which brackets are adapted to slide through suitable openings in the car structure, and whose inner ends are in pivotal connection with arms pivoted to the berth-partition, whereby the said rod and the said brackets, together with the hooks formed thereon, may be drawn out into the deck-space when the berth is to be made up for use, and moved back out of the deck-space when the berth is not in use.

5. In a berth curtain-rod fixture, a pair of brackets, each of which is mounted on the inside of one of two berth-partitions and adapted to slide through suitable opening, cut through the apron-piece adjacent to the deck-rail, guides for said brackets, a curtain-rod secured at each end thereof to the outer ends of the brackets, whereby the said rod may be drawn out into the deck-space when the berth is to be made up for use, and a receptacle formed on the adjacent car structure: the receptacle being in open communication with the deck-space to receive the rod, and in which the latter is concealed from view when the berth is not in use.

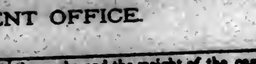


6. In a sleeping-car having a plurality of folding berths arranged in horizontal line with and separated from each other by suitable partitions, a pair of movable brackets arranged in each berth and connected together at their outer ends by a curtain-rod secured thereto, thus enabling the said brackets to be moved in unison, one or more hooks formed on the outer end of each of said brackets, and upon which to hang clothing, whereby each of said rods and its adjacent hooks may be separately drawn out into the deck-space when the berth is to be made up for use, and the rod moved back against the car structure when the berth is not in use, and whereby when the rod is in the latter position its accompanying hooks will cooperate with the hooks at the adjoining ends of the next fixtures to present the appearance of a group or cluster of such hooks mounted on the car structure.

7. As an improvement in berth curtain-rod fixtures for sleeping-cars, fixed end walls of a folding berth, a pair of brackets each of which is mounted on or adjacent to one of said walls on the inside thereof, slotted bushings secured to the car structure, and in which the said brackets have bearings and are adapted to slide, a curtain-rod secured to said brackets and connecting the same together at the outer ends thereof, whereby the brackets may be moved in unison and the rod drawn out into the deck-space, in combination with a suitable receptacle formed on the adjacent car structure and in which the rod may be stored when the berth is not in use.

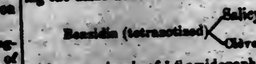
8. As an improvement in berth curtain-rod fixtures for sleeping-cars, fixed end walls of a folding berth, a pair of brackets pivotally connected with said walls by folding arms, slotted bushings secured to the car structure and in which the brackets have bearings and are adapted to slide, a curtain-rod secured to said brackets and connecting the same together at the outer ends thereof, whereby the brackets may be moved in unison and the rod drawn out into the deck-space, in combination with a suitable receptacle formed on the adjacent car structure and in which the rod may be stored when the berth is not in use.

9. In a sleeping-car having a folding berth adapted to close against the under side of the deck-rail or apron-piece adjacent thereto, a receptacle formed on the car structure above the berth, in combination with a curtain-rod for supporting curtains in front of the berth when the same is made up for occupancy and adapted to be stored in the receptacle when the berth is closed and not in use.



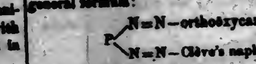
608,644. SAFETY ATTACHMENT FOR ELEVATORS. DAVID W. KNEPP, Bowman, Ill. Filed July 21, 1897. Serial No. 645,370. (No model.)

Claim.—The combination with elevator-racks, and a cage or car, of a slidable rod having a head at its lower end to limit its vertical movement with relation to the car, a spring acting against said rod, the dogs adapted for engagement with the racks, and the links attached to the rod and the dogs, the rod and dogs arranged to be moved by the spring for the dogs to have slight engagement with the racks and the weight of the cage acting on said links to force the dogs into complete engagement with the racks, substantially as described.



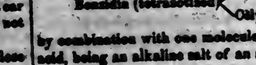
608,645. GREEN TRIBASO DYE. KARL KEHRMANN and EDUARD MARES, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Dec. 14, 1897. Serial No. 661,998. (Specimens.) Patented in Germany Sept. 15, 1891, No. 68,998; in England Dec. 28, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,253; in Italy June 30, 1892, XXVI, 28,191, LXIII, 136, and in Austria-Hungary Oct. 3, 1892, No. 1,949 and No. 16,870.

Claim.—1. The process for producing new triazo dyestuffs by combining the diazo derivatives of the diazo compounds hereinbefore defined of the general formula



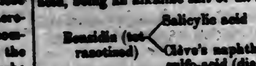
with one molecule of a mono or di sulfo acid of 1.8 amidonaphthol, substantially as hereinbefore described.

2. The process for producing a new triazo dyestuff by combining the diazo derivative of the diazo body having the formula



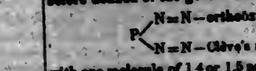
with one molecule of 1.8 amidonaphthol 2.4 disulfo-acid substantially as hereinbefore described.

3. As new articles of manufacture the new triazo dyestuffs obtainable from the diazo derivatives of the diazo compounds of the general formula:



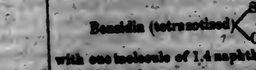
by combination with one molecule of a mono or di sulfo acid of 1.8 amidonaphthol, being black powders, soluble in water with green color, dyeing unmordanted cotton green shades substantially as described.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the diazo body having the formula



by combination with one molecule of 1.8 amidonaphthol 2.4 disulfo-acid, being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a black powder, soluble in water with a green color, in concentrated sulfuric acid with a dark-blue color from which solution a greenish-black precipitate is obtained on the addition of a sufficient quantity of ice, dyeing unmordanted cotton green shades substantially as described.



608,646. GRAY TRIBASO DYE. KARL KEHRMANN, EDUARD MARES, and ADOLF ISSAIS, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Dec. 14, 1897. Serial No. 661,958. (Specimens.) Patented in Germany Sept. 15, 1891, No. 68,998; in England Dec. 28, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,253; in Italy June 30, 1892, XXVI, 28,191, LXIII, 136, and in Austria-Hungary Oct. 3, 1892, No. 1,949 and No. 16,870.

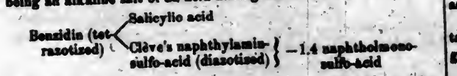
Claim.—1. The process for producing new triazo dyestuffs by combining the diazo derivatives of the diazo compounds hereinbefore defined of the general formula

with one molecule of 1.4 or 1.5 naphtholmonosulfo acid, substantially as described.

2. The process for producing a new triazo dyestuff by combining the diazo derivative of the body having the formula

with one molecule of 1.4 naphtholmonosulfo-acid substantially as described.

3. As new articles of manufacture the new triazo dyestuffs obtainable from the diazo derivatives of the diazo compounds of the general formula:



by combination with one molecule of 1.4 or 1.5 naphtholmonosulfo-acid, being dark powders, soluble in water with greenish-gray color dyeing unmordanted cotton greenish-gray shades substantially as described.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the body having the formula

by combination with one molecule of 1.4 naphtholmonosulfo-acid, being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a dark-brown powder, soluble in water with a greenish-gray color, in concentrated sulfuric acid with a blue-black color from which solution a black flaky precipitate is obtained on the addition of a sufficient quantity of ice, dyeing unmordanted cotton greenish-gray shades substantially as described.

608,647. GREEN TRISAZO DYE. KARL KEHRMANN, EDUARD MAERTZ, and ADOLF ISRAEL, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y.

Filed Dec. 14, 1897. Serial No. 661,856. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,262; in England Dec. 26, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,223; in Italy June 30, 1892, XXVI, 32,191, LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,948 and No. 16,570.

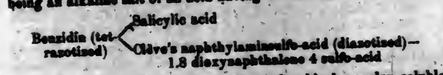
Claim.—1. The process for producing new trisazo dyestuffs by combining the diazo derivatives of the diazo compounds hereinbefore defined of the general formula

with one molecule of a 1.8 dioxynaphthalene mono or di sulfo acid substantially as hereinbefore described.

2. The process for producing a new trisazo dyestuff by combining the diazo derivative of the body having the formula

with one molecule 1.8 dioxynaphthalene 4 sulfo-acid, substantially as described.

3. As new articles of manufacture the new trisazo dyestuffs obtainable from the diazo derivatives of diazo compounds of the general formula



by combination with one molecule of a 1.8 dioxynaphthalene mono or di sulfo acid being black powders, soluble in water with green color dyeing unmordanted cotton green shades, substantially as described.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the body having the formula

by combination with one molecule 1.8 dioxynaphthalene 4 sulfo-acid being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a black powder, soluble in water with a green color which on the addition of alkalies turns into greenish black, in concentrated sulfuric acid with a blue-black color, from which solution a greenish-black flaky precipitate is obtained on the addition of a sufficient quantity of ice; dyeing unmordanted cotton green shades, substantially as described.

608,648. BROWN TRISAZO DYE. KARL KEHRMANN, EDUARD MAERTZ, and ADOLF ISRAEL, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y.

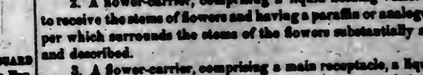
Filed Dec. 14, 1897. Serial No. 661,857. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,262; in England Dec. 26, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,223; in Italy June 30, 1892, XXVI, 32,191, LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,948 and No. 16,570.

Claim.—1. The process for producing new trisazo dyestuffs by combining the diazo derivatives of the diazo compounds hereinbefore defined of the general formula

with one molecule of alpha-naphthylamin or of a monosulfo-acid thereof, substantially as hereinbefore described.

2. The process for producing a new trisazo dyestuff by combining the diazo derivative of the diazo body having the formula

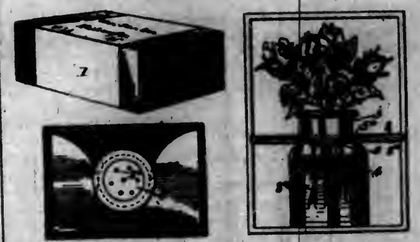
with one molecule of Clève's naphthylaminsulfo-acid, substantially as hereinbefore described.



3. As new articles of manufacture the new trisazo dyestuffs obtainable from the diazo derivatives of the diazo compounds of the general formula

by combination with one molecule of alpha-naphthylamin or of a monosulfo-acid thereof, being dark powders, soluble in water with dark-brown color, dyeing unmordanted cotton dark-brown shades which when treated with solutions of chromium and copper salts become faster to washing and against the action of light, capable of dyeing wool in acid-baths shades similar to those produced on cotton, substantially as described.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the diazo body having the formula

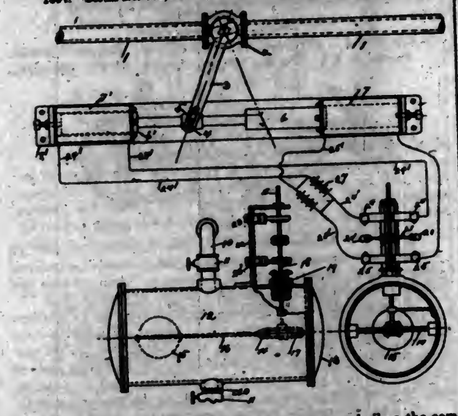


by combination with one molecule of Clève's naphthylaminsulfo-acid being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a dark-brown, nearly black, powder, soluble in water with a violet-brown color, in concentrated sulfuric acid with a bluish-black color from which solution a violet-black precipitate is obtained on the addition of a sufficient quantity of ice, dyeing unmordanted cotton violet-brown shades which when treated with solutions of chromium and copper salts become a dark brown with a yellowish hue and faster to washing and against the action of light, yielding on wool in acid-baths dark-brown shades, substantially as described.

608,649. FLOWER-CARRIER. GARRIE H. LIBBEY, Keuka, Fla.

Filed May 26, 1897. Serial No. 638,649. (No model.)



Claim.—1. A flower-carrier, comprising a main receptacle, a liquid-holding vessel adapted to hold cut flowers, and adjustable holders or guards fitted in a box and arranged to engage the said vessel and holding it in a fixed position within the box, substantially as shown and described.

2. A flower-carrier, comprising a liquid-holding vessel adapted to receive the stems of flowers and having a paraffin or analogous stopper which surrounds the stems of the flowers substantially as shown and described.

3. A flower-carrier, comprising a main receptacle, a liquid-holding vessel held therein adapted to receive the stems of the flowers, said vessel having a neck provided with a paraffin or analogous stopper, the body of the main receptacle having grooves in line with the base of the neck of the vessel, a holder or guards detachably held in such grooves having a concave seat to engage the neck of the vessel at a point just above the bulge or body of the bottle or vessel, designated as the base of the neck, and a lid for covering the box and keeping the holders more securely in place, substantially as shown and described.

608,650. AUTOMATIC ELECTRIC FEED-WATER REGULATOR. ANDREW E. MACOMBER and JOHN BERRY, Braddock, Pa.

Filed Dec. 2, 1897. Serial No. 660,669. (No model.)

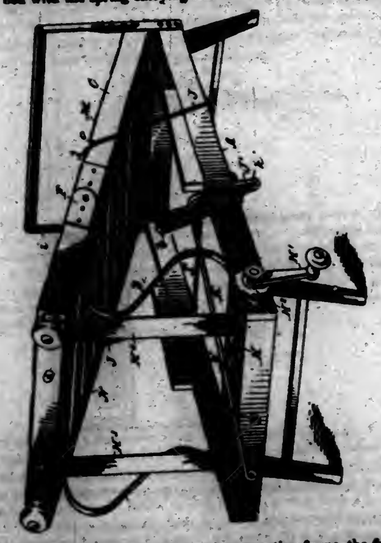
Claim.—1. In a feed-water regulator for steam-boilers, the combination with a cylinder connected with a boiler, a float arranged in said cylinder upon one end of a lever, a vertically-movable rod secured to the other end of said lever and carrying a pair of contact-points and a standard mounted upon the top of the cylinder carrying two pairs of contact-points and having arms in which said rod is guided, of the two solenoids having electrical connection with the two pairs of contact-points and adapted to operate to close or open a feed-water-pipe valve.

2. In a feed-water regulator for steam-boilers, the combination with a cylinder connected with a boiler, a float and rod movably mounted therein, a standard secured to the top of the cylinder and carrying two pairs of contact-points, and a vertically-movable rod mounted in said standard having its lower end connected to one end of the float-rod and carrying a pair of contact-points located thereon between the pairs of contact-points on the standard, of the two solenoids each of which has a separate electrical circuit between each pair of contact-points of the standard, said electrical circuits being operated by the float to open or close a valve in a feed-water pipe.

3. In a feed-water regulator, the combination with a cylinder secured on a pipe leading from a boiler to indicate the amount of water in the boiler, means therein operated by the rise and fall of the water, a rod carried by said means and carrying a pair of contact-points and adapted to be raised or lowered by said means, a bracket carrying two pairs of contact-points, said pairs each being on opposite sides of the pair carried by said movable rod and each pair adapted to cause an electric circuit when contacted by said single pair on the movable rod in its ascent or descent, of a pair of oppositely arranged and operated solenoids which move in the same direction simultaneously when the circuits are completed by the regulating means to open or close a valve in a feed-water pipe as the water is needed in the boiler.

608,651. ADJUSTABLE BED. HENRY H. HARTH, Howard, Ohio.

Filed Nov. 20, 1897. Serial No. 659,141. (No model.)



Claim.—1. The combination of the main supporting-frame, the frame of the adjustable bed hinged to the main supporting-frame, a hinged head portion, means for locking the hinges to rigidly connect the head portion with the foot portion of the bed, and springs for elevating the entire frame of the adjustable bed placed beneath the head portion thereof and attached to the main supporting-frame.

2. The combination of a main supporting-frame, a hinged adjustable bed-frame having a hinged head portion, and sliding bolts movable across the hinge of the head portion for locking the hinges, in combination with springs of sufficient strength to support the entire frame of the bed, and also the occupant thereof, placed beneath the head portion of the adjustable frame, and secured to the main supporting-frame.

3. The combination of the main supporting-frame, the vertically-adjustable bed and the spring-supporting frame detachably connected therewith.

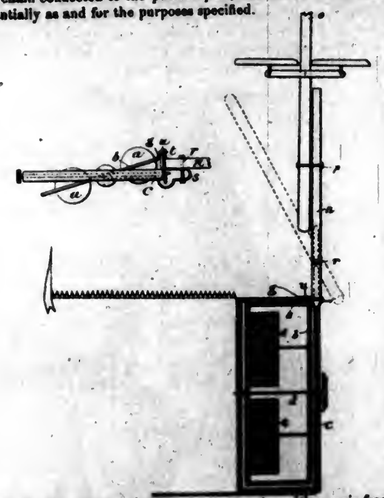
4. The combination of the main supporting-frame, the vertically-adjustable bed, means for holding it at the desired elevation, a frame provided with a series of rows of bed-springs, and means for detachably connecting the spring-carrying frame with the frame of the adjustable bed.

5. The combination of the main supporting-frame, the frame of the vertically-adjustable bed hinged thereto at the foot, a spring-carrying frame hinged to the frame of the adjustable bed at the foot thereof, a series of rows of bed-springs carried by said spring-carrying frame and bolts for connecting the frame of the vertically-adjustable bed with the spring-carrying frame.

6. The combination of the main supporting-frame, the frame of the vertically-adjustable bed provided with a hinged head-piece, sliding bolts for locking the hinges thereof, springs for elevating and supporting the bed, and also the occupant thereof, placed under the adjustable frame and secured to the main supporting-frame, a spring-carrying frame hinged at its foot to the frame of the vertically-adjustable bed, spring-bolts for connecting the spring-carrying frame at its opposite end to the head of the frame of the vertically-adjustable bed, a series of rows of springs carried by the spring-supporting frame, a windlass connected with said adjustable frame and ratchet mechanism for controlling the windlass.

7. The combination of the main supporting-frame, the hinged legs, the slotted frame at the foot of the bed provided with vertical rows of notches, studs or pins secured to the side rails of the frame, and adjustable in said notches means for elevating and depressing the bed at the head, the hooked arms adapted to engage notches on the side rails of the adjustable bed, the cross-rod to which they are connected, the crank on said cross-rod and a longitudinal operating-bar connected with said crank.

8. The combination of the main supporting-frame, the vertically-adjustable bed, the slotted notched frame secured to the foot end of the main supporting-frame, studs or pins on the foot of the vertically-adjustable bed extending into said slots and notches, and vertically adjustable thereto, a spring-carrying frame hinged to the foot end of the frame of the vertically-adjustable bed, a series of rows of springs carried by said frame, means for connecting the spring-carrying frame with the adjustable frame, supporting-springs carried by the main supporting-frame and arranged beneath the head of the adjustable frame, and windlass mechanism for controlling the elevation of the head of the bed.



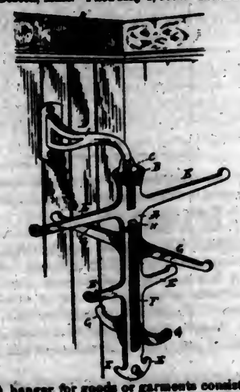
608,652. HARVESTING-MACHINE. JOHN C. MOORE, Eastbourne, England.

Filed Oct. 15, 1896. Serial No. 609,093. (No model.) Patented in France June 11, 1896, No. 257,168; in Germany June 16, 1896, No. 91,295; in Sweden June 20, 1896, No. 5,313; in Italy June 27, 1896, LXXXII, 279; in Norway July 3, 1896, No. 5,395; in Canada Sept. 25, 1896, No. 50,831, and in Spain Nov. 21, 1896, No. 19,981.

Claim.—1. In a harvesting-machine, the combination of a main frame, a wheel-frame pivoted thereto on an axis transverse to the line of draft, wheels mounted on transverse axles in the wheel-frame, and means for lifting one end of the wheel-frame around one of the axles as a fulcrum, substantially as described and for the purposes specified.

2. In a harvesting-machine, the combination with a main frame, a wheel-frame pivoted thereto on an axis transverse to the line of draft, wheels mounted on transverse axles in the wheel-frame, of a

draft-pole, an additional pivoted pole to which the draft-pole is hinged, and a chain connected to the pivoted pole, and to the wheel-frame, substantially as and for the purposes specified.



3. In a harvesting-machine, the combination with a main frame, a wheel-frame carrying centrally thereof two wheels connected pivotally to the main frame, a seat carried by the main frame at one side of the ground-wheels and a counterbalance-wheel at the other side of a draft-pole, a pivoted pole to which the draft-pole is hinged and a chain connected to the pivoted pole and to the wheel-frame and causing it to tilt when the draft-pole is turned, substantially as and for the purposes specified.

4. In a harvesting-machine, the combination of a main frame and a wheel frame pivoted thereto and contained within the main frame, said wheel-frame having pivoted therein two or more carrying-wheels on axes which are not coincident, of a driving-spindle, a rod or shaft driven from the said spindle, a clutch connected to the shaft throwing the mechanism in or out of operation, wheels on the shaft driving the cutting-knife and other parts of the apparatus and means by which the wheel-frame may be tilted around the axle of one of the wheels when the machine is turned, substantially as and for the purposes specified.

5. In a harvesting-machine, the combination with a main frame, a wheel-frame pivoted thereto and contained within the main frame, and a shaft forming the pivot and driving the mechanism of the machine, of a draft-pole, a pivoted pole hinged to the same, a chain connected to the pivoted pole and to the wheel-frame and pulleys in the main frame over which the chain passes, substantially as described and shown in the accompanying drawings and for the purposes specified.

603,653. HANGER FOR GOODS OR GARMENTS. FREEMAN HENDERSON, Boston, Mass. Filed May 1, 1897. Serial No. 634,735. (No model.)

Claim.—A hanger for goods or garments consisting in combination, a bracket or support, a pronged member A pivotally connected to said support, and having a vertical slot *a* and a pronged detachable auxiliary member F inserted through the slotted portion of the member A and adapted to be secured thereto when in use, substantially as and for the purpose set forth.

603,654. ATTACHMENT FOR BICYCLES. EDWARD H. HOBBS, Providence, R. I. Filed Mar. 15, 1897. Serial No. 627,675. (No model.)

Claim.—1. An attachment for bicycles comprising two arms 2 2 arranged to be clamped to a bicycle-frame and to receive the sprocket-chain between them, and a brush mounted to rotate between said arms and support said sprocket-chain, for the purpose set forth.

2. An attachment for bicycles comprising two arms 2 2 arranged to be clamped to a bicycle-frame and to receive the sprocket-chain between them, keyhole-slots in said arms having their narrow portions pointing away from the sprocket-chain, an axle having grooved ends held in said keyhole-slots, and a brush mounted to rotate on said axle and support said sprocket-chain, for the purpose set forth.

3. An attachment for bicycles comprising two arms 2 2 arranged to be clamped to a bicycle-frame and to receive the sprocket-chain between them, a brush mounted to rotate between said arms and support said sprocket-chain, and a lubricating device held between said arms and arranged to bear against the inner surface of the sprocket-chain, for the purpose set forth.

603,655. ACETYLENE-GAS GENERATOR. CALVIN OSBURN, Phœnix, Ariz. Filed July 19, 1897. Serial No. 645,188. (No model.)

Claim.—1. In an acetylene-gas generator, the combination with a tank, and a vertically-movable bell carrying a carbid-receptacle, of the storage and condensing chamber of conical form substantially from its lower end to the discharge-apex thereof, a condensing-pipe coupled at its lower end to said condensing and storage chamber to discharge directly into the same and with its upper end extended above the water-line in the tank, and an outlet-pipe leading from the lower part of said condensing-chamber and having a branch attached to the apex of said conical condensing and storage chamber, whereby the gas as it passes from the enlarged lower end to the discharge-apex of said chamber is checked and thereby compressed and also caused to impinge against the converging walls of the chamber, substantially as described.

2. In an acetylene-gas generator, the combination with a tank, and a bell carrying a carbid-receptacle, of a conical storage and condensing chamber united to the bottom of said tank and immersed in the water contained therein, a condensing-coil occupying the space between the tank and said conical chamber in compact relation thereto and coupled at one end directly to said chamber near the bottom thereof and having its other end extended above the water-line in said tank, an outlet-pipe coupled to the chamber and having a branch connection coupled to the discharge-apex of said chamber, and a draw-off cock from said chamber, substantially as described, for the purposes set forth.

3. In a gas-generator, the combination with a tank, and a vertically-movable bell, of a conical condensing-chamber situated in the tank below the water-level therein, a condensing-coil having its lower end connected to said condensing-chamber and its upper end terminating above the water-level, and a gas-outlet pipe attached to the apex of the condensing-chamber and leading therefrom through the tank, whereby the gas as it passes upward through the conical condensing-chamber impinges against the walls of said chamber and the watery vapor is eliminated from the gas and precipitated to the bottom of said tank, substantially as described.

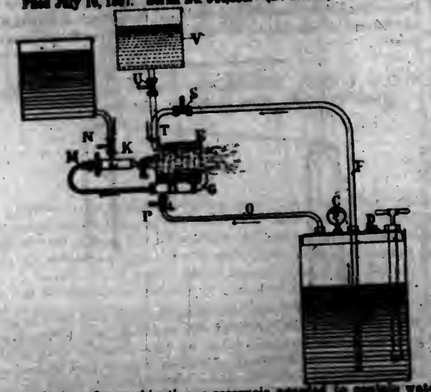
603,656. CONDUIT FOR RAILROADS. FRED S. PEARSON, Boston, Mass. Filed Sept. 14, 1897. Serial No. 651,534. (No model.)

Claim.—1. In a conduit for railroads, in combination, a trap in the top of the conduit; mechanism by which the trap is opened and closed; and an actuator arranged to be depressed by the car-wheel, whereby the trap mechanism is operated, substantially as described.

2. In a conduit for railroads, in combination, the trap 3 in the top of the conduit; levers 5 by which the trap is held in place and raised and lowered; mechanism whereby the levers are actuated in opening and closing the trap; and an actuator 12, arranged and adapted to be depressed by the car-wheel and to operate the mechanism for actuating the levers, substantially as described.

603,657. PROCESS OF MAKING ALKALINE ALUMINATES. DOMINIQUE A. PERRARDOT, Dolmuts, Belgium. Filed Dec. 15, 1897. Serial No. 662,068. (No specimens.) Patented in France Nov. 16, 1896, No. 261,786; in England Nov. 16, 1896, No. 28,032; in Germany Nov. 20, 1896, No. 98,038, and in Belgium Apr. 1, 1898, No. 139,067.

Claim.—1. The process of producing aluminates which consists in mixing aluminous matter and a sulfate with such an amount of carbon that only one-fourth of the oxygen present in the sulfate will be combined therewith, and calcining the mixture.

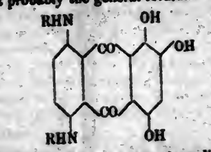


2. The process of producing aluminates which consists in calcining a mixture of an aluminous earth and a sulfate together with sufficient carbon to just reduce the ferric oxid and moisture plus one-fourth the amount of carbon necessary to combine with the oxygen in the sulfate in forming carbon dioxid.

3. The process of producing aluminates which consists in mixing aluminous matter with an alkaline sulfate with such an amount of carbon that only one-fourth of the oxygen in the alkaline sulfate will be combined therewith, and then calcining the mixture.

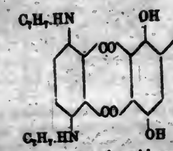
4. The process which consists in mixing bauxite with an alkaline sulfate and carbon in the proportions indicated by the formula $2(4Al_2O_3.Fe_2O_3)+6Na_2SO_4+5C$ and calcining the mixture.

5. The process which consists in mixing finely-comminuted aluminous matter, and alkaline sulfate and carbonaceous matter, the proportions of the carbonaceous matter being such that only one-fourth the amount of carbon necessary to combine with the oxygen of the sulfate is added, then heating the mixture to read heat, and finally extracting the resultant aluminate by lixiviation.



603,658. APPARATUS FOR HEATING BY MEANS OF LIQUID HYDROCARBONS. JEAN A. RAMBAUD, Paris, France, assignor to the Compagnie Internationale des Procédés Adolphe Saigle, same place. Filed July 16, 1897. Serial No. 644,880. (No model.)

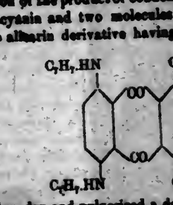
Claim.—In combination, a reservoir adapted to contain water and air, a pump for maintaining constant or substantially so the air under pressure in said reservoir, a retort connected with said water and air reservoir, a hydrocarbon-fluid reservoir, a sprayer or atomizer in connection with said hydrocarbon fluid reservoir, a receiver wherein steam from said retort and air from said reservoir are adapted to be stored, and valves whereof one is in the pipe leading to said receiver and whereof the other is in the pipe leading from said water and air reservoir, substantially as and for the purposes described.



603,659. DARK-GREEN ALIZARIN DERIVATIVE. ROBERT R. SCHMIDT, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Dec. 14, 1897. Serial No. 661,571. (No specimens.) Patented in Germany Oct. 14, 1894, No. 84,989; in France Dec. 3, 1894, No. 242,316; in England Dec. 6, 1894, No. 22,927, and in Italy Dec. 31, 1894, XXIX, 37,890, LXXIV, 304.

Claim.—1. The process for producing new dyestuffs being sulfo-acids of the condensation products obtainable from one molecule of alizarin pentacyanin and two molecules of a primary aromatic amin and having most probably the general formula

in which formula R represents an aromatic radical, such as phenyl, tolyl, xylyl, naphthyl, which process consists in sulfonating the said condensation products substantially as hereinbefore described.

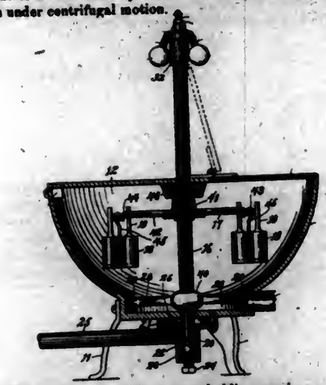


2. The process for producing a new dyestuff being a sulfo-acid of the condensation product obtainable from one molecule of alizarin pentacyanin and two molecules of paratoluidin and having most probably the formula:

which process consists in treating the said condensation product with sulfonating agents such as sulfuric monohydrate substantially as hereinbefore described.

3. As new articles of manufacture the new alizarin dyestuffs obtainable by sulfonation of the condensation products from one molecule of alizarin pentacyanin and two molecules of a primary aromatic amin; representing when dry and pulverized dark powders dissolving in water with a green color yielding loose alizarin pentacyanin if they are reduced by means of zinc-dust and diluted acetic acid and if the reduction products are heated with dilute sulfuric acid, dyeing unmordanted and chrome-mordanted wool green shades, yielding on chrome-mordanted cotton beautiful green shades fast to light, substantially as described.

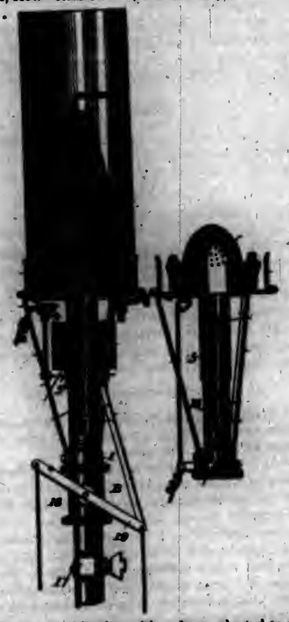
4. As a new article of manufacture the specific dyestuff obtainable by sulfonation of the product of condensation from one molecule of alizarin pentacyanin and two molecules of paratoluidin, being a sulfo-acid of the alizarin derivative having most probably the formula:



representing when dry and pulverized a dark-green powder dissolving in water with a green color, which changes into yellow on acidulating and adding zinc-dust, the filtered solution separating loose alizarin pentacyanin after heating with a small quantity of sulfuric acid, dyeing unmordanted and chrome-mordanted wool green shades fast to light, yielding on chrome-mordanted cotton green shades which are distinguished by their brightness and fastness against the action of light, substantially as described.

603,660. STEAM-MOTOR. FRED SEAVER, Lake Mills, Wis., assignor to the F. E. Fargo & Company, same place. Filed Mar. 3, 1897. Serial No. 625,627. (No model.)

Claim.—1. The combination with a large chambered case and a shaft-bearing member affixed to the bottom of the case and provided with an independent steam-chamber, of a shaft disposed vertically in and centrally through the case and footed in the shaft-bearing member said shaft having a short axial steam-chamber provided with a port registering with the steam-chamber in the shaft-bearing member and with hollow radially-disposed arms in the chamber of the large case said arms leading from the axial steam-chamber in the shaft and being provided at their extremities with orifices discharging tangentially into said case-chamber.



2. The combination with a hollow revolvible shaft having an in-

duction and an eduction port at a distance apart longitudinally of the shaft, of a hollow piston-valve extending past said induction and eduction ports, and having ports conformable with said induction and eduction ports in the shaft, said valve being movable endwise in the shaft, a valve-stem extending along in the shaft, gravity-weights on swinging levers pivoted on the shaft, the inner ends of which levers act on a collar on the stem, and a spring adapted to lift the stem and valve but to be overcome by the action of the governor or gravity-weights under centrifugal motion.

3. The combination with a steam-holding carriage-case having an eduction-port, of a shaft-bearing member at the bottom of the case and provided with a steam-chamber having an induction-port, a hollow carriage-shaft closed at its ends journaled in the case and having a steam-port registering with said chamber, hollow radial arms in the case on the shaft and leading therefrom and discharging tangentially into the steam-holding case, a chambered sliding valve in the shaft having ports registering normally with its induction and eduction ports, a valve-stem, a spring lifting the stem and the valve, and weighted levers pivoted on the shaft and disposed to depress the stem and valve when raised by centrifugal action.

603,661. GAS-BURNER. WILLIAM W. SEELEY, Brooklyn, N. Y. Filed July 20, 1897. Serial No. 646,407. (No model.)

Claim.—1. The combination with a base adapted to support a chimney and provided with a vertical tube having an air-opening, of a tubular slide carrying a burner and movable longitudinally upon the tube and a second slide adapted to control the air-opening, substantially as described.

2. The combination with a base supporting a chimney, of a burner normally surrounded by the chimney, said burner and base being relatively movable to bring the burner without the chimney and an igniter arranged to light the burner when it is brought without the chimney, substantially as described.

3. The combination with a base supporting a chimney and provided with a vertical tube, of a tubular slide carrying a burner and movable longitudinally upon the tube, said slide constituting an electrode, and a second electrode supported upon the frame in position to make contact with the first electrode during the movement thereof upon the vertical tube, substantially as described.

4. The combination with a base supporting a mantle and a chimney surrounding the mantle, of a burner normally projecting within the mantle, said burner and base being relatively movable to bring the burner without the mantle and an igniter arranged to light the burner when it is brought without the mantle, substantially as described.

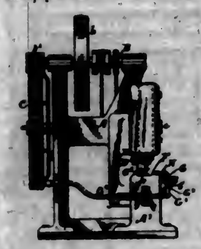
5. The combination with a base adapted to support a chimney and provided with a vertical tube, of a tubular slide carrying a burner and movable longitudinally upon the tube, a cock and a by-pass valve controlling the passage through the vertical tube, an operating-arm for the valve, and connections intermediate said arm and the tubular slide for lowering said slide simultaneously with the closing of the valve, substantially as described.

603,662. PIPE OR TUBE CUTTER. CHARLES H. SHERRICK, Reisterstown, Md., assignor of one-half to John F. Kuehn, same place. Filed June 28, 1897. Serial No. 641,982. (No model.)

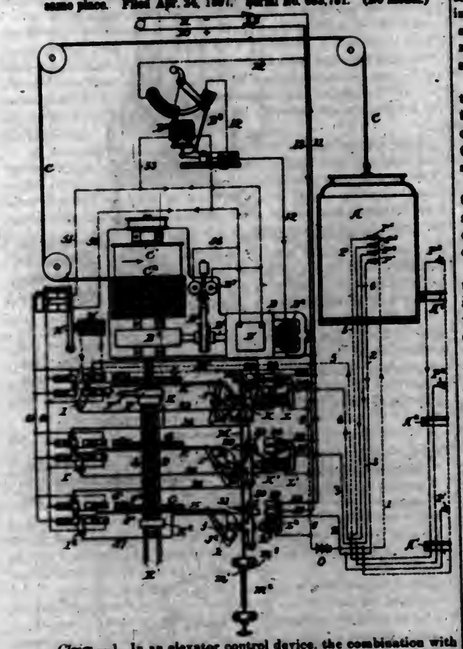
Claim.—1. A pipe-cutter comprising a rigid jaw having cutting-disks mounted therein, a movable jaw carrying a cutting-disk, said rigid jaw having a transversely-extending dovetailed slot formed therein at a point between the cutting-disks, and a bur-cutter consisting of a block beveled to form a central cutting-point, said cutter being removably secured in the dovetailed slot, substantially as set forth.

2. A pipe-cutter comprising the handle portion having the screw-threaded upper end, a rigid jaw curved at its upper part substantially as described, a semicircular slot within said upper curved portion, the disks mounted therein, a dovetail groove arranged on the space between said disks, a bur-cutter adapted to be fitted within said groove provided with the beveled sides, and the central point or trimmer, a sliding jaw carrying the cutting-disk, said sliding jaw being adapted to be freely slidable back and forth within a longitudinal slot formed on one side of the rigid jaw, as and for the purpose set forth.

603,663. BOOK-HOLDER. MARY H. SPIELMAN, Alma, Kans. Filed July 3, 1897. Serial No. 643,498. (No model.)



Claim.—A book-holder comprising two clasps each having a pair of parallel, elastic arms provided with oppositely-bent, interned, angular shank-arms adjustable one on the other, means for holding said shanks with the parallel clamping-arms set at the desired adjustment, and a flexible non-elastic connection between the two clasps for permitting them to engage, one the parts of one side and the other the parts of the other side of an open book for holding said parts, substantially as described.



603,664. PUNCHING-MACHINE. JOHN J. SULLIVAN, Troy, N. Y. Filed Feb. 10, 1898. Serial No. 669,851. (No model.)

Claim.—In combination with the frame of a punching-machine, its punches, and the dies thereof having a shoulder c^3, a guide-plate secured to said frame, clamp-plates F passing under said guide-plate,

arms G having their upper ends pivoted to said clamp-plates and their lower ends pivoted to the rocking shaft G^2, the arms-connecting bar, the branched arm S rigidly secured to the rocking shaft, a bolt adjustably uniting the arms connection with the arm S, and adjusting-screws passing through the branching arms and bearing against the arms G of the clamp-plates substantially as described.

603,665. CONTROL APPARATUS FOR ELEVATORS. ADOLF SUBRY, New York, N. Y., assignor to the Otis Brothers & Company, same place. Filed Apr. 24, 1897. Serial No. 633,781. (No model.)

Claim.—1. In an elevator control device, the combination with the motor and working circuit therefor, of local circuits operated from the car or floor, and a non-interfering locking device operated by a local circuit and released by the motor, substantially as described.

2. In an elevator control device, the combination with the motor and working circuit therefor, of local circuits operated from the car or floor, relays in said circuits, and a non-interfering device operated by a relay in a local circuit and released by the motor, substantially as described.

3. In an elevator control device, the combination with a motor and working circuits therefor, of local circuits including relays, a non-interfering locking device operated by the armatures of the relays, and pull-off devices for the locking devices operated by the motor, substantially as described.

4. In an elevator control device, the combination with a motor and working circuits, of local circuits including relays, a non-interfering locking device, pull-offs, and reversing devices, the pull-offs and reversing devices being operated by the motor, substantially as described.

5. In an elevator control device, the combination with the motor and working circuits therefor, of reversing devices for the motor, and a non-interfering locking device, the latter being released and the reversing devices being set by the motor, substantially as described.

6. In an elevator control device, the combination with the motor, of reversing devices, non-interfering locking devices, relays and local circuits operated from the car or floor, a stop or cut-out, and connections for operating it from the car, substantially as described.

7. In an elevator control device, the combination with the motor, of a direct armature-circuit therefor, a reversing field-magnet circuit therefor, reversing-levers controlling said circuit, and mechanism for operating said reversing-levers connected with the motor, substantially as described.

8. In an elevator control device, the combination with the motor, reversing devices, and non-interfering locking devices, of a traveling device connected to be operated by the motor and arranged to operate the reversing devices and locking devices in succession, substantially as described.

9. In an elevator control device, the combination with the motor, reversing devices, and non-interfering locking devices, of a traveling device connected to be operated by the motor, and connections between the respective reversing devices and locking devices whereby they are operated together to set the parts in position to permit the elevator moving up or down from any prior position, substantially as described.

10. In an elevator control device, the combination with the motor and main circuit for operating the motor, of non-interfering locking devices, relays, and local circuits connected with the relays and arranged so that when the relay is operated by the local circuit the main circuit is completed through the relay, substantially as described.

11. In an elevator control device, the combination with the motor and main circuit therefor, of relays and local circuits therefor the armatures of the relays being connected to the main circuit for closing the same, and non-interfering locking devices connected with the armatures to prevent the operation of more than one at a time, substantially as described.

12. In an elevator control device, the combination with the motor and main circuit therefor, relays and local circuits therefor, of armatures for the relays arranged to close the main circuit, and pull-off devices connected with the armatures for breaking the main circuit, substantially as described.

13. In an elevator control device, the combination with the motor and main circuit therefor, relays and local circuits therefor, of armatures for closing the main circuit, non-interfering locking devices for the armatures, and pull-off devices for breaking the main circuit, substantially as described.

14. In an elevator control device, the combination with the motor and main circuit therefor, relays and local circuits therefor, of armatures for the relays for closing the main circuit, pull-off devices for breaking the main circuit, reversing-switches connected with the pull-off devices, and means for operating the same from the motor, substantially as described.

15. In an elevator control device, the combination with the motor and main circuit therefor, relays and local circuits therefor, of means for closing the main circuit, non-interfering locking devices therefor, pull-off devices, reversing-switches, and means for operating the same connected with the motor, substantially as described.

16. In an elevator control device, the combination with the motor and main circuit therefor and relays and local circuits therefor, of means controlled by the relays for closing the main circuit, and a non-interfering locking device consisting of a band and stops therefor, substantially as described.

17. In an elevator control device, the combination with the main-circuit-closing devices, of a flexible band and stops therefor, and stops on the circuit-closing devices arranged so that when one of said circuit-closing devices is operated none of the others can be operated, substantially as described.

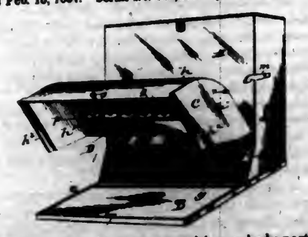
18. In an elevator control device, the combination with the main-circuit-closing devices, of a flexible band and stop devices therefor arranged to permit the operation of but one of the circuit-closing devices at a time, and pull-off devices arranged to operate the circuit-closing devices, substantially as described.

19. In an elevator control device, the combination with the motor and circuits therefor, of reversing-levers, a screw connected to be operated by the motor, a traveling nut on the screw, and connections whereby the nut operates the reversing-levers, substantially as described.

20. In an elevator control device, the combination with the motor and circuits therefor, of reversing-levers, a screw operated by the motor, a traveling nut on the screw, shifting rods, and connections between the nut and shifting rods whereby the reversing-levers are operated, substantially as described.

21. In an elevator control device, the combination with the motor and main circuit therefor, of relays and local circuits therefor,

armatures connected to close the main circuit, non-interfering locking devices connected with the armatures, pull-offs for operating the armatures to break the circuit, circuit-reversing levers, a screw operated by the motor, a nut traveling on the screw, and connections between the screw and reversing-levers and pull-offs, substantially as described.



603,666. COMPOSITION FOR MAKING MATCHES. ADOLPHE TACHAUER, Marseilles, and LOUIS BRALY, Lyons, France. Filed Dec. 14, 1897. Serial No. 661,849. (No specimens.) Patented in France Mar. 30, 1897, No. 265,487.

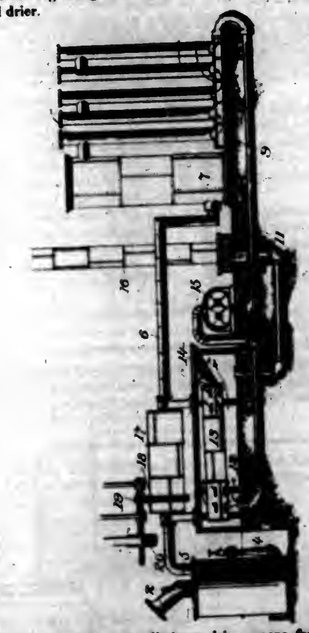
Claim.—1. A composition for manufacture of matches, consisting of an adhesive substance and a mixture in suitable proportions of the plumbates of calcium and strontium, metallic aluminium, and monosulfid of calcium, substantially as and for the purposes described.

2. A composition for manufacture of matches, consisting of a liquid adhesive substance and a powdered mixture of hyposulfite of lead, plumbates of calcium and strontium, metallic aluminium, sodium chlorid and monosulfid of calcium, in suitable proportions, substantially as and for the purposes described.

3. A composition for manufacture of matches, consisting of an adhesive substance, a powdered mixture of glass, hyposulfite of lead, plumbates of calcium and strontium, sodium chlorid, metallic aluminium, monosulfid of calcium, in suitable proportions, and potassium chlorate at defined temperature and proportion, substantially as and for the purposes described.

603,667. KITCHEN-CABINET. JAMES R. TATE, Cincinnati, Ohio. Filed Feb. 13, 1897. Serial No. 623,279. (No model.)

Claim.—A kitchen-cabinet comprising a body portion having vertical bins therein with outlet-openings at their lower ends, arms projecting forwardly from the ends of said body portion below said outlet-openings, a board supported between said arms, a cover hinged to the body portion and cooperating with said board to close the outlet-openings of the bins, a trough for the reception of canisters and secured within said cover so as to be disposed horizontally when the cover is closed and so as to be disposed in an upright position when the cover is raised to expose the outlets of the bins.

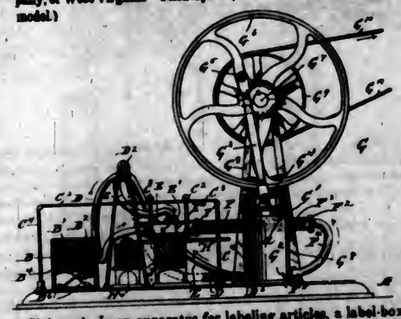


603,668. PROCESS OF AND APPARATUS FOR RECOVERING AMMONIA AND WASTE PRODUCTS FROM GARBAGE. JOSEPH B. TAYLOR and HENRY V. WALKER, Brooklyn, N. Y. Filed Aug. 23, 1897. Serial No. 649,278. (No model.)

Claim.—1. The method of garbage or refuse disposal which consists in dividing the garbage or refuse into sections for successive treatment, drying one section and burning the same in a thick layer in the presence of a supply of air, leading off the resulting products, burning the combustible portion of said products in the presence of the next successive section, for drying the same, and repeating this cycle with further sections in succession.

2. The method of garbage or refuse disposal which consists in dividing the garbage or refuse into sections for successive treatment, drying one section and burning the same in a thick layer, leading off the resulting products, dividing the ammonia from the combustible gases in said products, burning said combustible gases after separation of ammonia in the presence of the next successive section, for drying the same, and repeating this cycle with further sections successively.

3. The method of garbage or refuse disposal which consists in dividing the garbage or refuse into sections for successive treatment, drying one section and burning the same in a thick layer, leading off the resulting products over another section of the garbage for preliminary drying, dividing the ammonia and moisture from the combustible gases in said products, burning said combustible gases in the presence of another section of the garbage or refuse, for final drying and repeating this cycle with further sections successively.



4. A gas-producer, a preliminary drier, means for leading the gas from the producer to said preliminary drier, a condenser for separating the ammonia and moisture from said gas, a final drier, and means for burning said gas after passage through said condenser near said final drier.

5. A gas-producer, a preliminary drier, means for leading the gas from the producer through said drier, means for agitating the contents of said drier, a condenser for separating ammonia and moisture from said gas, a final drier and means for burning said gas after passing through said condenser near said final drier.

6. A gas-producer, a preliminary drier, means for rotating the latter, cooling-chambers for separation of ammonia, a final drier and furnace around the same; in combination with pipes leading from said producer through said preliminary drier and ammonia-separator to said final drying-furnace, and a suction device for drawing the gases through a portion of their total path.

603,669. PNEUMATIC LABELING-MACHINE. CHARLES F. TEBBETS, Boston, Mass., assignor to the Tebbetts Labeling Machine Company, of West Virginia. Filed Apr. 22, 1897. Serial No. 633,897. (No model.)

Claim.—1. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for moving the label-carrier from the label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the label as the under side of said label passes over and in contact with said device on the travel of said label from the label-box to the article to be labeled, and means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

2. In an apparatus for labeling articles, a label-box for holding

the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to move the label-carrier from the label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label in its travel from the label-box to the article to be labeled, and means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

3. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to move the label-carrier from the label-box to the article to be labeled, a device located in the line of travel of said label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled; and means for returning the label-carrier to the label-box

4. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, and means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

5. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from a label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled, and means for returning the label-carrier to the label-box.

6. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from said label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

7. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, a device located in the line of travel of said label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, and means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

8. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move said label-carrier with the label to the article to be labeled, a device located in the line of travel of said label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

9. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, a brush located in a box in the line of travel of said label-carrier and containing adhesive material and adapted to be rotated by the movement of the label-carrier to apply adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

10. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled and provided with a bottom plate having a group of perforations corresponding in shape to the label to be transferred, means for producing a vacuum in the label-carrier to lift a label from said label-box and to hold it over said perforations during its travel to the article to be labeled, means for moving said label-carrier from said label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the label as the under side of said label passes over and in contact with said device on the travel of said label from the label-box to the article to be labeled, means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled, and means for returning said label-carrier to said label-box.

11. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled and having a perforated bottom, means for producing a vacuum to lift a label from said label-box and to hold it over said perforations and to move the label-carrier with the label to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

12. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled and having a perforated bottom, means for producing a vacuum to lift a label from said label-box and to hold it over said perforations and to move the label-carrier with the label to the article to be labeled, a device located in the line of travel of said label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

13. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled and provided with a removable bottom plate having a group of perforations corresponding in shape to the label to be transferred, means for producing a vacuum to lift a label from said label-box and to hold it over said perforations and to move said label-carrier with the label to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

14. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, a support for the carrier in its travel, and an air-pump adapted to produce, during its forward stroke, a vacuum to lift a label from said label-box to the label-carrier and to move said label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

15. In an apparatus for labeling articles, a label-box for holding the labels, a receptacle for holding the articles to be labeled, a label-carrier for transferring a label from the label-box to the article to be labeled in said receptacle, a support for the carrier in its travel, and an air-pump adapted to produce, during its forward stroke a vacuum to lift a label from said label-box to the label-carrier and to move said label-carrier with the label from the label-box to the article to be labeled in said receptacle, and adapted during its return stroke to produce an air-pressure upon its arrival over the article to be labeled in said receptacle to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box

16. In an apparatus for labeling articles, a label-box for holding the labels having an opening smaller than the size of the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box through said opening to the label-carrier and to move the label-carrier with the label to the article to be labeled, and means for producing an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

17. In an apparatus for labeling articles, a label-box for holding the labels having an opening smaller than the size of the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box through said opening to the label-carrier and to move the label-carrier with the label to the article to be labeled, and means for producing an air-pressure to apply the transferred label to the article to be labeled and to return the label-carrier to the label-box.

18. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, and an air-pump having its piston-rod connected directly to a driving-wheel and adapted to produce during its forward stroke a vacuum to lift a label from said label-box to the label-carrier and to move said label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

19. In an apparatus for labeling articles, a label-box for holding the labels, a hollow label-carrier for transferring a label from the label-box to the article to be labeled, a support for the carrier in its travel, an air-pump, a conduit connecting said label-carrier with said pump, a piston-chamber, a piston adapted to reciprocate in said chamber and having its piston-rod connected to the label-carrier, a conduit connecting said piston chamber with said air-pump, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, said air-pump being adapted during its forward stroke to produce a vacuum in the label-carrier

to lift a label from the label-box to the label-carrier and to produce a vacuum in said piston-chamber to move the label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the label-carrier to apply the transferred label to the article to be labeled and to produce an air-pressure in said piston-chamber to return said label-carrier to said label-box.

20. In an apparatus for labeling articles, a label-box for holding the labels, a hollow label-carrier for transferring a label from the label-box to the article to be labeled, a support for the carrier in its travel, an air-pump having its piston-rod connected to a driving-wheel, a conduit connecting said label carrier with said pump, a piston-chamber, a piston adapted to reciprocate in said chamber and having its piston-rod connected to the label-carrier, a conduit connecting said piston-chamber with said air-pump, means for moving the labels in the label-box upwardly toward the top of said box, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, said air-pump being adapted during its forward stroke to produce a vacuum in the label-carrier to lift a label from the label-box to the label-carrier and to produce a vacuum in said piston-chamber to move the label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the label-carrier to apply the transferred label to the article to be labeled and to produce an air-pressure in said piston-chamber to return said label-carrier to said label-box.

21. In an apparatus for labeling articles, a label-box for holding the labels, a hollow label-carrier for transferring a label from the label-box to the article to be labeled, a support for the carrier in its travel, an air-pump having its piston-rod connected directly to a driving-wheel, a conduit connecting said label-carrier with said pump, a piston-chamber, a piston adapted to reciprocate in said chamber and having its piston-rod connected to the label-carrier, a conduit connecting said piston-chamber with said air-pump, means for moving the labels in the label-box upwardly toward the top of said label-box, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, said air-pump being adapted during its forward stroke to produce a vacuum in the label-carrier to lift a label from the label-box to the label-carrier and to produce a vacuum in said piston-chamber to move the label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the label-carrier to apply the transferred label to the article to be labeled and to produce an air-pressure in said piston-chamber to return said label-carrier to said label-box.

22. In an apparatus for labeling articles, a label-box for holding the labels, a hollow label-carrier for transferring a label from the label-box to the article to be labeled and having a perforated bottom, a support for the carrier in its travel, an air-pump having its piston-rod connected directly to a driving-wheel, a conduit connecting said label-carrier with said pump, a piston-chamber, a piston adapted to reciprocate in said chamber and having its piston-rod connected to the label-carrier, a conduit connecting said piston-chamber with said air-pump, means for moving the labels in the label-box upwardly toward the top of said box, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, said air-pump being adapted during its forward stroke to produce a vacuum in the label-carrier to lift a label from the label-box to the label-carrier and to hold it over said perforations and to produce a vacuum in said piston-chamber to move the label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the label-carrier to apply the transferred label to the article to be labeled and to produce an air-pressure in said pistou-chamber to return said label-carrier to said label-box.

23. In an apparatus for labeling articles, a label-box for holding the labels having an opening smaller than the size of the labels, a hollow label-carrier for transferring a label from the label-box to the article to be labeled and having a perforated bottom, a support for the label-carrier in its travel, an air-pump having a piston-rod connected directly to a driving-wheel, a conduit connecting said label-carrier with said pump, a piston-chamber, a piston adapted to reciprocate in said chamber and having its piston-rod connected to the label-carrier, a conduit connecting said piston-chamber with said air-pump, means for moving the labels in the label-box upwardly toward the top of said box, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, said air-pump being adapted during its forward stroke to produce a vacuum in the label-carrier to lift a label from the label-box to the label-carrier through said opening and to hold it over said perforations and to produce a vacuum in said piston-chamber to move the label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the label-carrier to apply the transferred label to the article to be labeled and to produce an air-pressure in said piston chamber and to return said label-carrier to said label-box.

24. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the label as the under side of said label passes over and in contact with said device in the travel of said label from the label-box to the article to be labeled, a power-shaft, a driving-wheel fast on said power-shaft, and an air-pump having its piston-rod connected directly to said driving-wheel and adapted during its forward stroke to produce a vacuum in said label-carrier to lift a label to said label-carrier and to hold it thereon, and adapted during its return stroke to produce an air-pressure in said label-carrier to apply the transferred label to the article to be labeled.

25. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, a device located in the line of travel of to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, a power-shaft, a driving-wheel fast on said power-shaft, and an air-pump having its piston-rod connected directly to said driving-wheel and adapted during its forward stroke to produce a vacuum in said label-carrier to lift a label to said label-carrier and to hold it thereon and to move said label-carrier with the label to the article to be labeled and adapted during its return stroke to produce an air-pressure in the said label-carrier to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

26. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, a support for the carrier in its travel, a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, and an air-pump adapted during its forward stroke to produce a vacuum in said label-carrier to lift a label to said label-carrier and to hold it thereon and to move said label-carrier with the label to the article to be labeled, and adapted during its return stroke to produce an air-pressure in the said label carrier to apply the transferred label to the article to be labeled and to return said label-carrier to said label-box.

27. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, and means for applying the transferred label to the article to be labeled.

28. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum to lift a label from the label-box to the label-carrier and to move the label-carrier with the label to the article to be labeled, means for applying the transferred label to the article to be labeled, and a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled.

29. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for lifting a label from the label-box and for holding it on the label-carrier, means for moving the label-carrier from the label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the label as the under side of said label passes over and in contact with said device on the travel of said label from the label-box to the article to be labeled, and means for applying the transferred label to the article to be labeled.

30. In an apparatus for labeling articles, a label-box for holding the labels, a label-carrier for transferring a label from the label-box to the article to be labeled, means for producing a vacuum in the label-carrier to lift a label from the label-box and to hold it on the label-carrier during its travel to the article to be labeled, means for moving the label-carrier from the label-box to the article to be labeled, a device located in the line of travel of the label-carrier for applying adhesive material to the under side of the label on its travel from the label-box to the article to be labeled, means for producing an air-pressure in the label-carrier to apply the transferred label to the article to be labeled, and means for returning the label-carrier to the label-box.

603,670. NUT-LOCK. JOHN F. TITUS, Boone County, Ind. Filed Apr. 9, 1896. Serial No. 586,516. (No model.)

Claim.—The combination with a bolt having a slit extended across its end, of a nut having a plurality of notches on its outer face and a recess or cavity, and a spring having a plurality of coils adapted to be received in said cavity, one end of the spring being turned across the center of said coils and adapted to be received in the slit in the end of the bolt, and the other end of said spring extended outwardly and at an angle to the first-mentioned end and adapted to engage the notches of the nut, all substantially as herein shown and described.

603,671. HANDLE-BAR. THOMAS VANTUYL, Hinhole, Iowa. Filed Sept. 2, 1896. Serial No. 604,603. (No model.)

Claim.—1. A handle-bar provided with a transversely-extending fitting formed at its ends with longitudinal bearings, handle-arms engaging with their inner ends the said bearings and a handle-bar stem having a head in which the said fitting is mounted to be turned and secured after adjustment, and a key held in the said fitting and adapted to lock the latter to the head and the handle-arm ends to the said bearings, substantially as described.

2. A handle-bar, comprising a handle-bar stem formed with a head having internal notches, a fitting mounted to turn in the said head, and formed at its ends with bearings, handle-arms engaging with their inner, longitudinal ends the said bearings, and a key held in the said fitting and engaging notches in the handle-arm ends and notches in the said head, substantially as shown and described.

3. A handle-bar, comprising a handle-bar stem formed with a head having internal notches, a fitting mounted to turn in the said head and formed at its ends with bearings, handle-arms engaging with their inner, longitudinal ends the said bearings, a key held in the said fitting and engaging notches in the handle-arm ends and notches in the said head, and a clamping-screw for the split end of the said head, substantially as shown and described.

603,672. TROLLEY DEVICE FOR ELECTRIC-RAILWAY CARS. LOUIS R. WALKER, Springfield, Mass., assignor of one-half to Francis W. Dickinson, same place. Filed Apr. 14, 1897. Serial No. 632,116. (No model.)

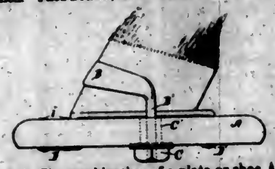
Claim.—1. The combination with an overhead support or conduit having upper and lower ways or conductors, of a trolley having a wheeled body running on the lower conductor or way and having a spring-supported shoe to run with an upwardly-bearing pressure on and along the upper conductor, the car having the upright arms g g^3, one in advance of the other, each pivotally connected on the car for a fore-and-aft vibration, and each having adjacent its pivot an angular arm g^4, cushions above and below said arms g^4 and the connections m between the arms g g^3 and the ends of the trolley-body, substantially as described.

2. The combination with the body of the trolley having the journals for the trolley wheels or trucks which are mounted thereon and having at its sides the upper and lower laterally-extending apertured flanges 13, 14, the shoe d having the stems 16 playing through said flanges and each provided with a shoulder and the springs encircling the stems and exerting an upward pressure against said shoulders, substantially as described.

3. The combination with a motor-car, of an overhead inverted conduit A composed of insulated material, provided at its under central portion with the longitudinal slot, provided therewithin, adjacent the opposite margins of said slot, with the upstanding conductor-tracks b b, and provided at its central upper wall with the longitudinal depending conductor, a, the trolley or carriage having wheels running on, and in electrical connection with, said track conductors, b b, and carrying at its top the spring-supported shoe, d, insulated from the wheels of the trolley, and in bearing contact with an upward pressure on said upper central conductor, a, the arms, g g^3, upwardly extended above the car and entering through said conduit-slot into the conduit in advance and to the rear of said trolley, and horizontal connections, m m, between said arms and the front and rear ends of the trolley-carriage, substantially as described.

603,673. STRAINER FOR MILK-PAILS. FRANK ASHLEY, Medical Lake, Wash. Filed July 19, 1897. Serial No. 645,094. (No model.)

Claim.—A removable tray and strainer for milk-pails, comprising in combination with the tray proper, having a screen located in the bottom thereof and a guard about the same, a supplemental cooling-tray E, having a centrally imperforated portion, the screen-openings E about the outer margin of said tray E, which tray is pivoted to the under side of the tray proper, the eye E' pivoted to the free swinging edge of the said tray E, and the pin A' for engagement with said eye, whereby the bottoms of the trays may be held parallel to each other with a slight space intervening between same, substantially as and for the purpose set forth.

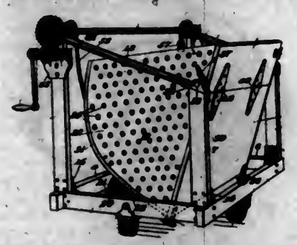


603,674. FASTENER FOR BAGS. ALFRED ARKELL, Headingly, Canada. Filed Apr. 5, 1897. Serial No. 630,771. (No model.) Patented in Canada Dec. 4, 1896, No. 54,374.

Claim.—The herein-described bag-fastener consisting essentially of the lever B, bifurcated and provided with hooks f, at one end and having the slot h, at an intermediate point of its length, the strap C,

permanently connected to the lever B, the hook A, interposed between and pivotally and permanently connected with the hooks *f*, of the lever B, and having a shank and also having the staple *i*, on said shank adapted to take through the slot *h*, of the lever, and the strap *h*, permanently connected to the shank of the hook and terminating in the eye or loop *e*, adapted to receive the hook end of the lever B, and the hook A, all as and for the purpose specified.

608,675. MARSH-HORSESHOE. WILLIAM H. BORDNER, Burt Oak, Mich. Filed Dec. 21, 1897. Serial No. 662,908. (No model.)



Claim.—1. The combination of a plate or shoe A, with suitable depressions to receive the calks of the horseshoe; a clamp B bent forward to conform to the hoof of an animal and having vertical end portions B' projecting through the shoe or plate A; and screw-threaded nuts C, shouldered and having a shank portion C' fitted in suitable holes in the plate to engage the vertical portion of the clamp, for the purpose specified.

2. The combination of a plate or shoe A, a clamp B bent forward to conform to the hoof of an animal and having vertical end portions B' projecting through the shoe or plate A; and screw-threaded nuts C, shouldered and having a shank portion C' fitted in suitable holes in the plate to engage the vertical portion of the clamp for the purpose specified.

3. The combination of a plate or shoe A; a clamp conformed to the hoof of an animal having vertical end portions projecting through said shoe; screw-threaded nuts C, shouldered and having shanks C' in holes in the plate, and means of preventing a hoof from slipping on the shoe, as specified.

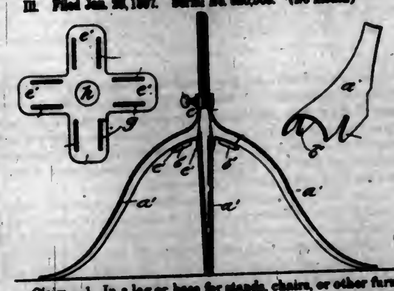
608,676. STOCK-TRUCK. GEORGE P. CLARK, Windsor Locks, Conn. Filed July 20, 1897. Serial No. 645,200. (No model.)

Claim.—1. A stock-truck consisting of a frame and a body supported for tilting movement by the frame and having a reticulated side or sides.

2. A stock-truck consisting of a frame; a body supported for tilting movement by the frame and having a reticulated side or sides; and manually-operated means connected with the body for tilting the same.

3. A stock-truck consisting of a frame; a body supported for tilting movement by the frame and having a reticulated side or sides; a shaft having a sprocket-wheel; a sprocket-chain passed around the sprocket-wheel and connected with the body; and means for rotating said shaft.

4. A stock-truck consisting of a frame; a body supported for tilting movement by the frame; a shaft mounted in the frame and having sprocket-wheels; sprocket-chains passed around the sprocket-wheels and connected at one end with the body; weights secured to the free ends of the chains; a shaft having a crank-arm; and gearing between said shafts.



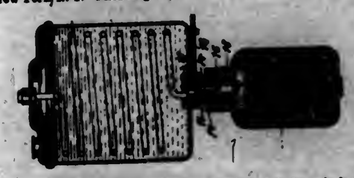
5. A stock-truck consisting of a frame composed of a base portion and a series of vertical posts rising therefrom; tie-bars secured to the posts and having bearings at one end; a body having reticulated sides provided with projecting journals working in bearings in the tie-bars; a shaft rotatively carried by the frame and having a sprocket-wheel; a sprocket-chain passing around the sprocket-wheel and secured at one end to the body; a worm-gearing one member of which is connected with said shaft, the work-shaft being provided with a crank-arm.

6. A stock-truck consisting of a frame; a tilting body having projecting trunnions working in bearings on the frame, the front side of the body having a tilting flap and the opposite side of said body being reticulated; a shaft mounted on the frame, having a sprocket-wheel; a sprocket-chain passed around the sprocket-wheel and secured at one end to the body; and means for rotating said shaft.

7. A stock-truck consisting of a frame; a tilting body having projecting journals working in bearings on the frame, the front wall of the body consisting of two sections, one hinged to the other, and the side walls of the body being reticulated; a shaft supported by the frame, having a sprocket-wheel; a sprocket-chain passed around the sprocket-wheel, one end being secured to a projection on the body; a weight secured to the opposite or free end of the sprocket-chain; worm-gearing one member of which is secured to said shaft; a bracket on the frame, for supporting the worm-shaft; and a crank-arm fixed to said worm-shaft.

8. A frame consisting of a plurality of members having squared ends abutting against each other, and a bracket having a substantially L-shaped main portion secured to two of the members of the frame, said main portion having a flange secured to the other member of the frame, the flange in turn being provided with a second flange also secured to said last-mentioned member.

608,677. STAND OR CHAIR BASE. JAMES W. COULTAS, Chicago, Ill. Filed Jan. 28, 1897. Serial No. 620,968. (No model.)



Claim.—1. In a leg or base for stands, chairs, or other furniture, a sheet-metal blank for the leg, having spurs at the edges of the blank, a foot portion of the blank on one side of the spurs, and a stem portion of the blank on the opposite side of the spurs from said foot portion, substantially as described and shown.

2. In a leg or base for stands, chairs, or other furniture, a sheet-metal blank for the leg, said blank having a foot portion at one end of the blank, and a stem portion at the other end of the blank, and a fulcrum-hold between said stem portions and foot portions, substantially as described and shown.

3. In a base for stands, chairs, and other furniture, the combination of a central standard or tree, a locking-plate attached to or surrounding the standard and provided with slits corresponding to the attaching-points on the legs and having the incline of the legs, and a plurality of legs each provided on each side with a downwardly-projecting spur portion, said spur portion being located between the foot and stem portions of the legs and being adapted to engage with or hook into and draw upon the locking-plate to lock the parts firmly together, substantially as described and shown.

4. The combination of the sheet-metal leg *a*, having its inclined lower edge spurred on both sides and a slitted locking-plate, *c*, inclined parallel with the said lower edge of the legs, substantially as described and shown.

608,678. ACETYLENE-GENERATOR. EDWARD H. DAMEREL, New York, N. Y. Filed Aug. 12, 1897. Serial No. 647,956. (No model.)

Claim.—1. The calcium-carbid cartridge, consisting of a laterally-extensible air-tight vessel provided with a pierceable air-tight film covering its opening, substantially as described.

2. The combination in an acetylene-gas generator, of a pierceable air-tight cartridge, having a screw-cock provided with a pierceable film, a water chamber connected therewith, and a screw connection between the water-chamber and said neck for making a gas connection, substantially as described.

3. The combination in an acetylene-gas generator of the water-chamber, the laterally-expansible carbid-receptacle, and means for detachably connecting the same, substantially as described.

4. The combination in a carbid cartridge, of a pierced water-tube located at an angle within said cartridge, substantially as described.

5. The combination of the laterally-expansible metallic cartridge 6, having screw connection 7, and pierced paper tube 19, substantially as described.

608,679. ROTARY ENGINE. DUDLEY DRAKE, Newark, N. J. Filed May 7, 1897. Serial No. 635,559. (No model.)

Claim.—1. A rotary engine having an eccentric piston, an abutment provided with a laterally-extending flange, and angular edges extending beyond the foot, grooves in the heads of the cylinders and packing-strips in said grooves, in combination with a wedge for adjusting the abutment.

2. A rotary engine having an eccentric piston provided with a diagonal peripheral packing and angular end packing-rings engaging said peripheral packing with their inclined surfaces, in combination with an abutment having a laterally-extending foot or flange supporting a packing to engage the piston, and means for adjusting the abutment.

3. A rotary engine having an eccentric piston, an abutment provided with a laterally-extending foot or flange and angular edges extending beyond said foot, in combination with grooves in the ends or heads of the cylinder and angular packing-strips in said grooves.

4. A rotary engine having an abutment provided with a laterally-extending foot or flange, a fixed central packing-piece and laterally-movable end packing-pieces supported in the extension of said foot.

608,680. VAPOR GENERATOR AND BURNER. JAMES G. W. HUTCHELS, FRED STARR, ORRIN P. TALLEY, and HENRY R. LORIANCE, Chicago, Ill. Filed Nov. 20, 1896. Serial No. 613,057. (No model.)

Claim.—1. In a vapor generator and burner, the combination with a centrally-apertured plate having an annular chamber substantially coextensive with its body, of a laterally-apertured shell secured to the lower side of the plate to form therewith a combustion-chamber, an induction-tube entering the chamber of the plate, and a burner-nipple leading from each plate-chamber, remote from the induction-pipe, to the combustion-chamber and being directed away from the aperture of the shell.

2. In a vapor generator and burner, the combination with a centrally-apertured plate having an annular chamber substantially coextensive with its body, of a laterally-apertured shell secured to the lower side of the plate to form therewith a combustion-chamber, an induction-tube entering the chamber of the plate, and a burner-nipple leading from each plate-chamber, remote from the induction-pipe, to the combustion-chamber, a rotatable sleeve fitted within the central aperture of the plate, and a finger attached to the sleeve and adapted to frictionally sweep the lower surface of the plate.

3. The combination with a vapor generator and burner, of a service-pipe having a swiveled joint, comprising a centrally-apertured cap having segmental slots and being attached to one section of the pipe, and a centrally-apertured disk fitted rotatably within the cap and fixed to the cooperating section of the pipe, a pair of headed pins passing through the segmental slots and fixed within the disk, and a nipple leading from the aperture of the disk through the cap and being of less capacity than the pipe-section to which the cap is attached.

608,681. THROW-OFF SWITCH FOR TELEPHONES. NATHAN FALLEK, San Francisco, Cal., assignor of thirty-one sixtieths to Frederick Hess, Jr., Albert K. Andriano, and Isidore Harris, same place. Filed Aug. 17, 1897. Serial No. 648,581. (No model.)

Claim.—The combination with the pivotally-attached switch-lever A; of the spring E, the ratchet-toothed bar F, the sliding dog G, spring-arm $g^{\times}$, pivoted lever H, pivoted piece I on the end of said lever and the arm on the telephone-hook having the inclines A^3 on the end to engage the inclines on the said piece I, constructed for operation as set forth.

608,682. ALDEHYDE-LAMP. BOUDET FOURNIER, Paris, France. Filed Apr. 10, 1897. Serial No. 631,561. (No model.) Patented in France Mar. 26, 1897, No. 266,297; in Belgium Mar. 25, 1897, No. 127,319; in England Mar. 26, 1897, No. 7,867; in Italy Mar. 27, 1897, 44/294; in Austria Apr. 30, 1897, No. 1,857, and in Spain May 3, 1897, No. 20,033.

Claim.—1. In an aldehyde-vapor lamp a disk of platinum wires adjustably mounted over the wick-tube by means of a bent rod as J provided with a rack K in a guide-support N and an adjusting-nut L substantially as described.

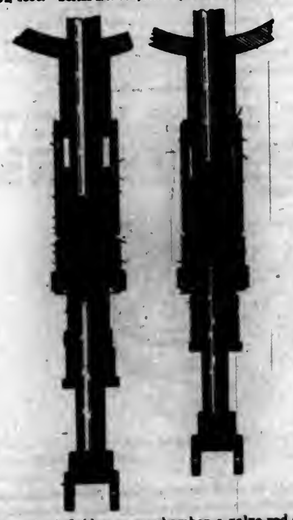
2. An aldehyde-vapor lamp consisting of a liquid-container as A and wick-tube E provided with an air-supply pipe as P in combination with a disk of platinum wires H adjustably supported in the vessel by means of a bent lever I rack K support N and nut L, and a cup Q and clip R, S, T, the whole being inclosed in a casing X provided with a cover Z substantially as described and illustrated in the accompanying drawings.

3. An aldehyde-vapor lamp consisting of a liquid-container as A and wick-tube E provided with an air-supply pipe as P in combination with a disk of platinum wires H adjustably supported on the vessel by means of a bent lever I rack K support N and nut L and a cup Q' containing absorbent material and provided with a cover Q^6 the cup being carried on a bent lever R' S^5 adjustably secured in a tube S^6 by a set-screw S^7 substantially as described and illustrated in the accompanying drawings.

4. An aldehyde-vapor lamp consisting in the combination with a liquid-container and burner-tube and wick, of a platinum disk adjustable in height, and a cup arranged above the said disk and adapted to be adjusted relatively to the latter.

5. An aldehyde-vapor lamp consisting in the combination with

a liquid-container and burner-tube and wick, of a platinum disk adjustable in height, and a cup arranged above the said disk and adapted to be adjusted horizontally relatively to the disk.



608,683. LOCK-NUT. HARRY F. GARDNER and FRANK J. BENSCOTER, Mackville, Kans. Filed Sept. 16, 1897. Serial No. 651,870. (No model.)

Claim.—1. An automatic lock-nut, comprising the nut proper, provided with a recess having a fulcrum-point, a lock seated in said recess upon said fulcrum-point, and having an extension that projects beyond the base of the nut and threads which form a continuation of the threads of the nut, whereby when the nut is screwed home, the lock will be rocked upon its fulcrum-point, thus clamping the threads of the bolt to which the nut is applied, substantially as set forth.

2. An automatic lock-nut, comprising the nut proper provided with a recess, the end wall of which is provided with a fulcrum-point intermediate the breadth of the recess, a lock seated in said recess and provided with an extension that normally projects beyond the base of the nut, and provided with threads that form a continuation of the threads of the nut, and with a recess at one side of the threads, a lip for permanently holding the lock in said recess, and a lip to be bent down over the lock when screwed up against a solid object, substantially as set forth.

608,684. THROTTLE. JOHN P. GRIGER, Orwigsburg, Pa. Filed Dec. 24, 1896. Serial No. 616,572. (No model.)

Claim.—1. A fluid-pressure chamber, a valve-rod extending into said chamber and a casing for the rod connected to the wall of the chamber and provided with a valve-chamber in combination with a valve within said valve-chamber and surrounding the valve-rod; and a packing-chamber surrounding the stem of said valve.

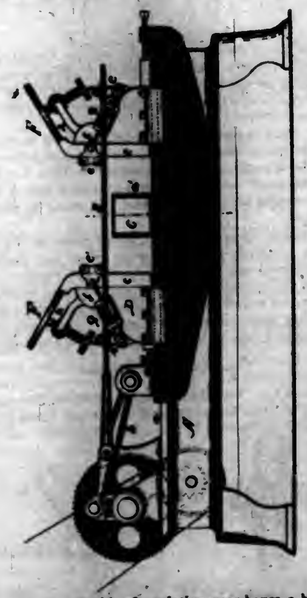
2. A valve-rod and an inclosing casing connected to the wall of a fluid-pressure chamber, in combination with means for locking the valve-rod and means within the casing for preventing fluid from said chamber entering the casing.

3. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber and provided with a valve-chamber having two seats, in combination with a valve having two faces and surrounding the valve-rod, and a packing-chamber surrounding the stem of said valve.

4. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber and provided with a valve-chamber, in combination with a valve surrounding the valve-rod and movably secured thereto.

5. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber and provided with a valve-chamber, in combination with a valve surrounding the valve-rod and longitudinally movable thereon.

6. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber and provided with a valve-chamber having valve-seats at both ends thereof, in combination with a valve surrounding the valve-rod and having a working face at each end.



7. A steam-dome, a valve-rod having a screw-thread thereon and an annular valve having a tubular stem engaging said screw-thread, in combination with an inclosing casing connected to the exterior of said dome.

8. A fluid-pressure chamber, a valve-rod, a casing for the rod outside of said chamber and an annular valve having a tubular stem and revolubly mounted on said rod to move longitudinally thereon, in combination with a valve-chamber; and a packing-chamber surrounding the tubular stem of said valve.

9. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber, in combination with a valve surrounding said valve-rod and having a rod-packing chamber at the end of its tubular stem and a packing-chamber for the stem of the valve.

10. A fluid-pressure chamber, a valve-rod and a casing for the rod outside of said chamber and provided with a valve-chamber having a valve-seat at each end thereof, in combination with a valve having a face at each end, surrounding the valve-rod, longitudinally movable thereon and constructed to lock the valve-rod in one of its positions.

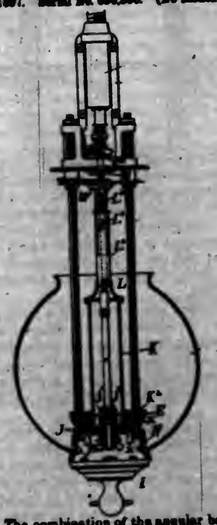
608,685. BOX-PRINTING MACHINE. JAMES F. GILLILAND, Adrian, Mich., assignor to the Adrian Box Company, same place. Filed Aug. 6, 1897. Serial No. 647,207. (No model.)

Claim.—1. In a machine for printing upon boxes, a base having a stationary mandrel mounted thereon, and a sliding table and means for reciprocating said table upon said base, printing-plates mounted upon said table, and adapted to be brought alternately into engagement with the sides of the box as set forth.

2. In a machine for printing upon boxes, a base having a stationary mandrel mounted thereon, a sliding table on said base and means for reciprocating said table, printing-plates mounted on said table and means for adjusting their position, so as to bring them into contact with the face of the box-body, as set forth.

3. In a machine for printing upon boxes, a base suitably mounted and having a stationary mandrel mounted thereon, a reciprocating table mounted on said base, and means for reciprocating the same, printing-plates mounted on said table, and means for automatically inking said plate with the movement of the table, substantially as described for the purposes set forth.

608,686. LUBRICATOR. EDWARD O. NOBS, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Dec. 13, 1897. Serial No. 661,635. (No model.)



Claim.—1. A lubricator, comprising an integral oil-cup, having one or more projecting ducts, a normally-closed valve, and an external screw-thread, said cup being adapted to be projected through an opening in the body to which it is applied, and a clamping-nut for securing the same in position, substantially as described.

2. A lubricator, comprising an integral valved oil-cup, having an external shoulder, and a projection of reduced diameter, externally screw-threaded and adapted to be projected through an opening in a body to which it is applied, so as to bring its shoulder into contact with the body adjacent to said opening, an externally-applied nut for clamping it in place, and one or more ducts for conveying the lubricant to the desired object or place, substantially as described.

3. A lubricator, for use in a hollow hub or similar object having a hole or opening to receive it, consisting of an oil-cup, having a duct or ducts leading therefrom, an internal, normally-closed valve, an external shoulder, and an externally-screw-threaded projection adapted to guide the operator in applying the lubricator to the hole or opening in the object to which it is applied, and a nut for application to such screw-threaded portion outside of the object to which the lubricator is applied, substantially as described.

608,687. ELECTRIC-ARC LAMP. JOHN H. J. HAINES, New York, N. Y., assignor to the Haines Electric Company, Jersey City, N. J. Filed May 27, 1897. Serial No. 639,208. (No model.)

Claim.—1. The combination of the annular base-plate, the outer globe supported thereon, the removable ring for sustaining the globe, the arc-inclosing chamber mounted directly upon said plate over the opening therein, and a removable plate closing said opening and carrying the lower-carbon holder.

2. The combination with the base-plate suspended directly from the upper framework of the lamp and having an opening through the center, of the lamp-globe supported upon said base, the arc-inclosing globe also supported upon said base-plate, the cap for the arc-inclosing globe secured to the upper framework of the lamp, the plate removably fitted to the opening in the base plate, the lower-carbon holder mounted thereon, and the upper-carbon carrier removable through the base-plate, substantially as and for the purpose set forth.

3. The combination with the carbon-carrying rod and the plate F, through which it passes, of the cap portion of the arc-inclosing chamber having at its upper end an enlargement which is secured to the under side of said plate and thereby forms the chamber M, an asbestos packing in said chamber about the rod, and plates on either side of the asbestos to insure its engagement with the rod.

4. In an arc-lamp, a dash-pot having a central tube concentric with the outer wall, and having a piston consisting of concentric tubes working in the space between said central tube and the outer wall, and a hollow piston-rod, as and for the purpose set forth.

5. The combination with the dash-pot and its piston, of the solenoids on either side thereof, the yoke connecting the cores of the solenoids and embracing the stem of the piston and spring-seated thereon, and the feeding-clutch operatively connected to said piston.

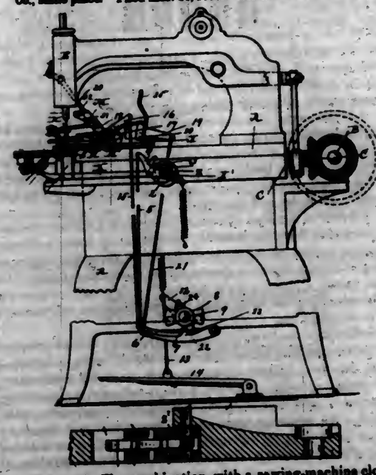
6. In an alternating-current arc-lamp, the combination with the feeding mechanism, of a cut-out cooperating therewith to stop the feeding and adapted to be thrown into operation by the tremor of the lamp, substantially as set forth.

7. The combination with the carbon-carrying rod, provided with a nick or projection, of an inclined plate mounted to slide into engagement with said nick or projection to stop the feeding of the rod.

8. The combination with the tilting clutch and the nicked rod, of a plate carried on said clutch, and adapted to slide into said nick.

9. The combination with the tilting clutch, of a plate mounted movably thereon, and the nicked rod having a rounded shoulder below said nick for the purpose set forth.

10. The combination with the carbon-carrying rod and its feeding-clutch, of a supplemental clutch or brake wholly independent of the feeding-clutch and consisting of a perforated plate embracing the carbon-carrying rod but out of engagement therewith during feeding and adapted to be tilted to bite the rod and hold the same up during trimming.



11. The combination with the carbon-carrying rod, of the perforated tilting plate or brake embracing the same but out of engagement therewith during feeding, and means for holding the said plate in a tilted position to clutch the rod and retain it against movement during trimming.

12. A thermostatic clamp, consisting of a split tube surrounded by a bimetallic ring.

13. The combination with the carbon-carrying rod, of a socket upon its lower end, a split tube located therein, and a thermostatic device for decreasing the diameter of said tube.

14. In an arc-lamp, the combination with the carbon, of a thermostatic clamp embracing a bimetallic ring, as and for the purpose described.

608,688. THREAD-TRIMMING DEVICE FOR SEWING-MACHINES. HERBERT R. HAWES, Brooklyn, N. Y., assignor to Colby & Co., same place. Filed Mar. 16, 1897. Serial No. 627,746. (No model.)

Claim.—1. The combination, with a sewing-machine cloth-plate, of a winged thread-cutting piece mounted to revolve therein unidirectionally across the needle-hole, so as to cut the under thread, and a finger or pawl and its operating means to intermittently engage and rotate the wings of the thread-cutting piece in the cloth-plate.

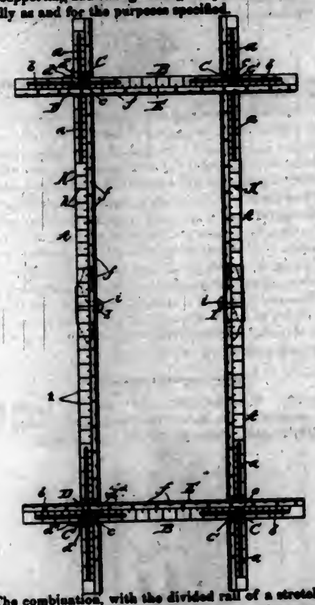
2. The combination with the work-clamp and the cloth-plate of a two-thread sewing-machine, of rotatable thread-cutting pieces mounted in said cloth-plate and having wings designed to move between the needle holes of both said work-clamp and cloth-plate, a rotatable shaft having cams mounted thereon, arms engaging said cams and adapted to operate said thread-cutting pieces, and means for operating said shaft, substantially as set forth.

3. The combination with the presser-foot of a sewing-machine and a thread-cutting device, of a cam, cam-follower, and connections to operate the presser-foot, another cam, cam-follower and connections to operate the thread-cutting device, and a primary operator, as a treadle, and connections to cause said cams to actuate their followers and hence the presser foot and thread-cutting device in alternation.

608,689. SEVERING MECHANISM FOR AERIAL TORPEDOES. JAMES A. HILL, Ravenswood, W. Va., assignor of one-half to A. E. Cole, A. D. Cole, and W. T. Cole, Maysville, Ky.. Filed Oct. 7, 1896. Serial No. 608,189. (No model.)

Claim.—1. A destructive engine of war, comprising a balloon member, an explosive-receptacle, a rope connecting same, a block mounted upon said rope carrying an arm provided with a cutting member for severing said rope, and suitable means for operating said arm, substantially as and for the purpose set forth.

2. A device of the class described, comprising a balloon member, an explosive member, a rope connecting same, and means for disconnecting said members, consisting of a block mounted upon said rope and carrying a cutting-blade operated by suitable clock mechanism to sever the rope, whereby the explosive is dropped from the balloon, substantially as shown and described.



3. A device of the class described, comprising a balloon member, a rope suspended from said member, carrying at its lower extremity an explosive, and means for disconnecting the balloon and explosive, consisting of a block having a groove in the face thereof, along which the rope passes, a cutting-blade arranged across said groove and means for operating the knife-blade to sever the rope, substantially as shown and described.

4. A device of the class described, comprising a balloon member, and explosive members, means for connecting the same, comprising a circular or other suitably-shaped support connected horizontally with the balloon-netting and at the lower end thereof, a suspending-yoke connected with said support at diametrically opposite points, from which said explosive members are suspended, and means for automatically severing the connection between the balloon member and the explosive members, substantially as and for the purpose set forth.

608,690. CURTAIN-STRETCHER. REUBEN HOFFHEIMS, Chicago, Ill. Filed Jan. 9, 1897. Serial No. 618,512. (No model.)

Claim.—1. The combination, in a stretcher, of a frame having side and end rails or pieces with adjusting-slots, a clamping-bolt for each corner of the frame passing through the slots of the side and end rail or piece, and a plate mounted and swinging on and moving with the clamping-bolt and having on one face two flanges forming a corner with side faces at right angles to each other fitting the frame-pieces at the outer corner, with the right-angle faces of the corner engaging the edge faces of the frame-pieces in every adjustment of the frame for squaring the frame and maintaining the rigidity at the corners, substantially as specified.

2. The combination, with the divided rail of a stretcher-frame, of a clamping-hinge consisting of two companion plates each having a projecting clamp end, each clamp end overlapping onto the body of the opposite plate and extending over the abutting ends of the rail on each side of the joint, for each clamp end and the body of the adjacent plate and the rail end to be rigidly clamped together and to each other when the rail is opened out for use, thereby engaging each other and supporting and strengthening the joint of the divided rail, substantially as and for the purposes specified.

3. The combination, with the divided rail of a stretcher-frame, of a fastening-hinge consisting of two companion plates, each having a clamp end overlapping onto the body of the opposite hinge-plate on each side of the rail-joint, and clamps common to the clamp end, the body of the hinge-plate and the rail end, whereby the adjacent and overlapping parts can be drawn tightly together, rigidly uniting the hinge and the rail one to the other, thereby supporting and strengthening the joint of the divided rail, substantially as and for the purposes specified.

4. The combination, in a stretcher, of a frame having side and end rails or pieces with adjusting-slots, a clamping-bolt for each corner of the frame passing through the slots of the side and end piece, a plate mounted on the clamping-bolt and having flanges standing at right angles to each other, and a guide or stop on the plate entering the slot of a frame-piece, substantially as and for the purpose specified.

5. The combination, in a stretcher, of a frame having side and end pieces, each provided with an inclined face on the inner edge, terminating in a slot or groove on each side, and a series of attaching or retaining pins, each pin formed integral with its support or base by bending a piece of wire on itself to furnish a rectangular base or support with side arms or pieces free at one end and having an outward spring for the side arms or pieces to enter the side slots or grooves of the face and engage the wall of such slots or grooves of the inclined face, and hold the pins in position when adjusted, substantially as and for the purposes specified.

6. The combination of a frame-piece having at the inner edge a supporting-face terminating in a slot or groove on each side, and an attaching or retaining pin formed integral with its support or base from a single piece of wire bent to produce a support or base having independent side arms or pieces free at one end and having an outward spring for the side arms or pieces to enter the slots or grooves of the supporting-face and lock and retain the pin in an adjusted position by the spring action, flexing the side arms or pieces in contact with the wall of the slot or groove, substantially as and for the purposes specified.

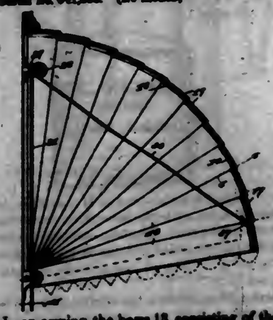
7. An attaching or retaining pin for a stretcher, consisting of a single piece of wire bent to form the pin and a support or base therefor having free arms or side pieces, wider at the open than at the closed end to give a spring action for holding the pin in an adjusted position, substantially as and for the purposes specified.

8. The combination, in a stretcher, of a frame having divided side pieces, a hinge connection for joining the side pieces, consisting of plates attached to the abutting ends of the side pieces, one on each side of the joint, each plate having a clamp end extending over onto the body of the opposite hinge-plate and the rail end each side of the joint and each plate having a slot in its edge, a pivot for the two plates, and stationary clamping pins or bolts common to the clamp end, the hinge-plate and the rail end, and entering the slots of the clamp ends for drawing the clamp end, the hinge-plates and the body of the rail firmly and rigidly against each other, substantially as and for the purposes specified.

9. The combination, in a stretcher, of a frame having divided side pieces, a hinge connection for the side pieces consisting of a plate attached to one part of the side piece with a projecting inner end having a slot in its edge and a flange on the side, a second plate attached to the other part of the side piece with a projecting inner end and having a slot in its edge, and pins or bolts entering the slots and having locking-nuts, substantially as and for the purposes specified.

10. The combination, in a stretcher, of a frame having divided side pieces, a hinge connection for the side pieces consisting of a plate attached to one part of the side piece with a projecting inner end having a slot in its edge, a second plate attached to the other part of the side piece with a projecting inner end having a slot in its edge, and having on the outer edge of the plate and its projecting end a ledge or head engaging the face of the companion plate at its outer edge, substantially as and for the purposes specified.

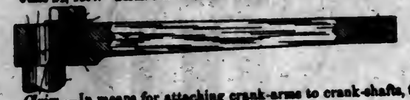
11. The combination, in a stretcher, of a divided side piece for the frame, and a hinge consisting of a plate attached to one part of the divided side piece, and a second plate attached to the other part of the divided side piece and having a ledge or head on its under face engaging the upper face of its companion plate, substantially as and for the purposes specified.



12. The combination of two companion plates forming a hinge, each plate having a clamp end, each clamp end overlapping onto the body of the opposite plate at the joint of the hinge, and clamping-bolts one on the body of each rail end, each bolt common to the clamp end, the hinge-plate and the rail end, for locking the clamp end, the body of the hinge-plate and the rail rigidly together, substantially as and for the purposes specified.

13. The combination, in a stretcher, of a frame having divided and hinged side rails or pieces each connected by a locking-hinge at the point of division and end rails or pieces, with adjusting-slots in such rails or pieces, clamping-bolts passing through the slots of the rails or pieces and squaring-plates mounted and swinging on and carried by the clamping-bolts for enabling the end pieces to be folded straight or crossed at one end, without removal of any of the parts, substantially as and for the purposes specified.

14. The combination, in a stretcher-frame, of a rail or piece having an inclined face on its inner edge, a longitudinal slot or groove on each side of the inclined face with the front or lower groove below the plane of the rear or upper groove for strengthening the rail or piece at the inner edge, and a series of sliding pins engaging the slots or grooves of the rail or piece, substantially as and for the purpose specified.

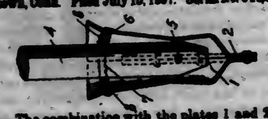


15. The combination, in a stretcher-frame, of hinged slotted side rails or pieces, slotted end rails or pieces, each rail or piece having on its inner edge a receiving-face with a longitudinal slot or groove in each side, clamping-bolts passing through the slots of the side and end rails or pieces, a series of adjustable pins each having a base movable in the slots or grooves of the receiving-face with the points of the pins below the face of the frame, and a corresponding scale or measure on the side and end rails or pieces, for securing the adjustment of the frame and a correct and perfect alinement of the pins by one and the same scale, substantially as specified.

608,691. AWNING. JOHN D. HOGAN, St. Louis, Mo. Filed June 18, 1897. Serial No. 641,220. (No model.)

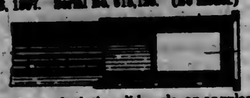
Claim.—In an awning, the bows 13, consisting of the side pieces 15 and 16 and the cross-pieces 17, and the casting 18 connecting the ends of the cross-pieces 17 to the ends of the side pieces 15 and 16; each of said castings consisting of the portions 19 and 20 formed at right angles to each other, the lug 22 projecting outwardly from the upper ends of said portions, and the lugs 23 and 24 closing the ends of the trough formed by said portions, the lug 22 of one casting extending into the trough of the next outer casting and the lugs 23 and 24 forming stops for said lug 22, substantially as specified.

608,692. MEANS FOR ATTACHING CRANK-ARMS TO CRANK-SHAFTS. THOMAS H. HOYT and JOSEPH GILLET, Milwaukee, Wis., assignors to the Milwaukee Manufacturing Company, same place. Filed June 21, 1897. Serial No. 641,542. (No model.)



Claim.—In means for attaching crank-arms to crank-shafts, the combination, of a crank-shaft having the end thereof provided with a flat beveled side, a crank-arm provided with an opening to receive the end of the crank-shaft, and with another branching opening in communication, and in longitudinal alinement, with the first-named opening, a nut fitting said branching opening, said nut provided with a beveled side registering with and engaging the flat beveled side of the end of the crank-shaft, and a screw-bolt passing into the branching opening of the crank-arm to engage the threads of the nut, said bolt being in longitudinal alinement with the crank-shaft.

608,693. FIREPROOF CALCIMINE. STANISLAU KALAMAJKOWSKI, New York, N. Y. Filed Apr. 23, 1896. Renewed Aug. 23, 1897. Serial No. 649,941. (No specimens.)

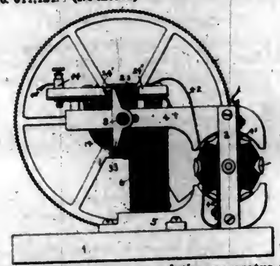


Claim.—The herein-described composition to be used as calcimine or coating, consisting of water, borax, boracic acid, sulfate of ammonia, muriate of ammonia, carbonate of lime, oxid of zinc, and glue in about the proportions specified.

608,694. FLEXIBLE BROOM-HANDLE. GEORGE H. KAVANAUGH, Middletown, Conn. Filed July 15, 1897. Serial No. 644,695. (No model.)

Claim.—The combination with the plates 1 and 2, provided with the vertical conical semicircular flanges 3 3, and a handle 4, pivoted upon said rod, of the curved rod 6 fixed in said flanges and extending through said handle, and the springs 8 8 encompassing said rod on each side of said handle, substantially as shown and described.

608,695. SLIDE-RULE. WILLIS I. R. KNIFFIN, Hoboken, N. J. Filed Jan. 6, 1897. Serial No. 618,126. (No model.)



Claim.—1. In a calculating slide-rule, an angular rule having an interior chamber and a plurality of faces provided with longitudinal cut-out portions communicating with said chamber and having its opposite edges logarithmically graduated, external guards on the ends of said rule, and a prismatic slide inclosed by said rule and working within said chamber, the ends of said slide being projected beyond the ends of said rule, said slide displaying suitable logarithmic graduations, the interior angles of the rule and exterior angles of the slide forming means for accurately adjusting said slide within said rule, substantially as set forth.

2. In a calculating slide-rule having a plurality of faces provided with longitudinal cut-out portions and having its opposite edges logarithmically graduated, external guards on the ends of said rule, a prismatic slide inclosed within said rule and displaying suitable logarithmic graduations, and an indicator or runner adapted to slide longitudinally over said rule and provided with a plurality of fins or pointers located over said slide, and extended in opposite directions, substantially as set forth.

3. In a calculating slide-rule having a plurality of faces provided with longitudinal cut-out portions and having its opposite edges logarithmically graduated, external guards on the ends of said rule, a prismatic slide inclosed within said rule and displaying suitable logarithmic graduations, and an indicator or runner entirely or partly encircling said angular rule and having a plurality of fins or pointers

extending over the exposed faces of said slide in opposite directions, substantially as set forth.

603,696. AUTOMATIC TEMPERATURE-REGULATING APPARATUS. WALTER B. LORING, Worcester, Mass. Filed Nov. 5, 1896. Serial No. 611,121. (No model.)

Claim.—1. In a temperature-regulating apparatus, the combination with a heat-controlling damper or other device, and connections to a motor, of said motor operated by electricity, and consisting of a revolving armature, a field-coil, a shaft operated by the armature through a gear loose on said shaft, but adapted to be clutched thereto to turn the same, said shaft adapted to revolve in either direction, and to be positively stopped at the end of each movement, a switch mechanism adapted to be operated automatically by the revolution of said shaft, to automatically cause the electric current to pass in one direction or the other through the field-coil, to operate the armature and the shaft in one direction or the other, and move the damper, and electrical connections from said motor to a generator or electric source, substantially as set forth.

2. In a temperature-regulating apparatus, the combination with a heat-controlling damper or other device, and connections to a motor, of said motor operated by electricity, and consisting of a revolving armature a field-coil, a shaft operated by the armature through a gear loose on said shaft, but connected therewith to turn the same, said shaft adapted to revolve in either direction, and to be positively stopped at the end of each movement, a switch mechanism adapted to be operated automatically by the revolution of said shaft, to automatically cause the electric current to pass in one direction, or the other through the field-coil, to operate the armature and the shaft in one direction, or the other, and move the damper, and electrical connections from said motor to a generator, or electric source, substantially as set forth.

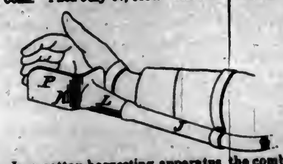
3. In a temperature-regulating apparatus, the combination with a heat-controlling damper or other device for controlling the passage of air, and connections to a motor, of said motor operated by electricity, and consisting of an armature, a field-coil, a shaft operated by the armature, through a gear loose on said shaft, but connected therewith to turn the same, said shaft adapted to revolve in either direction, and to be positively stopped at the end of each movement, by a lever or finger on said shaft engaging with a stop, or switch in the path of said lever, a switch mechanism adapted to be operated automatically by the revolution of said shaft, to automatically cause the electric current to pass in one direction, or the other, through the field-coil, to operate the armature and the shaft in one direction or the other, and move the damper; and electrical connections from said motor to a generator: and a thermostat, substantially as set forth.

4. In a motor operated by electricity, the combination with a shaft adapted to revolve in either direction, and operated by a revolving armature, and having an arm or lever fast thereon, to engage and move a switch, and stop the rotation of the shaft and said switch, and a disk fast on said shaft, of a gear or pulley loose on said shaft, and two clutch members pivoted on said gear, said clutch members adapted to extend upon the periphery of said disk, and a spring connecting the ends of said clutch members, to cause the disk to be held and turned with said gear, and allow the gear to be turned independently of said disk, when the shaft is stopped, substantially as set forth.

5. In a heat-regulating apparatus, the combination with a thermostat, connections therefrom to a motor, and said motor, operated by electricity, and adapted to operate a heat-controlling damper or dampers, and said damper or dampers, and connections therefrom to the motor, of mechanism for controlling the operation of said motor, and connected therewith, comprising an operating-lever, and means for automatically moving the same in one direction to break the circuit and stop the motor, and a clock-movement for controlling the reverse movement of said lever, to close the circuit, substantially as set forth.

6. In a motor operated by electricity, the combination with a shaft adapted to revolve in either direction, and to be positively stopped at the end of a predetermined movement, and a gear or pulley loosely mounted on said shaft, but connected therewith to turn said shaft, of a switch, or switch mechanism operated by the revolution of said shaft, substantially as set forth.

7. In a motor operated by electricity, the combination with a shaft adapted to revolve in either direction, and to be positively stopped at the end of a predetermined movement, and a gear or pulley loosely mounted on said shaft, but connected therewith to turn said shaft, of a switch or switch mechanism, substantially as set forth.



8. In a heat-regulating apparatus, the combination with an electric motor or device for controlling the movement of dampers or valves, a shaft operated by said motor to revolve in either direction, of means for controlling the operation of said shaft, comprising an operating lever or device, and means for automatically moving the same in one direction to break the circuit and stop the shaft, and means for controlling the reverse movement of said lever, substantially as shown and described.

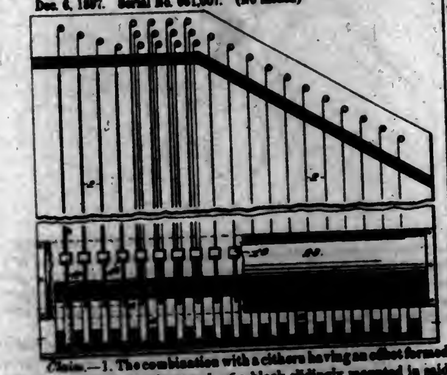
9. In a heat-regulating apparatus, the combination with an electric motor or device for controlling the movement of dampers or valves, a shaft operated by said motor to revolve in either direction, of means for controlling the operation of said shaft, comprising an operating lever or device, and means for automatically moving the same to open or close the circuit, substantially as shown and described.

10. In a heat-regulating apparatus, the combination with an electric generator, connections to an electric motor, and said motor, consisting of a revolving armature, a field coil or coils, a shaft operated by the armature and adapted to revolve in either direction, of means for controlling the operation of said shaft, comprising an operating-lever, and means for automatically moving the same in one direction to break the circuit and stop the shaft, and means for automatically controlling the reverse movement of said lever to close the circuit, substantially as set forth.

11. In a heat-regulating apparatus, the combination with a motor or device for controlling the movement of dampers or valves, a shaft operated by said motor to revolve in either direction, of means for controlling the operation of said shaft, comprising an operating lever or device, and means for automatically moving the same, substantially as shown and described.

603,697. COTTON-COLLECTING APPARATUS. CHARLES J. LOUD, Niantic, Conn. Filed July 17, 1897. Serial No. 644,948. (No model.)

Claim.—In a cotton-harvesting apparatus, the combination with means for exhausting air, and a flexible pneumatic tube, of a funnel thereon, and means for attaching it to the wrist of the operator adjacent to the palm of the hand, and a guard projecting from one side of the mouth of the funnel in a position adapted to become substantially opposite to the palm of the hand when the funnel is attached, leaving the fingers and thumb of the operator free to pick the cotton and feed it upon said guard toward the mouth of the funnel.



603,698. ATTACHMENT FOR TRUNKS OR BOXES. CHARLES G. MAXWELL, West Winsted, Conn. Filed Apr. 22, 1897. Serial No. 633,304. (No model.)

Claim.—1. In combination, the box, the cover hinged to the rear of the box, the doubly-perforated plates respectively hinged to front of box and cover, and the strap removably attached to the doubly-perforated plates and of a length which adapts it to be drawn taut when the cover is shut, all substantially as described and for the purposes set forth.

2. In combination, the box, the cover hinged to the rear of the box, the doubly-perforated plates respectively hinged to front of box and cover, and the strap provided with buckle and buckle-holes and removably attached to the doubly-perforated plates and of a length which adapts it to be drawn taut when the cover is shut, all substantially as described and for the purposes set forth.

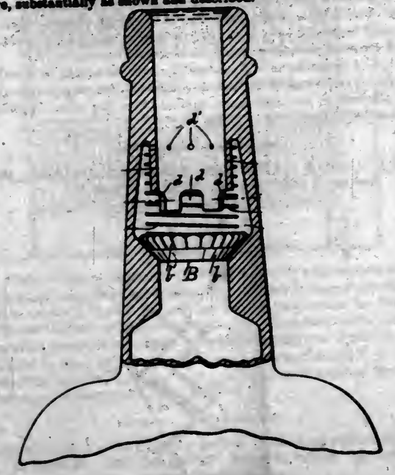
603,699. CITHERN. CHARLES T. MEYER, St. Louis, Mo. Filed Dec. 6, 1897. Serial No. 661,607. (No model.)

Claim.—1. The combination with a cithern having an offset formed in the top side of its front end, of a block slidingly mounted in said offset, which block is provided with keys for sounding the strings of the cithern, substantially as specified.

2. The combination with a cithern having an offset formed in the top side of its front end, of a block mounted to slide in said offset, spring-actuated keys operating in said block, spring-arms extending upward and rearward from the rear ends of said keys, and hammers carried by said spring-arms for striking the strings of the cithern, substantially as specified.

3. A cithern constructed with an offset in the top side of its front end, a block arranged to slide in said offset, parallel ears formed integral with and extending upward from said block, spring-actuated keys operating in the recesses between said ears, spring-arms extending upward and rearward from the rear ends of said keys, and cushioned hammers located upon the ends of said spring-arms and arranged to strike the strings of the cithern, substantially as specified.

4. A cithern constructed with an offset in the top side of its front end, a section of flexible material located in the bottom of said offset, a block arranged to slide in said offset, ears formed integral with and extending upward from said block, spring-actuated keys pivoted to operate in the recesses between said ears, a cushion located below the forward ends of said keys, cushions located in the recesses between the ears beneath the rear ends of the keys, spring-arms extending upward and rearward from the keys, hammers located upon the ends of said spring-arms, and cushions located upon said hammers, substantially as specified.



603,700. COFFEE-POT. HERBERT L. MITCHELL, Pittsburg, Pa. Filed Oct. 27, 1897. Serial No. 656,613. (No model.)

Claim.—In an apparatus for brewing coffee, the combination with a coffee-pot, of an infuser comprising an annular conical section A, provided with the flange E, and perforated partition D, and openings F, of an annular conical section E, provided with a flange G and perforated partition C, said sections being adapted to be locked together by means of the flanges B and G, substantially as described.

603,701. NON-REFILLABLE BOTTLE. ARTHUR F. MOTT and HENRY S. DUNN, Jr., Brooklyn, N. Y. Filed Aug. 28, 1897. Serial No. 649,991. (No model.)

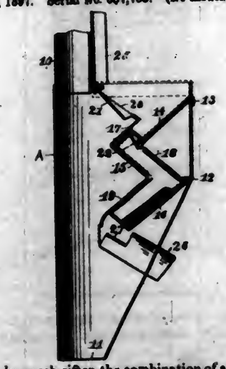
Claim.—An improvement in bottles, comprising an annular recess in the neck and a conical valve-seat formed in the lower portion thereof, a conical grooved valve for engagement with said seat, an annular flange extended downwardly in said recess having apertures therethrough for draining liquid from the bottle, and having grooves in the lower edge thereof to facilitate the outflow of liquid from the bottle, and a spring coiled around said flange and bearing upon the valve, substantially as shown and described.

603,702. TOBACCO-PIPE. WILLIAM HAY, Philadelphia, Pa. Filed Jan. 30, 1897. Serial No. 621,263. (No model.)

Claim.—In a pipe a tube adapted to be secured to the inner end of the mouthpiece and communicating therewith and having an opening in its periphery, and in its forward end, and an elongated sleeve partly fitted on said tube and having an opening adapted to register with that in the tube, a chamber being provided between the ends of said tube and sleeve and communicating with said tube.

603,703. PROPELLER. JAMES V. O'CONNOR, Brockton, Mass. Filed July 3, 1897. Serial No. 643,411. (No model.)

Claim.—1. A propeller having oppositely-situated triangular wings or vanes arranged in parallel planes and supported by a common center, the one side and base of each wing or vane being open,



and the bases positioned to direct the propulsive medium into the open side of the next succeeding wing, substantially as described.

2. A propeller having wings or vanes supported by a common central web or partition and arranged in parallel planes in alternation on opposite sides of said partition, substantially as described.

3. In a propeller, a blank consisting of a disk slitted inwardly toward the center to form triangular sections and having the corners in alternation bent in opposite directions and carried over the reverse and obverse sides of the blank to form triangular wings or vanes arranged in parallel pairs and each of which has an open side and base, and a carved wall, substantially as described.

4. A propeller having a common center, consisting of a web or partition and wings or vanes on opposite sides of said center arranged in alternation, and each series separate from the other in parallel planes, substantially as described.

608,704. ASH-SIFTER. JOSEPH PAYETTE, Worcester, Mass. Filed Nov. 8, 1897. Serial No. 657,735. (No model.)

Claim.—1. In an ash-sifter, the combination of a casing A, a frame 12 carrying screenwork-sections 15 and 16, and cover-sections 18 and 19, said sections forming inclined sifting-passages, screenwork-sections 14 and 20 forming a hopper in the upper part of the casing A, a covered spout 26 extending into the casing A to receive the sifted coal, while ashes which pass through the meshes of the screenwork-sections are retained inside the casing, and a cut-off door 22 for temporarily retaining the material to be sifted in the hopper, substantially as and for the purpose set forth.

2. In an ash-sifter, the combination of a casing A, a frame 12 carrying screenwork-sections 15 and 16 and cover-sections 18 and 19, said sections forming inclined passages, screenwork-sections 14 and 20 forming a hopper in the upper part of the casing A, a covered spout 26 extending into the casing A to receive the sifted coal, and a cut-off door 22 for temporarily retaining the material to be sifted in the hopper, the framework 12 being provided at its upper end with hooks 13, extending through sockets in the casing A to detachably support the hopper, screenwork and cover sections in position in said casing, substantially as described.

3. In an ash-sifter, the combination of a casing A, inclined, screenwork-sections 14 and 20 forming a hopper in the upper part of the casing, and inclined sifting-passages leading down from the hopper, the screenwork-section 20 being hinged so as to permit material to be introduced into the casing without causing the same to pass through the sifting-passages, substantially as described.

4. In an ash-sifter, the combination of a casing A, a frame 12 detachably secured in said casing, screenwork-sections 14, 15 and 16, and cover-sections 17, 18 and 19 carried by the frame 12 to form inclined sifting-passages, a hinged screenwork-section 20 arranged to coöperate with the screenwork-section 14 to form a hopper, or to be turned back to allow material to be introduced into the casing without causing the same to be passed through the sifting-passages, and a shut-off door 22 for the sifting-passages, a hinged cover 25 for the casing, substantially as described.

608,705. ELECTRIC INCANDESCENT LAMP. WILLIAM J. PHELPS, Chicago, Ill. Filed Sept. 7, 1897. Serial No. 650,870. (No model.)

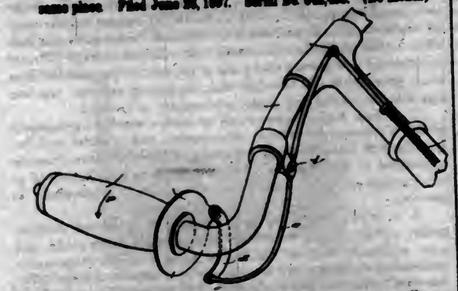
Claim.—1. An electric incandescent lamp comprising a vacuum-bulb, two sections of incandescing material, one of said sections serving as a resistance to modify the current for the other section when in series therewith, but being of too low resistance to be independently subjected to the full voltage of the electric supply, and connections whereby current may be passed to both sections in series or through the section of higher resistance alone, but not through the section of lower resistance alone.

2. A constant-potential electric lamp comprising a vacuum-bulb and two incandescing filaments, differing in resistance per unit of length, connected to receive current in series but not otherwise or separately, the resistance of said filaments being such that one glows while the other serves as a relatively dark and dead resistance to modify the current.

3. In constant-potential electric lighting the combination in one vacuum-bulb of two or more incandescent filaments or sections, the relative resistance of said filaments being such that when current is passed through two or more filaments in series one at least of said filaments glows while one at least of said filaments serves as a relatively dark and dead resistance to modify the current.

4. A constant-potential electric lamp comprising an exhausted globe, a main incandescing filament, an auxiliary filament of higher resistance per unit of length than the main filament, but having too low total resistance to be independently subjected to the full voltage for which the main filament has been designed, and connections whereby current may be passed to the main filament alone or to the auxiliary filament in series with the main filament but not otherwise.

5. An electric incandescent lamp comprising a vacuum-bulb, two sections of incandescing material, one of said sections serving as a resistance to modify the current for the other section when in series therewith, but being of too low resistance to be independently subjected to the full voltage of the electric supply, and a shunting device actuated by the longitudinal movement of the lamp in its socket, effected in screwing the same into place, whereby current may be passed to both sections in series or through the section of higher resistance alone but not through the section of lower resistance alone.

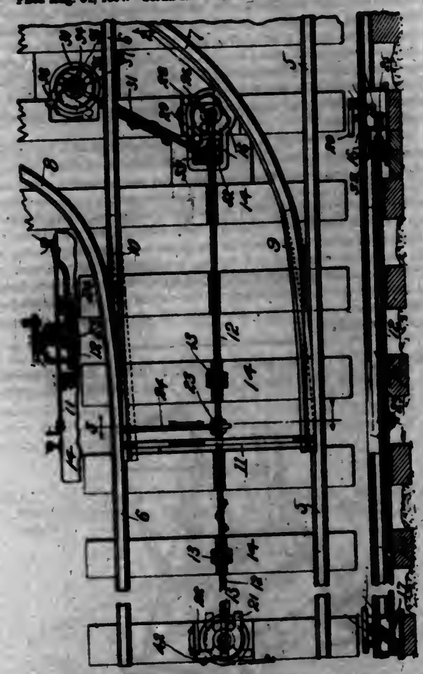


6. In constant-potential electric lighting, the combination with a vacuum-bulb, of two or more filaments or sections the relative resistance of which is such that when current is passed to two or more of the filaments in series, one at least of said filaments glows while one at least of said filaments serves as a relatively dark and dead resistance to modify the current, a base or part adapted to screw into a socket, or support and mechanism for shunting or disconnecting one or more of the filaments, actuated by the longitudinal movement of the lamp in its socket effected in screwing the same into place.

7. An incandescent lamp comprising a vacuum-bulb, two incandescing filaments therein, a base or part adapted to screw into a socket or support, a central stationary terminal constituting the point of electrical connection of one of the leading-in wires, and a movable contact adapted to engage said stationary terminal, said movable contact being rigidly attached at one part to the lamp-base.

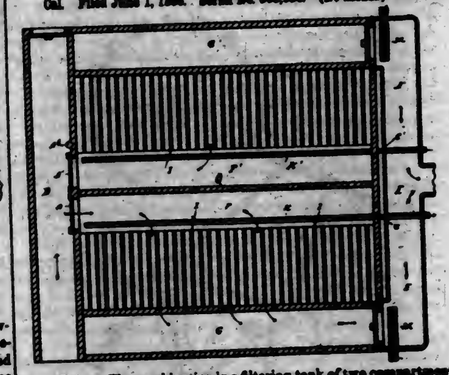
8. An incandescent lamp, comprising a vacuum-bulb, a plurality of filaments therein, leading-in wires for said filaments, and a shunting device consisting of a movable bridge-piece adapted to connect two of the terminals and supported from a relatively stationary base, said base constituting the point of electrical connection of one of the leading-in wires.

9. An electric incandescent lamp comprising an exhausted globe, a main incandescing filament adapted to withstand the full electromotive force of the electric circuit for which the lamp has been designed, an auxiliary filament having too little resistance to be directly connected to such circuit, three conducting-wires leading from the filaments (one end of each filament being electrically connected within the vacuum) a base containing the terminal of the conducting-wires normally insulated from each other and a rod or part situated on or within the base and actuated by the progressive longitudinal movement effected in screwing the base into a socket or support; in the normal position, the said rod or part carries the electric current to the main and auxiliary filaments in series when partly screwed into a socket; when screwed in somewhat farther the circuit is broken and when screwed into the socket to the utmost extent the current is turned through the main filament burning alone.



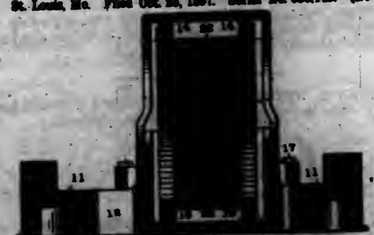
608,706. BICYCLE-BRAKE. RUDOLF RAISER, Vienna, Austria-Hungary, assignor of two-thirds to Fritz Kohn and Ludwig Reuther, same place. Filed June 26, 1897. Serial No. 642,483. (No model.)

Claim.—1. In a bicycle-brake, a handle-bar having a handle revolubly secured thereon, a brake-lever pivotally secured to the handle-bar, a link connecting the revolvable handle and the brake-lever, and connections between the brake-lever and brake-shoe, substantially as described.



2. In a bicycle-brake, a handle-bar, a handle revolubly secured thereon, a disk arranged upon the inner end of the handle having a projection extending therefrom upon one side, a brake-lever pivotally secured to the handle-bar, a link connecting one end of the brake-lever and the projection upon the disk, and connections between the opposite end of the brake-lever and the brake-shoe, substantially as described.

608,707. RAILWAY-SWITCH. JOHN F. RUBLAND, Weimton, Mo. Filed Aug. 31, 1897. Serial No. 650,166. (No model.)



Claim.—In a switch, a rock-shaft mounted parallel with the main-line rails, a second rock-shaft mounted parallel with the side-track rails, a beveled-gear connection between said shafts, a connection between the first-mentioned shaft and the movable switch-rails whereby the switch-rails are moved, shafts mounted at angles relative to the first and second mentioned shafts, beveled-gear connections between the last-mentioned shafts and the first and second mentioned shafts, and arms attached to the last-mentioned shafts for operating the same, substantially as specified.

608,708. WATER-FILTER. GEORGE SCHUMANN, San Francisco, Cal. Filed June 1, 1898. Serial No. 682,956. (No model.)

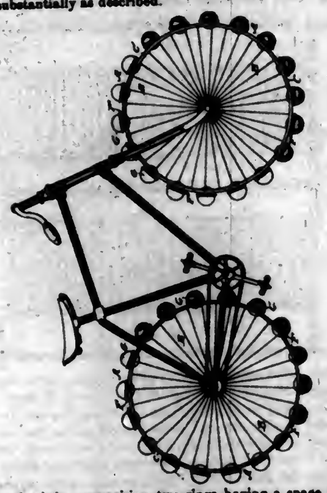
Claim.—The combination in a filtering-tank of two compartments and a supply-chamber with a series of stationary V-shaped filtering-screens arranged in each compartment, a spraying system for cleaning the said screens, a common inlet-duct for said compartments, gates controlling severally the supply from said duct thereto, drains F, F, arranged to carry off the cleaning-water, additional drains G, G', for conducting the filtered water and a common duct supplied by the latter drains substantially as set forth.

608,709. DYNAMO OR MOTOR. FERDINAND SCHWEINHART, St. Louis, Mo. Filed Oct. 23, 1897. Serial No. 656,163. (No model.)

Claim.—1. In a dynamo or motor, a suitable casing or housing for the field-magnet core cast in one piece, a laminated field-magnet core inserted in said casing from the bottom, and means for rigidly securing said core in said casing.

2. In a dynamo or motor, a suitable casing or housing for the field-magnet core cast in one piece, a base formed integral with said casing, a laminated field-magnet core inserted in said casing from the bottom and means for rigidly securing said core in said casing.

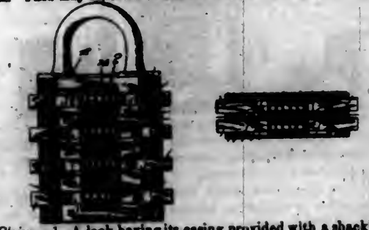
3. In a dynamo or motor, a suitable casing for the field-magnet core cast in one piece, a laminated field-magnet core inserted in said casing from the bottom and a core-retaining member entering said casing and securing said core in position.



4. In a dynamo or motor, a suitable cast casing, a core-retaining member adapted to be secured in said casing, annular ribs on said casing and core-retaining member, a laminated field-magnet core, and annular members holding the laminæ of said core in position and adapted to make contact with said annular ribs.

5. In a dynamo or motor, a suitable casing cast in one piece, a core-retaining member adapted to be inserted in said casing from the bottom, annular ribs on said casing and core-retaining member, a laminated field-magnet core, and annular members holding the laminæ of said core in position and adapted to make contact with said annular ribs.

608,710. PNEUMATIC TIRE. WILLIAM H SEWELL, Coleraine, Ireland, assignor of one-half to James Allen, Gowdenbeath, Scotland. Filed July 13, 1896. Serial No. 599,091. (No model.) Patented in England June 26, 1894, No. 13,287; in Belgium May 1, 1895, No. 118,891; in France May 1, 1895, No. 247,698; in Austria May 30, 1895, No. 45/1,915, and in Canada May 7, 1897, No. 55,963.



Claim.—1. A wheel-tire comprising two rings having a space between them and providing a rim, the series of bottomless cups or pockets located in the said space between the said rings at a suitable distance apart; and the balls or spheres having centering retaining lower flanges, and seated in the cups or pockets and projecting there-

through with their flanges engaging the lower edges of the cups or pockets; substantially as described.

2. A wheel-tire comprising two rings having a space between them and providing a rim, the series of bottomless cups or pockets located in the said space between the said rings at a suitable distance apart; the balls or spheres having encircling retaining lower flanges, and seated in the cups or pockets and projecting therethrough with their flanges engaging the lower edges of the cups or pockets, and the encircling retaining upper flanges seated on the upper edges of the cups or pockets: substantially as described.

608,711. PERMUTATION-PADLOCK. JOHN A. L. SNYDER, Scenic, Cal. Filed May 28, 1897. Serial No. 638,635. (No model.)

Claim.—1. A lock having its casing provided with a shackle-leg guide intersected by transversely-disposed tumbler-guides, a shackle-leg having tumbler-seats spaced to correspond with the intervals between the tumbler-guides, and tumblers reciprocably mounted in their guides and yieldingly held at intermediate points in their paths of movement, said tumblers having shackle-leg seats for registration with the shackle-leg guide, and being movable in either direction from their intermediate points of rest, substantially as specified.

2. A lock having a shackle-leg-engaging tumblers reciprocably mounted and yieldingly held in their normal positions at intermediate points in their paths of movement, whereby each tumbler is movable in either direction from its point of rest, substantially as specified.

3. A lock having shackle-leg-engaging tumblers reciprocably mounted in guides and capable of end for-end reversal, said tumblers being provided with shackle-leg seats for registration with a shackle-leg guide, and being yieldingly held at intermediate points in their paths of movement, whereby they are movable in either direction from their points of rest, substantially as specified.

4. A lock having shackle-leg-engaging tumblers reciprocably mounted and yieldingly held in their normal positions at intermediate points of rest, said tumblers being terminally exposed at opposite sides of the casing for movement by pressure in opposite directions, substantially as specified.

5. A lock having a casing provided with a shackle-guide intersected by transversely-disposed open-ended tumbler-guides, a shackle-leg having tumbler-seats spaced to correspond with the intervals between the tumbler-guides, and tumblers mounted for reciprocation in their guides, and exceeding the same in length, for exposure at both ends thereof, and yieldingly held at intermediate points of their paths of movement, said tumblers having shackle-leg seats for registration with the shackle-leg guide, substantially as specified.

6. A lock having its casing provided with a shackle-leg guide and intersecting tumbler-guides, a shackle-leg having tumbler-seats for registration with the tumbler-guides, and reciprocable tumblers fitted in their guides and transversely reversible to arrange different sides thereof contiguous to the plane of the shackle-leg, said tumblers being provided in different sides with shackle-leg seats for registration with the shackle-leg guide, substantially as specified.

7. A lock having transversely-reversible shackle-leg-engaging tumblers mounted for endwise reciprocation, and provided in different sides with shackle-leg seats spaced at different distances from the extremities of the tumblers, said tumblers being yieldingly held at intermediate points of their paths of movement, substantially as specified.

8. A lock having its casing provided with open-sided tumbler-guides, movable means for closing the open sides of the guides, and cross-sectionally-angular shackle-engaging tumblers reciprocably mounted in the guides and transversely reversible to arrange different sides thereof in operative position, said tumblers being yieldingly held in their normal positions, and being provided in different sides with shackle-leg seats arranged in different relative positions, substantially as specified.

9. A lock having its casing provided with open-sided tumbler-seats, and an intersecting slot or longitudinal opening, and shackle-leg-engaging tumblers reciprocably mounted in said guides and carrying coiled springs in terminal engagement with spaced shoulders on the tumblers, and arranged terminally contiguous to the walls of said slot or longitudinal opening for bearing thereon, whereby the tumblers are movable in opposite directions from their points of rest, said tumblers being provided with shackle-leg seats, substantially as specified.

10. A lock having its casing provided with shackle-leg guides intersected by transverse tumbler-guides, a shackle having its legs fitted in the shackle-leg guides and provided with tumbler-seats for registration with tumbler-guides, tumblers reciprocably mounted in the tumbler-guides and provided with shackle-leg seats for registration with the shackle-leg guides, and yieldingly held out of registration therewith, and a check-latch reciprocably mounted in one of the shackle-leg guides in the path of a shackle-leg, provided with seats for registration with the tumbler-guides, and yieldingly actuated to throw its seats out of registration with the tumbler-guides, substantially as specified.

11. A lock having its casing provided with shackle leg guides and intersecting transverse tumbler-guides, a shackle having long and short legs respectively fitted in said guides and provided with tumbler-seats for registration with the tumbler-guides, spring-actuated tumblers reciprocably fitted in the tumbler-guides and having shackle-leg seats for registration with the shackle-leg guides, a reciprocable check-latch fitted in the shackle-leg guide in which the short leg of the shackle is arranged, and having tumbler-seats for registration with the tumbler-guides, and an actuating-spring for the check-latch to maintain the latter terminally in the path of the short shackle-leg with its seats out of registration with the tumbler-guides, substantially as specified.

608,712. SWINGING HAMMOCK-CHAIR. ANTON STRAMBEY, Gravesville, Wis. Filed Dec. 31, 1897. Serial No. 663,834. (No model.)

Claim.—A swinging hammock-chair having in combination with the standards, the strips D and D', the back strips to which said strips are pivoted, the supporting-bars pivoted to the strips D near their longitudinal centers, the braces M, the foot-rest, the pivoted strips connecting the ends of the foot-rest with the outer ends of the strips D' and with the strips D, and the strips E pivoted at their upper ends to the extreme outer ends of the strips D, while their lower ends are pivoted between the ends of the foot-rest and its angles, all arranged substantially as shown and for the purpose set forth.

608,718. PHOTOGRAPHIC-PRINTING FRAME. EMANUEL W. SWINGARD, Chicago, Ill. Filed Aug. 30, 1897. Serial No. 648,914. (No model.)

Claim.—1. The combination with a printing-frame and pressure-board, of a series of cross-bars adapted to hold the board in place, said bars being hinged at one end to one side of the frame and being provided at the other end with a series of clamping and locking latches adapted to engage with suitable devices at the other side of the frame and both draw the bars toward and lock them to the frame; substantially as described.

2. The combination with a frame and pressure-board of cross-bars hinged to one side of the frame and adapted to swing across the same, pivoted links upon the opposite side of the frame and swinging levers pivoted to the free ends of the cross-bars and provided with hooks adapted to engage the links and draw the same above and past the lever-pivots, whereby the cross-bars are forced down upon the pressure-board and the downward pull of the links tends to hold the levers against unlocking; substantially as described.

3. The combination with a printing-frame and its pressure-board, of a series of clamping cross-bars adapted to hold down the pressure-board, said cross-bars being hinged at one end to one side of the frame, a series of links pivoted to the opposite side of the frame and having a limited movement outward therefrom, a series of locking-levers pivoted to the free ends of the cross-bars said provided with handles adapted to strike upon the links as the cross-bars are thrown downward and also with hooks adapted to engage the links and draw them upward above and past the lever-pivots as the levers are thrown about said pivots, whereby the striking of the lever-handles upon the links may automatically operate the locking-levers and clamp the cross-bars in place: substantially as described.

608,714. POCKET CIGARETTE-FORMER. JACOB VEITH, Kansas City, Kans. Filed Mar. 16, 1897. Serial No. 627,322. (No model.)

Claim.—A cigarette-former having a tube terminating at one end in a communicating axially-aligned hopper, of which the wall is outwardly bulged or offset to form a narrow channel 3 extending from the outer edge of the hopper to and communicating with the contiguous end of the tube and constituting a seat or guide for a packing-tool, whereby the tool operates exteriorly of the interior contour of the hopper, and projects terminally into the upper end of the tube, substantially as specified.

608,715. CONVERTIBLE SHELVES AND TABLE. EDWARD B. WESTON, Dayton, Ohio. Filed Apr. 15, 1897. Serial No. 632,197. (No model.)

Claim.—1. In a convertible shelf and table, the combination, with a series of pivoted shelves, a fixed shelf, and suitable supports therefor, of single side bars pivoted on the supports and to the shelves at or near the middle of the sides thereof, and a rear bar, pivoted to the shelves at or near the middle of the back portion thereof, with means for locking said pivoted parts, whereby the pivoted shelves may be swung in alinement with the fixed shelf and locked in any desired position, substantially as shown and described.

2. In a convertible shelf and table, the combination, with suitable supports, of a series of shelves, with bars pivoted thereto and to the supports, radially-toothed plates on the supports, with corresponding tooth-plates on the bars at their pivotal connection therewith and a rod, with means for tightening same, passing through said locking-plates, whereby same may be drawn together for locking the device in any desired position, substantially as shown and described.

3. In a convertible shelf and table, the combination, with suitable supports, of a series of shelves with bars pivoted thereto and to the supports, said shelves carrying lugs at the rear, to receive and serve as a rest for the next succeeding shelf, with locking device therefor, whereby said shelves may be converted into a rigid and secure horizontal table, substantially as shown and described.

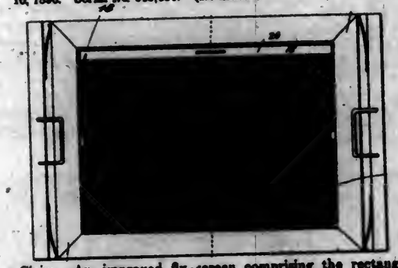
4. In a convertible table and shelf, the combination, with suitable supports, of a series of shelves with side bars pivoted thereto, and a rear bar pivoted to the shelves, said shelves carrying lugs at the rear corners and a lug at or near the center of the rear edges thereof to which said rear bar is pivoted, said lugs forming stops or rests for the next succeeding shelf, substantially as shown and described.

5. In a convertible shelf and table, the combination, with suitable supports, of a series of shelves with bars pivoted thereto and to the supports, catches pivoted to said bars at the meeting-point of the two lowest shelves, shaped to catch under the lowest shelf when adjusted as a table to hold the same rigidly in place, substantially as shown and described.

608,716. COMBINED TRACK AND WHEEL BRAKE FOR STREET-CARS. FRED W. WOELFLEBERG, Chicago, Ill. Filed July 26, 1897. Serial No. 646,060. (No model.)

Claim.—1. A combination wheel and track brake for street-cars actuated by means of the levers and bars shown and described, consisting of a body portion 20, channeled out at its bottom to receive a track-shoe, and having formed upon one side the hinge-lugs 27 and upon the opposite side the projection 23, the slide-bearing 25 and the cheek 26, and having the recess 31 across and through one end thereof, the wheel-shoe 21, having the projecting hinge portion 28 and the integral projecting portion 30 with the extension 37, the track-shoe consisting of a block of wood or other like material and the detachable shoe-clamping plate 32, whereby the track-shoe is secured to the body portion, all substantially as set forth.

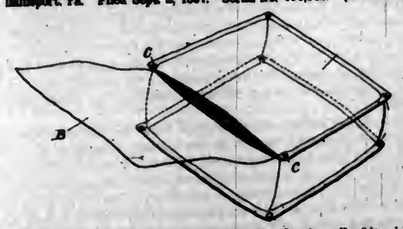
2. The combination in a combined track and wheel brake for street-cars, of the track-frame 1, having the supporting-braces 3, and the downwardly-extending oblique shoe-guides 4 provided with the central slot 6, with the brake-operating mechanism consisting of the levers 7, 8, 10, 15 and 16, the adjustable connecting-levers 9 and 11, the adjustable clamps 36, the clamping-bar 13, the adjustable bar 14, and the brake-rods 18 and 19, all substantially as shown and described.



3. In a combined track and wheel brake for street-cars, the combination of the brake-operating mechanism consisting of the levers 7, 8, and 10, the adjustable connecting-levers 9 and 11, said levers 9 having the squared portions 35, the adjustable clamps 36, the clamping-bar 13, the adjustable bar 14, the levers 15 and 16 pivotally connected to the bar 14, said lever 15 secured at one end to a fixed pivot 17, the free ends of said levers pivotally connected with the brake-rods, and the brake-rods 18 and 19, with the brake-shoes consisting of the body portion 20, having the integral hinge-lugs 27 upon one side, and the projection 23, the slide-bearing 25 and the cheek 26 upon the opposite side, the bottom thereof channeled out to receive the removable track-shoe, the clamping-plate 32 adapted to close one side of the channel, and clamp the track-shoe therein, the bolts 33 and 34 for securing said clamping-plate, the track-shoe 22 adapted to enter the channel in the body portion, the wheel-shoe 21, having the projecting portion 30 adapted to be hinged between the lugs 27, by means of the pin 29, the rearwardly-projecting portion 30 having the extension 37, across the rear face of said wheel-shoe, and into-

gral with the projecting portion 28, all substantially as shown and described.

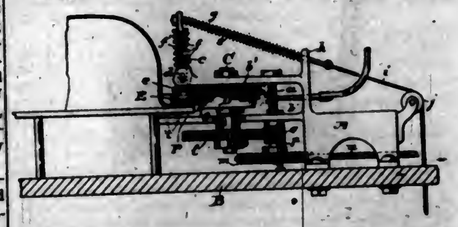
4. In a combined track and wheel brake for street-cars, the combination with the body portion or shoe holder 20, having the integral lugs 27 formed upon one side thereof, and the projection 23, the slide-bearing 25 and the cheek 26 upon the opposite side, the recess 31 across and extending through one end thereof and having its lower portion channeled to receive the track-shoe, the clamping-plate 32 adapted to secure the track-shoe, the bolts 33 and 34 for securing the clamping-plate, of the hinged wheel-shoe 21, having the projecting portion 28 and the rearwardly-projecting portion 30 with the extension 37, extending across the back of said wheel-shoe and integral with the projecting portion 28, said portion 30 and extension 37 adapted to enter the recess 31 in the end of the body portion 20, and the track-shoe 22, adapted to be secured in the channeled portion of the body 20, by means of the clamping-plate 32, substantially as set forth.



5. The combination in a brake for street-cars of the class described, of a combined brake-shoe whereby the brake may be applied to the wheel and track simultaneously, with the operating mechanism consisting of the levers 7, 8 and 10, the adjustable connecting-levers 9 and 11, provided with the turnbuckles 12, and said levers 9 having squared portions 35, the adjustable clamps 36, the clamping-bar 13, the adjustable bar 14, the pivotally-mounted levers 15 and 16, said lever 15 secured at one end to the fixed pivot 17, and the brake-rods 18 and 19, substantially as set forth.

603,717. FLY-SCREEN. JOHN G. ZOOK, Lititz, Pa. Filed Dec. 10, 1896. Serial No. 615,159. (No model.)

Claim.—An improved fly-screen comprising the rectangular frame, the reticulated netting fixed at the sides and bottom of said frame so as to form a transverse passage 15 between the top rail of the frame and the parallel upper edge of the netting, the longitudinal strip 16, pivoted between the sides of said frame, contiguous to its top rail and formed with the plane faces 20, 21, arranged at right angles to the axis of said strip and at a right angle to each other, in combination with the vertical spring 18, secured to one of the side rails and having its free end projecting into the paths of the faces 20, 21, so as to alternately engage said faces when the bar is moved to open or close the passage, substantially as shown and described.



603,718. SECTIONAL MATTRESS. WILLIAM F. ADE, Jr., Williamsport, Pa. Filed Sept. 2, 1897. Serial No. 650,316. (No model.)

Claim.—1. A mattress or mattress-section having all of its sides permanently united with its top and bottom except a slit-like opening along one edge between the top and one of the sides, said mattress having a flap on one of the fixed sides opposite said slit-like opening, said flap being passed through said opening and normally held by pressure of the filling against the top of the mattress for closing the opening.

2. A mattress or mattress-section having all of its sides permanently united with its top and bottom except a slit-like opening along one edge between the top and one of the sides, and a flap forming an extension of one of the vertical sides of the section and adapted to be tucked into the mattress through said opening and be finally held by the pressure of the filling against the fixed outer covering and serving to securely close said opening.

603,719. HAT-BRIM-CURLING MACHINE. JOHN AGAR, East Orange, N. J. Filed Apr. 20, 1896. Serial No. 588,467. (No model.)

Claim.—1. In a hat-brim-curling machine, the combination with the frame or housing, of a shaft journaled vertically therein; a flanged wheel rigidly mounted upon said shaft, a gear-wheel rigidly connected with said flanged wheel, a vertically and laterally movable shaft mounted in the housing, a wheel E, having a convex periphery mounted upon the lower end of said shaft, a gear-wheel secured to said wheel E, meshing with the gear of said flange-wheel, means for rotating said flange-wheel and means for operating said shaft vertically and laterally as described, and for the purposes set forth.

2. In a hat-brim-curling machine, the combination with the frame or housing thereof, of a shaft journaled vertically therein; a flanged wheel rigidly mounted upon said shaft; a gear-wheel rigidly connected with said flanged wheel; a slotted shaft vertically mounted in the housing, a pin in the housing through the slot whereby the shaft is capable of a vertical and lateral movement; a wheel E having a convex and serrated periphery mounted upon the lower end of said shaft; a gear-wheel secured to said wheel E, meshing with the gear of said flanged wheel and means for operating said shaft vertically and laterally as described and for the purposes set forth.

3. In a hat-brim curling machine, the combination with the flanged wheel and the wheel having a convex periphery of an adjustable guide P, arranged beneath the flange of said flanged wheel, and having a concaved way or passage p', corresponding with the concavity on the periphery of the said flanged wheel, the wheel having the said convex periphery being arranged to press the felt against both said guide and flanged wheel, and means for operating said wheels, substantially as set forth.

4. In a hat-brim-curling machine, the combination with the flanged wheel and the wheel having a convex periphery and means for operating said wheels, of a guide to operate in conjunction with said wheels to receive the curled hat-brim and to fix the curve thereof, a curler supplemental to said flanged and curved wheels to receive the hat-brim as it passes through said guide and to increase and perfect said curve thereth and means for adjusting said guide and curler relative to each other and to the wheels as described, and for the purposes set forth.

5. In a hat-brim-curling machine, the combination, with the flanged wheel and the wheel having a convex periphery and means for operating said wheels, of a two-part curler q, having a curved passage-way through which the felt is forced by the wheels and screws for holding said parts together, whereby the parts may be separated to a greater or less extent for adjusting the size of the passage-way, as described and for the purposes set forth.

6. In a hat-brim-curling machine, the combination, with the frame provided with a housing, of a vertically and laterally movable shaft mounted in the housing, the lower end of which is provided with a wheel having a convex periphery and the intermediate portion of which is provided with a pin, a coiled spring upon the shaft, one end of which engages with the housing and a portion of the remainder of the spring engages with the pin, whereby the rotation of the spring around the shaft changes the tension of the spring and mechanism cooperating with said wheel to curl the brim and means for operating said parts as described, and for the purposes set forth.

7. In a hat-brim-curling machine, the combination, with a frame, provided with a housing and a perforated portion, of a grooved wheel mounted in the frame, a shaft pivotally secured in the housing, the lower end of which is provided with a convex wheel, means for operating said wheels, a rod extending from the upper end of the shaft through the perforated portion of the frame, a spring between the end of the shaft and the perforated portion, and a cord for moving the rod, as described and for the purposes set forth.

8. In a hat-curling machine, the combination with the flanged and convex wheels and means for operating and heating the same, of a curler q, adapted to receive the partly-curled felt after it leaves the said wheels, said curler comprising an upwardly-curved part q'', and a downwardly-bent part extending from the upper part of said part q'', whereby the bent brim is given a downward bend at its edge, substantially as set forth.

9. In a hat curling machine, the combination with the flanged and convex wheels, and means for operating and heating the same, of a curler, q, arranged adjacent to said wheel and adapted to receive the partly-curled hat-brim after leaving said wheels, said curler comprising an upwardly-bent part q'', and a downwardly and inwardly bent part q''', whereby the partly-curled brim is given a downward and inward bend approaching a spiral shape at its edge, after leaving said wheels, substantially as set forth.

10. In a hat-curling machine, the combination with the flanged and convex wheels, and means for operating and heating the same, of a curler q, arranged adjacent to said wheels and adapted to receive the partly-curled hat-brim after leaving said wheels, said curler comprising an upwardly-bent part q'', and a downwardly, inwardly and upwardly turned part or extension q''', adapted to give to the partly-curled edge of the brim, a spiral twist or bend after it passes from between said wheels, substantially as set forth.

11. In a hat-curling machine, the combination with the flanged and convex wheels, and means for operating and heating the same, of a spiral and tapering curler, q, adapted to give a spiral twist or bend to the edge of the hat-brim after it passes from said wheels, substantially as set forth.

12. In a hat-curling machine, the combination with the flanged and convex wheels, and means for operating and heating the same, of a curved and tapering curler, adapted to receive the partly-curled brim after it passes from the said wheels and gradually increase and tighten the curl, substantially as set forth.

13. In a hat-curling machine, the combination with the curling parts D, E, consisting of concave and convex members adapted to give a partial curl to the brim, and means for heating the same, and moving the felt therebetween, of a curler q, curved and tapering in plan, and spiral in end view, substantially as and for the purposes set forth.

14. In a hat-curling machine, the combination with a concavously-flanged wheel, and means for operating the same, the rotary shaft having the convex wheel, means for forcing the said convex wheel toward the flanged wheel with a yielding pressure of a guide fixed adjacent to said flanged wheel, the convex wheel operating between said fixed guide and flanged wheel, substantially as set forth.

15. In a hat-curling machine, the combination with the concavously-flanged wheel, and means for operating the same, the rotary convex wheel and means for operating the same, heating means and means for forcing said convex wheel toward said flanged wheel, of a guide having a C-shaped part extending close to said flanged wheel, and presenting its concave surface to the convex wheel which supplements said flanged wheel in resisting the pressure of said convex wheel in curling the brim, substantially as set forth.

16. In a hat-curling machine, the combination with the concavously-flanged wheel, and means for operating the same, the rotary convex wheel, and means for operating the same and heating means, of a fixed guide having a C-shaped part extending underneath the flange of said flanged wheel into close relation to said flanged wheel, the convex wheel lying opposite the joint between said parts to press the felt against both parts, substantially as set forth.

17. In a hat-curling machine, the combination with the concavously-flanged wheel, and means for operating the same, the rotary convex wheel, and means for operating the same, and heating means, of a guide having a flaring mouth extending into close adjacency to said flanged wheel, and supplementing the trowing and curling surface thereof, the convex wheel lying opposite both said parts and pressing the felt against the two, substantially as set forth.

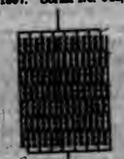
18. In a hat-curling machine, the combination with the flanged wheel, and convex wheel, and means for operating the same and heating means, of a guide extending beneath the flange of the flanged wheel opposite the convex wheel, and a curler curved and tapering in plan and spiral in end view, and receiving the partially-curled brim, substantially as and for the purposes set forth.

19. In a hat-curling machine, the combination, with a concavously-flanged wheel, of a convex wheel beneath said flange, a fixed guide adjacent to the periphery of the flanged wheel, the convex wheel operating between said fixed guide and the flanged wheel, and operating devices, substantially as set forth.

603,720. PIPE-COUPLING. ANDREW J. AVERY, Dunkirk, N. Y. Filed Aug. 17, 1891. Serial No. 402,570. (No model.)

Claim.—A pipe-coupling having in combination a sleeve screw-threaded at one end to receive a screw-threaded pipe and adapted to have a pipe telescoped into the other end, a collar or ring entering this end, screws for forcing said collar or ring into said sleeve, a rib on the inside of said sleeve, a packing-ring between said rib and collar, a jacket for said coupling forming a chamber adapted to be filled with a fluid and packing-rings and collars for said jacket to prevent the escape of said fluid, substantially as set forth.

603,721. PIPE-COUPLING. ANDREW J. AVERY, Dunkirk, N. Y. Original application filed May 23, 1891, Serial No. 394,363. Divided and this application filed Dec. 2, 1896. Serial No. 492,573. (No model.)



Claim.—1. In a pipe-coupling, the combination with the adjoining pipe-sections provided with ends tapered toward the extremity by a gradual reduction in the thickness of the pipe though not of the interior diameter thereof, said tapered part being provided with screw-threads of substantially equal depth, of a rigid non-expanding collar connecting such pipe ends and provided with screw-threads of substantially equal depth, substantially as set forth.

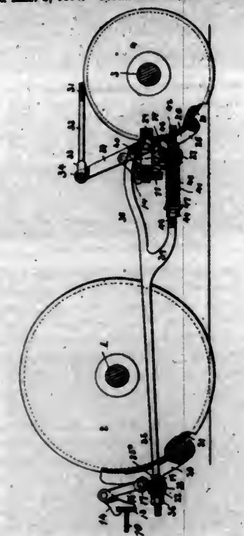
2. In a pipe-coupling, the combination with the adjoining pipe-sections provided with ends tapered toward the extremity by a gradual reduction in the thickness of the pipe though not of the interior diameter thereof, said tapered part being provided with screw-threads of substantially equal depth, of a rigid non-expanding collar connecting such pipe ends and tapering outwardly toward the ends by a gradual reduction in the thickness of the collar though not of its exterior diameter, the tapering ends of said collar being provided with screw-threads of substantially uniform depth, substantially as set forth.

3. In a pipe-coupling, the combination with the adjoining pipe-sections provided with ends tapered toward the extremity by a gradual reduction in the thickness of the pipe though not of the interior diameter thereof, said tapered part being provided with screw-threads of substantially equal depth, of a rigid non-expanding collar connecting such pipe ends and provided with screw-threads of substantially equal depth, and calking-grooves in the ends of the collar beyond the screw-threads, substantially as set forth.

4. In a pipe coupling, the combination with the adjoining pipe-sections provided with ends tapered toward the extremity by a gradual reduction in the thickness of the pipe though not of the interior diameter thereof, said tapered part being provided with screw-threads of substantially equal depth, of a rigid non-expanding collar connecting such pipe ends and tapering outwardly toward the ends by a gradual reduction in the thickness of the collar though not of its exterior diameter, the tapering ends of said collar being provided with screw-threads of substantially uniform depth, and calking-grooves in the ends of the collar beyond the screw-threads, substantially as set forth.

603,722. ELECTRIC CONDENSER. CHARLES S. BRADLEY, Avon, N. Y. Filed July 20, 1897. Serial No. 646,330. (No model.)

Claim.—1. An electric condenser having as a dielectric stearate of lead.



2. An electric condenser having between its several plates a layer of stearate of lead of uniform thickness.

3. An electric condenser having its several plates separated by a fibrous insulating material the pores and meshes of which are filled with stearate of lead.

4. An electric condenser having between its several plates a spacing insulating material containing a plurality of transverse openings filled with a material of higher specific inductive capacity whereby part of the inner space between the plates is filled solely with the latter material.

5. An electric condenser having between its several plates a spacing insulating material having a plurality of transverse openings filled with stearate of lead.

603,723. DIFFERENTIAL BRAKE MECHANISM. JOHN A. BRILL and WALTER S. ADAMS, Philadelphia, Pa.; said Adams assignor to said Brill. Filed Mar. 3, 1897. Serial No. 625,891. (No model.)

Claim.—1. In a brake mechanism for a truck of the maximum-traction class having large and small wheels, and means for differentiating the brake-pressure exerted upon the large and small wheels, comprising shoes, and connecting means therefor for each of the sets of wheels, a primary lever supported on the truck, a connection between the primary lever and the shoes for the large wheels whereby said shoes are applied directly to the large wheels through the operation of said lever, a movable connection between said primary lever and the shoes of the small wheels, and a spring or springs interposed in said last-mentioned connection to oppose the application of pressure to said smaller wheels, substantially as described.

2. In a brake mechanism for a truck of the maximum-traction class having large and small wheels, of means for applying a differentiated braking pressure on the large and small wheels, comprising shoes, and connecting-beams for each of the sets of wheels, a primary lever supported on the truck, an inflexible connection between said lever and the beam of the large wheel-shoes, an inflexible arm leading from said lever to the beam of the small wheel-shoes, and a spring interposed between said arm and latter beam, substantially as described.

3. The combination with a truck of the maximum-traction class having large and small wheels, of the brake mechanism comprising a primary lever pivoted on the truck, brake-shoes, of beams for connecting the shoes in pairs, a rod connecting said primary lever and the shoe-beam for the large wheels, a supplemental rod between said first-mentioned rod and the shoe-beam for the small wheels and movably connected with said latter beam, both rods moving in the same direction, a spring between the supplemental rod and its beam, and an abutment on said supplemental rod on the other side of the beam, substantially as described.

4. In a brake mechanism, the combination with the shoes and means for operating the shoes in the same direction, beams connecting the shoes in pairs, a pair of operating-levers, rods connecting each lever with proximate end of one beam, and a spring between each of said rods and the other beam, said springs being located in advance of the last-mentioned beam, substantially as described.

5. In a brake mechanism, the combination with the shoes, and paired beams connecting the shoes, a brake-rod engaging one beam, an extension 39 from said rod movably engaging the opposing beam, a nut 45 on the end of the extension outside of the latter beam, a spring on the extension abutting against said beam on the side opposite said nut, and a nut 44 on the extension abutting against the opposite end of the spring, substantially as described.

6. In a brake mechanism, the combination with the shoes, and paired beams connecting the shoes, a brake rod engaging one beam, an extension 39 from said rod movably engaging the opposing beam, a nut 45 on the outer end of the extension, a spring on the extension abutting against said beam on the side opposite said nut, and means on the extension for altering the tension of said spring, said means abutting against the inner end of the spring, substantially as described.

7. The combination with the brake-shoes, of the beams connecting the shoes in pairs, an operating-lever, a brake-rod extending between said beams and movably engaging both of said beams, a connection between the rod and said lever, and a spring interposed between one of the said beams and said rod to oppose the application of its shoes to the wheels, substantially as described.

8. In a brake mechanism, the combination with the shoes and beams connecting said shoes in pairs, of a primary lever fulcrumed at its end, rods extending between one of said beams and secured to said primary lever between its power end and fulcrum, a thrust-bar operated by said lever, and a spring or springs interposed between said thrust-bar and the opposing beam, said bar and beam having a movable connection, substantially as described.

9. In a truck brake mechanism, the combination with the shoes adapted to be moved in the same direction, opposing beams connecting the shoes in pairs, one of said beams being located between the wheels, the other outside of the wheels, a brake-rod passing loosely through the beams, means for moving the rod, abutments on the rod, one of the abutments being between the wheels and the other outside of the wheels, and a spring between one of the beams and one of said abutments, substantially as described.

10. The combination with the shoes and beams, of the upright lever fulcrumed at its end upon the car-truck, the inflexible brake-rod secured to one beam at one end and to the primary lever at its other end between the power end and fulcrum of said lever, an extension of said rod movably engaging the other beam, an abutment on said extension, and a spring between said abutment and said beam, substantially as described.

11. The combination with the shoes, and beams connecting them, of the primary lever, the brake-rod extending between one of said beams and pivotally secured to said lever, an extension of said rod movably engaging the other beam, an abutment on said extension, a spring interposed between said abutment and said beam, and an abutment on said extension for said beam, substantially as described.

12. The combination of the primary lever, the shoes, and the beams connecting said shoes in pairs, a rod extending between one of said beams and said primary lever, and an extension of said rod movably connected with the other beam, substantially as described.

13. In a brake system, the combination of the brake-shoes, beams, and operating means therefor, of the brake-rod connected at one end with one beam, and at the other with said means, and an extension from said rod connected with another beam of said system, substantially as described.

14. In a brake mechanism, the combination of the brake-shoes, beams, and operating means therefor, of the brake-rod connected at one end with one beam, and at the other with said means, an extension from said rod movably connected with another beam of said system, and a spring interposed between the extension and the latter beam, substantially as described.

15. The combination of the primary lever, the shoes and beams connecting said shoes in pairs, rods extending between one of said beams and said primary lever, and an extension of said rod movably connected with the other beam, a spring on said extension, one end of which abuts against said beam, and the nuts 44, 45 respectively forming an adjustable abutment for said spring and said beam, substantially as described.

16. The combination with the shoes, beams connecting said shoes in pairs, the primary lever, a rod extending between one of said beams and said primary lever, an extension from said rod movably engaging the other beam, a spring on said extension abutting against said beam, and further means on said extension for contesting with said beam, said means being held away from said beam by said spring, substantially as described.

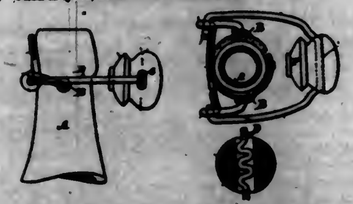
17. The combination with the shoes, and the beams connecting said shoes in pairs, of the primary lever, a brake-rod extending between said lever and one of said beams, an extension from said rod movably engaging the other beam, a shoulder formed on said extension and adapted to engage said beam; an abutment on said extension, and a spring extending between said abutment and said beam, substantially as described.

18. The combination with the cross-bar 11, the hanger 29 extending therefrom, the upright lever 28 fulcrumed at its end to said hanger, the brake-shoes 20 and connecting-beam 23, the shoes 26 and connecting-beam 27, the hanger for supporting said last-mentioned shoes from said cross-bar, a brake-rod 35 secured at one end to the beam 23, said brake-rod having a bifurcated end 36, 39, the upper arm 36 being secured to said brake-lever adjacent the latter's fulcrum, the lower arm 39 movably engaging the beam 27, an abutment on said arm 39, and a spring interposed between said abutment and said beam, substantially as described.

19. The combination of the shoes 20, a brake-beam movably connected to said shoes at its ends, the upright lever 28, the shoes 26, and connecting-beam 27, the forked connecting-rod, one end of which is connected with the beam 23, the upper fork connecting the primary lever, the lower fork movably connected with the beam 27, an abutment on the lower fork, and a spring between said abutment and said beam 27, substantially as described.

20. The combination with the shoes 20 and beam 23, the upright levers 28, the equalizing-bar 31 and extensions 32 pivotally secured to the upper end of said upright levers, forked rods, each of which is secured at one end to the beam 23, the upper fork of each of said rods being secured to one of said upright levers above the latter's fulcrum, the lower fork movably engaging the beam 27, an abutment on said lower fork, and a spring between said abutment and said beam, substantially as described.

603,724. BOTTLE-STOPPER. LEWIS H. BROOKS, Jersey City, N. J. Filed Feb. 6, 1897. Serial No. 622,367. (No model.)



Claim.—1. The combination with the stopper having a peripheral groove, of an integral bail-wire having a curved portion to pass around the stopper in such groove and bent to extend down at each side of the stopper and the neck and a binding-wire extending from one bend to the other to hold the bail and stopper rigidly together, substantially as specified.

2. The combination with the stopper and a bail-wire rigidly connected thereto, of a lever to which the lower ends of the bail-wire are pivoted, and a bail-turning lever for swinging the bail and stopper and for supporting them when the bottle is open, substantially as set forth.

3. The combination with the stopper and the bail-wire, of a binding-wire for holding the bail-wire and the stopper rigidly together, a neck-band and a lever pivoted upon the neck-band and pivoted to the bail-wire, a bail-turner having eyes at its ends sliding upon the bail-wire and a pivot at the neck-band for the bail-turner, whereby the stopper is brought into position above the mouth of the bottle by the action of the bail-turner, substantially as set forth.

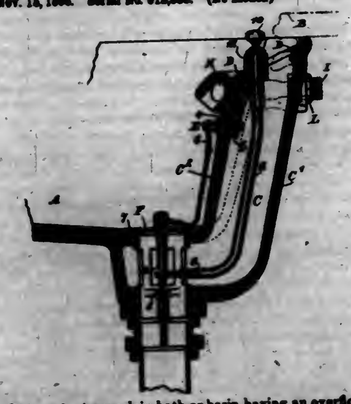
603,725. BOTTLE-STOPPER. LEWIS H. BROOKS, Jersey City, N. J. Filed May 18, 1897. Serial No. 637,003. (No model.)

Claim.—1. The combination with the stopper having a transverse horizontal mortise, of a bail-wire having several horizontal corrugations fitting the horizontal mortise, the bail-wire at the ends of the mortise being vertical at the sides of the stopper and extending down to the pivots of the lever, substantially as specified.

2. The combination in a bottle-stopper with the neck-band and lever, of a stopper and a bail, one end of the wire of which bail, beyond the pivoted connection to the lever, forms a stop for holding the stopper with the bail substantially horizontal, substantially as set forth.

3. The combination in a bottle-stopper with the neck-band and lever pivotally connected, of a bail and a stopper having a mortise through which passes the bail-wire, the same being corrugated at this place to hold the stopper from turning upon the bail-wire, there being a projecting end of the bail-wire beyond the pivotal connection to the lever for forming a stop to hold the bail substantially horizontal, as set forth.

608,726. ELASTIC WHEEL-TIRE. ALBERT L. CODET, Brouville, France. Filed Dec. 28, 1897. Serial No. 663,122. (No model.) Patented in France Oct. 15, 1896, No. 260,464.



Claim.—1. As a new article of manufacture, a card-fillet having the card-teeth embedded in elastic material to form a material suitable for the tread of an elastic wheel-tire, or for making boot-soles &c., substantially as specified.

2. An elastic tire for wheels formed of a card-fillet in combination with a covering mass of india-rubber in which the card fillet and teeth are embedded substantially as specified.

3. An elastic tire for wheels formed of a card-fillet in combination with a covering mass of india-rubber in which the card fillet and teeth are embedded, and with backing-strips of metal and india-rubber substantially as specified.

608,727. BASIN-FIXTURE. EDWARD HANNABS, Brooklyn, N. Y., assignor to The J. L. Mott Iron Works, New York, N. Y. Filed Nov. 18, 1896. Serial No. 612,836. (No model.)

Claim.—1. A porcelain bath or basin having an overflow-waterway at one side terminating with an open upper end below the top of such bath or basin, and having a perforation through the wall of such waterway, in combination with a removable perforated plate or strainer covering the upper end of such waterway, and a projection extending down from such plate within the waterway, and a metallic connection extending through the hole and engaging the downward projection for holding the strainer-plate firmly in position upon the porcelain but allowing for its easy removal for cleaning the parts, substantially as set forth.

2. The porcelain bath or basin having an overflow-waterway at one side and a perforation in the wall thereof and a waste-waterway at the bottom, in combination with a valve for closing the waste-waterway, a plate on the upper end of such waterway forming a guide, a removable valve-lifter extending down through the strainer-plate and through the waterway and acting upon the valve, a rigid connection passing through the perforation in the waterway for removably holding the guide for the valve-lifter to the porcelain, substantially as set forth.

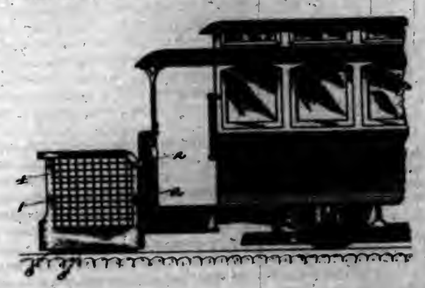
3. The porcelain bath or basin having a waste-opening in the bottom, and an overflow-waterway at one side, with an open upper end below the top of the bath or basin, in combination with a valve for closing the waste-opening, a strainer-plate at the upper end of the overflow and a removable lifter passing through such strainer-plate and waterway and extending laterally to the valve, there being a guide upon the strainer-plate through which the lifter passes, means for sustaining the lifter and valve when raised, and means for securing the strainer-plate within the upper end of the overflow-waterway, substantially as set forth.

4. The porcelain bath or basin having a waste-opening in the bottom and an overflow-waterway at one side with an open upper end below the top of the bath or basin, in combination with a valve for closing the waste-opening, a strainer-plate at the upper end of the overflow-waterway and a removable lifter passing vertically through the strainer-plate and waterway and extending laterally to the valve

whereby the strainer-plate forms a guide for the lifter and also sustains the same and the valve when raised, and a metallic connection passing through a hole in the wall of the waterway for rigidly but removably connecting the support for the valve-lifter, substantially as set forth.

5. The bath or basin having an overflow-waterway at one side with the top edge thereof below the top edge of the bath or basin and over which edge the water passes freely into the overflow, and an integral tube extending around the overflow-waterway and having an opening for the discharge of water into the bath or basin, and an opening at the other end outside the bath or basin for a connection to the water-supply pipe, substantially as set forth.

6. The combination with a bath or basin having an integral overflow-waterway at one side and an opening at the bottom for the waste water, of a plug or valve for closing the waste opening, a strainer-plate at the upper end of the overflow-waterway, a projection extending down into the waterway and a securing device for the same passing through a hole in the inner wall of the waterway, a lifter passing through such strainer-plate and connected at its lower end with the valve for lifting such valve, substantially as set forth.



7. The bath or basin having an overflow-waterway at one side with the top edge thereof below the top edge of the bath or basin and forming the dam for the overflow, and an integral tube extending around the edge of the dam, an opening through the bath or basin for the reception of hot and cold water connections, there being a discharge-opening near the middle of such integral tube, substantially as set forth.

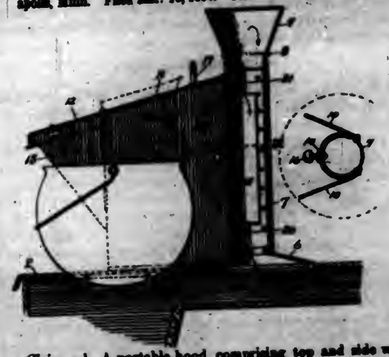
8. The bath or basin having an overflow-waterway at one side and an opening in the bottom for the waste water, in combination with a plug or valve for closing the waste-opening and a guide for the same, a strainer-plate at the upper end of the overflow-waterway and means for securing the same firmly in position, a lifter passing down through the strainer-plate and having an opening at the lower end through which the valve-stem passes, there being a shoulder upon the valve-stem against which the lifter acts, substantially as set forth.

9. The porcelain basin or bath having an opening in the bottom for the waste water and an integral overflow-waterway at one side, the inner wall of which projects within the basin and the upper end terminates below the top of the basin, in combination with a removable strainer-plate at the upper end of such waterway, means for securing the same permanently in position, a lifter passing through the strainer-plate and terminating at the lower end in an eye, means for sustaining the lifter in an elevated position upon the strainer-plate, a valve at the waste-water opening having a shoulder and a stem passing through the hole in the lower end of the lifter, and a guide for said stem, substantially as set forth.

10. A bath or basin having a waste-opening and an integral overflow-waterway at one side with an inclined upper end below the top edge of the bath or basin, in combination with a strainer-plate at the upper end of such waterway, a projection extending from the strainer-plate down within the waterway, a screw passing through a hole in the inner wall of the waterway and engaging the said projection for holding the strainer-plate permanently in position, a valve at the waste-opening, a lifter passing through the strainer-plate and bent near the lower end so as to extend to the valve and terminating as an eye through which the valve-stem passes, substantially as set forth.

603,728. CAR-FENDER. ELIZA M. JOHNSON, Brooklyn, N. Y. Filed Sept. 9, 1897. Serial No. 651,040. (No model.)

Claim.—A car-fender of V shape having a rigid base of two flanges 6 and 7 which support a strip of rubber or other yielding material 5 beneath them, in combination with vertically-arranged walls of lacing material, together with hooks for attaching the fender to a car and braces 11, 11 located in the rear of and near the base of the fender, substantially as described.

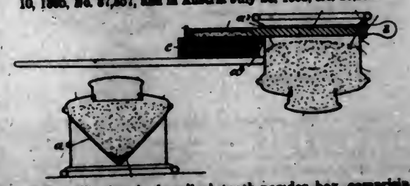


603,729. LETTER-PRESS BOOK. ABRAHAM KAHN, Frankfort-on-the-Main, Germany, assignor of one-half to Hofbuchdrucker Opferbunker Fabrik C. Holzwarth, Hofbuchdruck, Germany. Filed Sept. 15, 1897. Serial No. 651,734. (No model.)

Claim.—1. A copying-book having hinged covers, one cover having a short break therein and the other cover having a long flexible break therein, substantially as described.

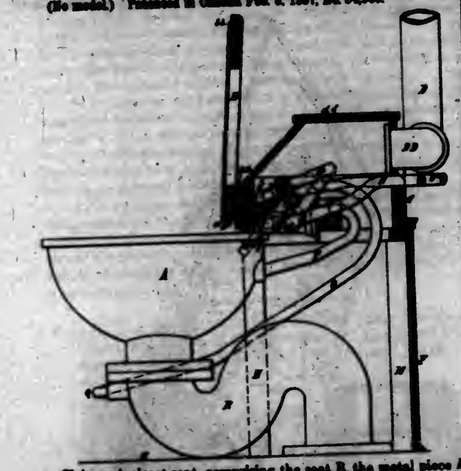
2. A folding copying-book having leaves contained between covers, one of said covers having a break whereby it can be folded upon itself and the other of the said covers having a long flexible break embracing the bend of the folded leaves when the book is folded.

603,730. PORTABLE STOVE-HOOD. LOUIS P. KELLER, Minneapolis, Minn. Filed Mar. 16, 1897. Serial No. 627,702. (No model.)



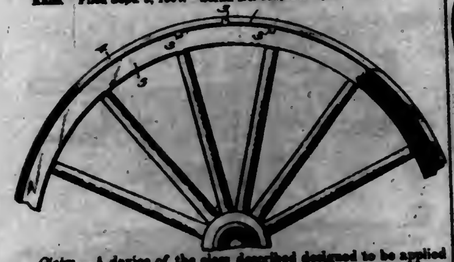
Claim.—1. A portable hood, comprising top and side walls, in combination, with the down pipe or flue, open at its lower end and having a condenser at its upper end, said down-pipe provided with an opening in its inner side, substantially as described.

2. A portable stove-hood, comprising top and side walls, in combination, with the down-pipe open at its lower end and having a flange or base to cover a stove-hole, said pipe being formed within the side walls and having a slot or opening in its inner side and a slide provided in said slot, as and for the purpose specified.



3. A portable stove-hood, comprising an inclined top and diverging side walls, said side walls together forming a V, in the opening of which a utensil may be placed, a down pipe or flue vertically arranged in the angle between the side walls, said pipe having a slot or opening in its inner side and provided with a flaring base of a size to cover a stove-hole, and said top slanting downwardly from the upper end of said pipe, substantially as described.

603,731. TOOTH-POWDER BOX. CHARLES MILLERTON, Clifford, England. Filed Jan. 30, 1897. Serial No. 621,345. (No model.) Patented in England Nov. 22, 1894, No. 22,573; in France July 10, 1895, No. 248,801; in Belgium July 10, 1895, No. 116,496; in Germany July 10, 1895, No. 87,857, and in Austria July 22, 1895, No. 30,226.



Claim.—The herein-described tooth-powder box, comprising a casing having inclined or V-shaped walls, the apex of which is at the lower end of said casing, a slide projecting through the sides of said casing adjacent to the lower edge thereof and adapted to engage the lower end of the V-shaped walls, said slide being longer than the width of said casing and being provided at one end with a knob or handle and at the opposite end with shoulders or flanges, and adjacent thereto with a longitudinal recess on the upper side thereof, the portion of said slide containing said recess being adapted to be projected beyond the side of the said casing when the end containing the handle is pushed inwardly, said casing being provided with a closed cover, substantially as and for the purpose described.

603,732. COMBINATION WATER-CLOSET, SEAT, &c. PHILIP NICHOLS, Toronto, Canada. Filed Mar. 31, 1897. Serial No. 630,179. (No model.) Patented in Canada Feb. 6, 1897, No. 54,969.

Claim.—A closet-seat, comprising the seat B, the metal piece A, the india-rubber *c c*, the box C, the flushing-valve L, its screw-head B^2, the branch and its three-way branch junctions M on each side of said valve, the cold-water-supply pipe N and hot-water-supply pipe O^2 provided with a tap R, the flushing-pipe P and closet bowl A, the flushing-pipe Q and trap R, the waste-water branch T of said valve and said closet-bowl, the chair V its hinged rear leg and support H, its detached rear leg W and support H, the chair-seat and back closet-seat curtain and said bowl, and the chain, all arranged and combined substantially as and for the purpose hereinbefore set forth.

603,733. TIRE-TIGHTENER. JAMES H. COFER, White City, Kans. Filed Sept. 9, 1897. Serial No. 651,067. (No model.)

Claim.—A device of the class described designed to be applied to a wheel after the same has become worn and adapted to tighten the tire, and comprising a strip of metal designed to be driven between the tire and the felly and adapted to extend longitudinally of the same and provided at one side with a longitudinally-disposed beveled edge 2, forming a wedge-shaped portion to enable the device to be readily forced into position, and the lips 3 arranged at intervals throughout the length of the strip at each of its side edges and adapted to be bent in opposite directions to engage the opposite faces of the wheel, the lips at the beveled edge of the strip being beveled or wedge-shaped, substantially as described.

603,734. BICYCLE-SEAT. ARTHUR B. PECK and CHARLES C. HAWLEY, Minneapolis, Minn.; said Hawley assignor to said Peck. Filed Jan. 14, 1896. Serial No. 575,681. (No model.)

Claim.—1. The combination, in a bicycle-seat, of a rear or main section, with pivoted auxiliary sections, and a pivoted lever provided between said sections and upon the ends of which said sections rest and are freely movable, the depression of either auxiliary section being adapted through the medium of said lever to raise the other auxiliary section, substantially as described.

2. The combination, in a bicycle-seat, of a rear or main section, with the independent reciprocating forward sections forming extensions thereof, and a single pivoted lever forming the reciprocating connection between said parts and whereon said forward sections rest, substantially as and for the purpose specified.

3. The combination, in a bicycle-seat, with a suitable support, of independent sections pivoted thereon, a pivoted lever arranged transversely between said sections and whereon the same rest and are freely movable, substantially as and for the purpose specified.

4. The combination, in a bicycle-seat, of a rear or main section, with the forward hinged or pivoted sections, a pivoted lever, and rolls 25 provided upon said forward sections and bearing upon said lever, substantially as and for the purpose specified.

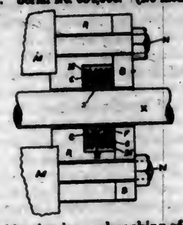
5. The combination, in a bicycle-seat, of the main section, with the independent sections hinged thereto and provided with rolls 25, a stud 17 secured to the main section, a lever 15 pivoted upon said stud and whereon said rolls 25 bear, substantially as described.

6. The combination, in a bicycle-seat, of a main section, with two independent reciprocating sections provided at the forward edge thereof, a centrally-pivoted lever transversely arranged between said sections and upon the ends of which the same bear, and said lever being longitudinally adjustable to relatively raise and lower said independent sections, substantially as described.

7. The combination, with the main section, of the hinged sections, the stud 17 provided upon the main section, a lever 15 pivoted on said stud and whereon said hinged sections rest, and a stop 18 provided on said stud to limit the movement of said lever, substantially as described.

603,735. BICYCLE-SEAT ATTACHMENT. HORATIO A. PORTER, Holyoke, Mass. Filed Mar. 31, 1897. Serial No. 630,127. (No model.)

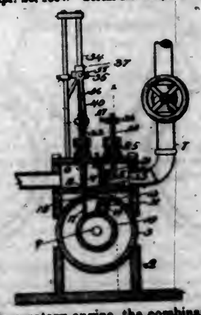
Claim.—1. A seat attachment for a bicycle comprising a vertically-disposed fork member pivoted at its lower end to the rear axle of the bicycle, a horizontally-disposed member rigidly connected to the upper end of the fork member and carrying at its rear end the seat, and ears pivotally connected at their upper ends to the seat-post of the bicycle and at their lower ends to the front end of the horizontally-disposed member, substantially as described.



2. A seat attachment for a bicycle comprising a vertically-disposed fork member pivoted at its lower end to the rear axle, a horizontally-disposed member connected to the upper end of the fork member and carrying at its rear end the seat, said horizontal member consisting of two tubes adjustably connected together, a clamp to lock the two tubes in their adjusted position, and ears pivotally connected at their upper ends to the seat-post of the bicycle and at their lower ends to the front end of the horizontally-disposed member, substantially as described.

3. A seat attachment for a bicycle comprising a horizontally-disposed member pivotally connected at its front end to the seat-post of the bicycle and carrying the seat at its rear end, a short fork rigidly connected to said horizontal member intermediate its ends, tubes pivoted at their lower ends on the outer ends of the driving-wheel axle, tubes hinged at their upper ends to the fork on the horizontal member and their lower ends fitting within the tubes on the driving-wheel axle, springs within the lower tubes to engage the ends of the upper tubes, and a slot-and-pin connection between the upper and lower tubes to permit limited vertical movement between them, substantially as described.

4. A seat attachment for a bicycle comprising a vertically-disposed fork member pivoted at its lower end to the rear axle of the bicycle, a horizontally-disposed member rigidly connected intermediate its ends to the upper end of the vertically-disposed member, a seat supported on the rear end of the horizontal member, said horizontal member consisting of two tubes fitting one within the other,

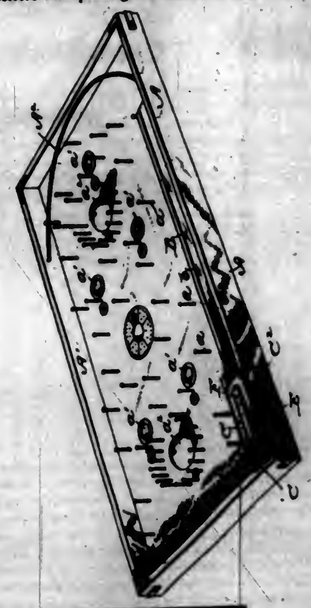


the outer tube being split and provided with a clamping-collar, a collar rigidly connected to the front end of said horizontal member and provided with an upwardly-extending lug, and ears pivotally connected at their upper ends to the bicycle seat-post and at their lower ends to the lug on said collar, substantially as described.

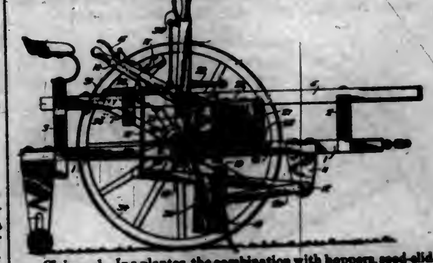
603,736. METALLIC PACKING. WILLIAM H. PRENDERGAST, Savannah, Ga., assignor of one-half to Charles D. Kline, same place. Filed Oct. 12, 1897. Serial No. 654,998. (No model.)

Claim.—The combination in a rod-packing of three sets of rings, all of the same external diameter; one that is simple, divided into three segments and encircled by a spring, which is situated nearest the cylinder; and the other two double, consisting of one larger inclosing ring of one piece of metal with one open joint, encircled by a spring, and a smaller inclosed ring divided into three segments with open joints, the inner ring of one of the double rings having a greater external diameter than the other with all the joints broken inclosed in a casing or gland whose internal diameter is greater than external diameter of the rings substantially as specified.

603,737. ROTARY ENGINE. FRANK PRESSLEY, Sioux Rapids, Iowa. Filed Apr. 26, 1897. Serial No. 633,970. (No model.)



Claim.—1. In a rotary engine, the combination, with a concentrically-located piston provided with a wing, of a gate provided with a head, two vertical rods, the head of the gate engaging with one of said rods, a collar adjustably secured upon each of said rods, a spring on one of the rods between the collar and the head of the gate, a sleeve on the rod, a latch pivotally secured to the sleeve one part of which is provided with a catch and is adapted to engage with the head of the gate, and another part is adapted to engage with the collar on the other rod, and means for moving the sleeve, substantially as set forth.



2. In a rotary engine, the combination, with a cylinder, of a piston journaled concentrically therein, a steam-chest, a partition therein provided with ports, a valve for the ports provided with a longitudinal slot, a stem, the lower end of which is provided with a cross-head that fits within the slot, a guide-post, a head adjustably secured to the top of the stem and provided with a sleeve to fit upon the guide-post, and an eccentric connected with the head, substantially as set forth.

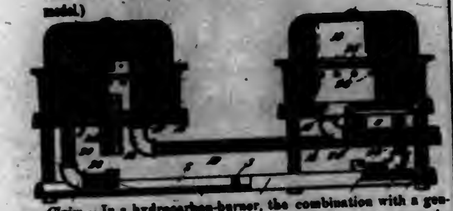
603,738. BAGATELLE-BOARD. MONTAGUE REDGRAVE, Jersey City, N. J. Filed Nov. 12, 1897. Serial No. 658,370. (No model.)

Claim.—In combination with the bagatelle-board, A, having the wall, *b*, parallel with one side so as to leave an alley, B, between them, a plate, C, covering the rear or lower end of the said alley at the lower right-hand corner of the board and provided with a depressed part, C^3, having a longitudinal slot, C′, a plunger, D, arranged in the said alley under the said plate and a spring behind the said plunger, the said plunger being provided with a knob which slides in the said depressed part of the plate, the top of the said knob being flush with the higher part of the plate and practically with the rim, that there may be no part appreciably above or in any way outside of the said rim to interfere with packing the boards together, substantially as set forth.

603,739. CORN-PLANTER. HARRISON REES, Farmington, Iowa. Filed Dec. 9, 1897. Serial No. 661,260. (No model.)

Claim.—1. In a planter, the combination with hoppers, seed-slides for the hoppers, a bar connecting the seed-slides, and an axle provided with tappets for actuating the said bar and the slides connected therewith, of grain-spouts, means for adjusting the grain-spouts vertically, flap-valves applied to and carried by the grain-spouts and having vertical extensions to come in contact with the aforesaid bar connecting the seed-slides, and means positively and loosely connecting the vertical extensions of the flap-valves with the said bar, substantially as and for the purpose set forth.

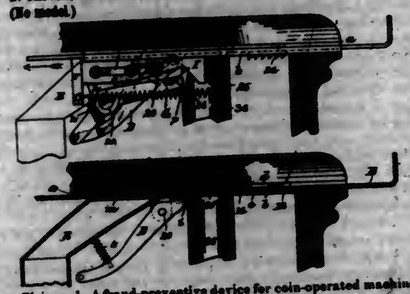
2. In a planter, the combination with a hopper, a seed-slide, a spring for moving the seed-slide rearwardly, and an axle or rotating part provided with tappets for operating or moving the seed-slide in opposition to its actuating-spring, of a grain-spout, means for adjusting the grain-spout vertically, a flap-valve applied to the grain-spout and having a vertical extension slotted at its upper end, and a headed fastening connecting the slotted extension of the flap-valve with the seed-slide, substantially as and for the purpose specified.



3. In a planter, the combination with hoppers alining transversely, seed-slides for the hoppers, a bar connecting the seed-slides, springs connected to the hoppers and having their rear ends bent and engaging with the seed-slide-connecting bar, and pins or stops projecting from the seed-slide-connecting bar and operating in slots of the frame to limit the rearward movement of said bar and the seed-slides connected therewith, of an axle or rotating part provided with tappets to engage with the seed-slide-connecting bar, grain-spouts, means for adjusting the grain-spouts vertically, and flap-valves applied to the grain-spouts and having adjustable connection with the aforesaid seed-slide-connecting bar, substantially as set forth.

4. In a planter, the combination with a hopper, a spring-actuated seed-slide therefor, and means for reciprocating the seed-slide in the direction of motion of the machine, of a lever having a portion projecting across the path of the seed-slide, and means for securing the lever in an adjusted position, whereby the rearward movement of the seed-slide is limited, substantially as set forth.

5. In a planter, the combination of transversely-alining hoppers, seed-slides therefor, a bar connecting the seed-slides, springs normally tending to move the seed-slide-connecting bar rearwardly, a lever having a portion extending across the path of the seed-slide-connecting bar to limit its rearward movement, and means for securing said lever in an adjusted position, substantially as set forth.



6. In a planter, the combination of a hopper, a seed-slide, actuating mechanism therefor, a lever, a hooked rod having connection with the lever, a plate having a series of openings to receive the bent end of the hooked rod, and a hand-latch applied to the lever and having connection with the hooked rod, substantially as and for the purpose described.

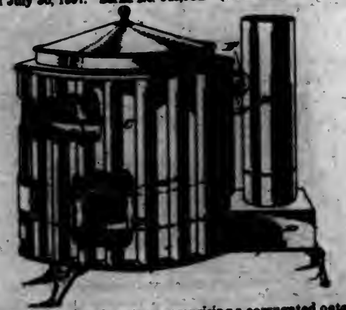
603,740. HYDROCARBON-BURNER. JOHN REINEHAGEN, Marion, Ohio, assignor of one-half to Edward C. Drasher and John T. Monnett, same place. Filed May 17, 1897. Serial No. 636,931. (No model.)

Claim.—In a hydrocarbon-burner, the combination with a generating-chamber and burner, of a commingling-chamber between the burner and the generating-chamber, an external annular spreader on the wall of the commingling-chamber below the generating-chamber, and an independent series of apertures through the wall of the commingling-chamber above and below the spreader, substantially as and for the purpose specified.

603,741. FRAUD-PREVENTING DEVICE FOR COIN-CONTROLLED MACHINES. JOHN G. W. REGANS, Weymouth, and ALBERT D. GROVER, Malden, Mass. Filed Dec. 14, 1897. Serial No. 661,836. (No model.)

Claim.—1. A fraud-preventive device for coin-operated machines or apparatus, comprising a slide having an opening to receive a coin of predetermined size, a spring-pressed feeling-lever arranged to bear against the under surface of said slide and adapted to contact with the coin as the slide is pushed in, and a locking pawl-lever operated by the feeling-lever and adapted to engage the coin-slide to lock the same and arrest its inward movement when the feeling end of the feeling-lever is permitted to rise, substantially as described.

2. In a coin-operated machine or apparatus, the combination with a slide having an opening for the reception of a coin, of a spring-pressed feeling-lever bearing against the under surface of said slide and adapted to contact with the coin as the slide is pushed in, and a locking pawl-lever operated by the feeling-lever and adapted when so operated to engage the coin-slide, said levers being so fulcrumed with respect to each other that a slight inward or upward movement of the feeling end of the feeling-lever will produce a sufficient movement of the pawl-lever to cause it to engage the coin-slide and thereby prevent its further inward movement, substantially as described.



3. In a coin-operated machine or apparatus, the combination with a slide having an opening for the reception of a coin, of a spring-pressed feeling-lever bearing against the under surface of said slide and adapted to contact with the coin as the slide is pushed in, and a locking pawl-lever operated by the feeling-lever and adapted when so operated to engage the coin-slide, said feeling-lever being provided at its feeling end with a sharp-edged antifriction-roll adapted to contact with and cut into any soft substance placed within the coin-opening of the slide, whereby a sufficient movement of the feeling-lever is produced to actuate the pawl-lever and cause it to engage the slide to prevent its further inward movement, substantially as described.

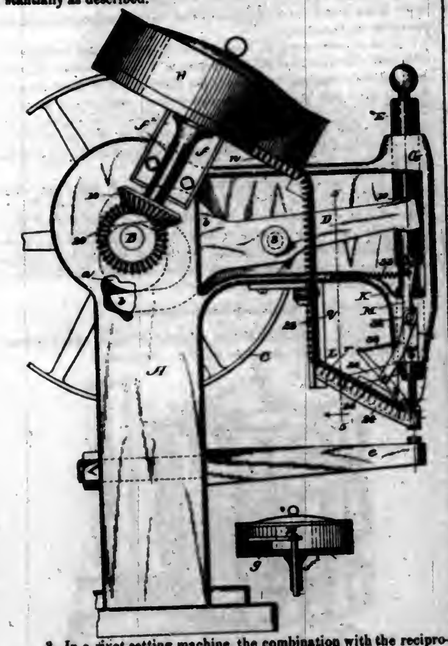
4. In a coin-operated machine or apparatus, the combination with the coin-slide, the spring-pressed feeling-lever and the pawl-lever operated by the said feeling-lever to lock the slide, of a cam-slide operated by the coin-slide when the latter has nearly reached the limit of its inward movement and acting to withdraw the pawl-lever and the feeling-lever out of contact with the coin-slide to relieve the latter of the friction of said levers during its outward movement, substantially as described.

5. In a coin-operated machine or apparatus, the combination with the coin-slide having an opening of slightly-greater diameter than the coin required to operate the machine, of a plate arranged directly over said slide and provided with an aperture of the exact diameter of the proper coin and registering with the coin-opening in the slide when the latter is drawn out, whereby the retention of a coin in the coin-slide after the latter has been pushed in is prevented, substantially as set forth.

6. In a coin-operated machine or apparatus, the combination with a slide having an opening for the reception of a coin, of a plurality of independently-operating spring-pressed feeling-levers bearing against the under surface of said slide and adapted to contact with the coin as the slide is pushed in, and the pawl or slide locking-lever adapted to be actuated by any one of said feeling-levers to lock the slide, substantially as described.

603,742. HEATING-STOVE. ALFRED G. RILEY, Memphis, Tenn. Filed July 30, 1897. Serial No. 646,514. (No model.)

Claim.—1. A heating-stove comprising a corrugated outer cylinder closed at its opposite ends, an inner cylinder open at its upper end and supported in contact with said corrugated cylinder above the lower end thereof, and an outlet-flue communicating with the space below the inner cylinder, substantially as specified.



2. A heating-stove comprising a corrugated outer cylinder closed at its opposite ends, an inner cylinder open at its upper end and supported in contact with said corrugated cylinder above the lower end thereof, and an outlet-flue communicating with the space below the inner cylinder and provided with vertical walls extending beneath the same, substantially as specified.

603,748. RIVET-SETTING MACHINE. LOUIS H. SOMERSEN, Brooklyn, N. Y. Filed Sept. 7, 1897. Serial No. 650,956. (No model.)

Claim.—1. In a rivet-setting machine, the combination with the reciprocating plunger-bar carrying the punch and provided with a sleeve sliding thereon and encircling its lower end, of a raceway composed of an upper stationary portion and a lower movable inclined portion rigidly connected to the sliding sleeve and located on one side of the stationary portion, said two portions of the raceway being each provided with a covering-plate overlapping the rivet slot or track therein, and the covering-plate of the lower inclined portion being bent at an angle and extending upward beyond the lower end of the covering-plate of the upper portion to overlie the lower portion of its track or slot on the descent of the lower portion of the raceway, substantially as described.

2. In a rivet-setting machine, the combination with the recipro-

cating plunger-bar carrying the punch and provided with a sleeve sliding thereon, and encircling its lower end and a raceway composed of an upper stationary portion and a lower inclined portion moving thereon, and rigidly connected to the sliding sleeve and provided at its lower end with an aperture for the passage of the punch and rivet driven thereby, of a lever pivoted to the sleeve and actuated in one direction by a spring and in the opposite direction by a roll or projection on the plunger-bar, a spring-actuated escapement-finger pivoted to said lever and provided with a pointed or beveled lower end adapted to pass between the two lowermost rivets in the raceway, a guide cam or incline on the cover of the lower portion of the raceway and a roll on the escapement-finger held in contact with said cam by the spring connected therewith, whereby as the plunger-bar is reciprocated the escapement-finger is guided as it is moved up and down to cause it to enter between the rivets and hold the lower rivet with a spring-pressure against the punch as the latter ascends, substantially as described.

3. In a rivet-setting machine, the combination with the reciprocating plunger-bar and punch and a raceway having an aperture at its lower end for the passage of the punch and rivet driven thereby, of a spring-actuated pivoted escapement-finger having a narrow pointed lower end adapted to enter the slot at the lower end of the raceway and pass between the two lowermost rivets and hold the lower rivet with a spring-pressure against the punch while the latter is rising within the aperture at the bottom of the raceway, the point of the escapement-finger while passing between the two rivets serving to force back the line of rivets in the raceway and after carrying the lower rivet into position beneath the punch, bearing against the side of the latter on its descent above the rivet to prevent undue pressure of the finger thereon, substantially as described.

608,744. FAUCET. ELIJAH U. SCOVILLE, Manlius, N. Y. Filed Jan. 21, 1897. Serial No. 620,017. (No model.)

Claim.—1. The combination of the faucet-body *a* formed with a valve-seat in its receiving portion *a'* and with screw-threads on the exterior of said portion, the outwardly-opening valve *e*, the coupling *c* provided with an internally screw-threaded portion and connected thereby to said body portion and provided in its interior with shoulders *f* and *f'*, the packing-ring *g* interposed between the shoulder *f* and end of the body portion *a'*, the spring *e* interposed between the shoulder *f'* and exterior of the valve and a manipulative valve-opener connected to the faucet and forcing the valve outward from its seat as set forth.

2. The improved faucet consisting of the body *a*, having the inlet portion *a'* provided with the inwardly-tapering valve-seat *b* and with the shoulder *b* and screw-threads on the exterior, the coupling *c* provided with screw-threads *d'* and shoulders *f f'*, the outwardly-opening valve *e*, the packing *g*, spring *e*, the shaft *c* journaled in the faucet-body at right angles to the inlet, and the lever *d* and handle *h* attached to said shaft substantially as set forth and shown.

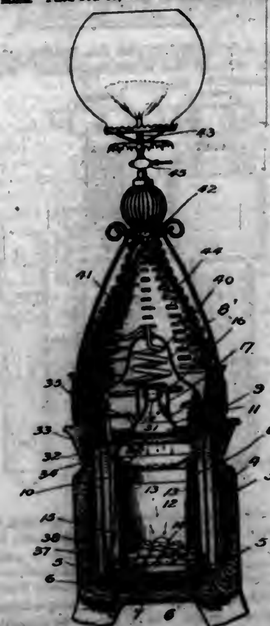
608,745. UNDERGROUND CONDUIT FOR ELECTRIC CONDUCTORS. CHARLES H. SEWALL, Chicago, Ill. Filed May 5, 1896. Serial No. 542,613. (No model.)

Claim.—1. As a conduit for electrical conductors a plurality of inverted channels made in separate and single sections, said sections resting upon a flat foundation-floor, which, with the inverted channels, form duct-openings; and the said channels supporting other floors each one sustaining its complement of inverted channels whereby the conduit can be made of any width or height and contain any number of ducts.

2. A conduit for drawing in and drawing out electrical conductors consisting of an inverted channel made in sections laid end to end and resting upon a flat floor which forms the lower side of said duct, the said floor being composed of a material plastic when first made but setting to hardness, plastic setting material being also used to form supporting sides and a covering-top whereby the floor, sides and top become an integral support for the sectional channel which serves to hold it rigidly in position.

3. A conduit for electrical conductors consisting of a foundation having a floor formed on the surface thereof, and an inverted channel-section superimposed upon said floor which completes the duct, said channel being composed of material plastic when first made but which sets to hardness and an open frame or binder incorporated into the material of said inverted section and conforming to the shape of the inner wall thereof, substantially as described.

4. A conduit for electrical conductors consisting of a smooth flat floor of indefinite width upon which are placed side by side a plurality of ducts, each duct being formed by superimposing upon said floor inverted channels in sections placed end to end, the said sections of each duct being rigidly and permanently joined at their ends as well as with the sections of other ducts at their sides whereby the whole structure is bonded together.



5. As a conduit for electrical conductors the section G laid end to end upon a flat floor and joined at ends by bridges F; the sections G, bridges F and floor being all joined by a setting cement whereby the metallic frameworks *g* are anchored and caused to contribute tensile strength to the structure as a whole.

6. A conduit-duct for electrical conductors consisting of a smooth flat floor of indefinite length, said floor being a composite made by embedding a metallic frame in cement, concrete or other like plastic material whereby the concrete acts as a resistance to compressive strain and the iron wires as resistance to tensile strain; and upon which are superimposed in sections inverted channels placed end to end.

7. In an underground conduit, the combination with a foundation of concrete, or similar material, having a floor formed on the surface thereof, of an inverted channel resting upon said floor whereby the floor forms the bottom of the conduit, and a body of concrete, or similar material, inclosing and surrounding said inverted channel and formed integral with the concrete constituting the foundation, substantially as described.

8. In an underground conduit, the combination with a foundation of concrete, or similar material, having a floor formed on the surface thereof, of an inverted channel placed upon said floor so that the floor forms the bottom of the conduit, a body of concrete, or similar material, inclosing and surrounding said inverted channel and formed integral with the concrete constituting the foundation, said second body of concrete having a floor formed on the surface thereof, a second inverted channel resting thereon, and a third body of concrete, or similar material, inclosing and surrounding said second inverted channel and formed integral with said second body of concrete, substantially as described.

608,746. ACETYLENE-GAS LAMP. OLIVER G. SEWARD, Minneapolis, Minn. Filed Oct. 15, 1896. Serial No. 608,994. (No model.)

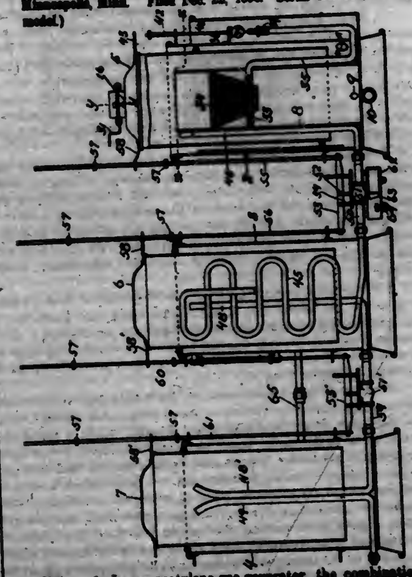
Claim.—1. In an acetylene-gas lamp, the combination, with a water-tank, of a carbid holder or cartridge to be submerged in the water in said tank, a valve in the upper part of said holder or cartridge and through which water is admitted from the tank to the interior of the holder or cartridge, a suitable chamber above the surface of the water in said tank, and into which the gas from the holder or cartridge is conducted therefrom, and automatic means actuated by the pressure of gas to open and close said valve, substantially as described.

2. In an acetylene-gas lamp, the combination, with a water tank or receptacle, of a carbid holder or cartridge arranged in said tank to be submerged by the water therein, and having a water-inlet opening whereby water is admitted to the holder from said tank, a valve for said inlet-opening, said holder having a port or gas-outlet projecting above the surface of the water in the tank, a movable gas-holder arranged in said tank and inclosing said holder and into which the gas from the latter is delivered, and means in connection with said gas-holder for operating the valve at the said inlet-opening to regulate the flow of water into the holder or cartridge, in accordance with the quantity of gas in the gas-holder, substantially as described.

3. In an acetylene-gas lamp or generator, the combination, with the water-tank, of a carbid-holder, a gas-holder arranged in said water-tank to rise and fall therein, the gas being held in the upper part of said gas-holder, a gas or burner pipe arranged above said gas-holder and a condenser arranged in the upper part of said gas-holder and carried thereby, the gas having to pass through said condenser to escape from the gas-holder and enter said pipe, and said condenser being so arranged that the liquid of condensation flows downwardly therein, substantially as described.

4. In an acetylene-gas lamp, a body comprising a lower base portion and an upper part, said upper part bearing a burner and said lower part provided with a water tank or receptacle and with a carbid-holder, a gas-holder in said tank to rise and fall therein and in the upper part of the body, and a detachable connection between said gas-holder and said burner, substantially as described.

5. In an acetylene-gas lamp or generator, the combination, with the water-tank or carbid-holder, of a cartridge provided in the said tank, means for locking the same therein, said holder or cartridge being submerged by the water in said tank and having an opening to admit water from the tank, a valve-lever, a movable gas-holder to actuate said lever, and a gas-outlet from said carbid holder or cartridge substantially as described.



6. In an acetylene-gas lamp or generator, the combination, with a carbid-holder or tank surrounded or submerged by water and whereby it is kept cool, means for supplying water to the interior of said holder or cartridge, a gas-chamber into which the gas is delivered from said holder or cartridge, and the downwardly or backwardly turned deflector 17 arranged at the gas-outlet of the said holder and in the said chamber, and by which the moisture in the gas is caught and condensed, substantially as described.

7. In an acetylene-gas lamp, the combination, with a water-containing tank, of a stationary generator or cartridge almost submerged therein and removable therefrom, a gas-containing chamber or portion, said cartridge comprising upper and lower parts, making a water-tight joint between them, a basket provided in the lower part, said upper part having gas-outlet openings and a deflector surrounding the same, said upper part also provided with a water-inlet opening, and a valve therefor, and means for distributing the water entering said opening, substantially as described.

8. The combination, with a suitable base, of an upper removable part carrying a burner, a water-tank provided in the lower part, a stationary cartridge or generator almost submerged therein, a movable gas-holder, means for regulating the flow of water from the tank into said generator, and a flexible connection from said gas-holder to the burner-pipe, said connection, the gas-holder and the generator being readily accessible upon the removal of said upper part of the base or body of the lamp, substantially as described.

9. The gas-generator inclosed in a suitable chamber or holder and comprising the lower portion 8 to contain the gas-producing material, the upper portion secured upon the top of said portion 8 and provided with the spreading or distributing diaphragm and with the perforated neck or top, means for admitting water above said diaphragm, and the downwardly-turned deflector 17 arranged upon said top or neck and whereby moisture in the gas is condensed, substantially as described.

608,747. ACETYLENE-GAS GENERATOR. OLIVER G. SEWARD, Minneapolis, Minn. Filed Dec. 22, 1896. Serial No. 616,627. (No model.)

Claim.—1. In an acetylene-gas generator, the combination, of an annular water-chamber surrounding a chamber or space for gas-producing material, with an independent movable gas-holder adapted to rise and fall in said water-chamber, means in the top of said movable gas-holder for dropping gas-producing material into the chamber or space therefor without the escape of gas from the gas-holder, an inlet for water from the water-chamber to said space containing

the gas-producing material, and automatic means governed by the production of gas for regulating the entrance of water from the water-chamber to the chamber or space containing the gas-producing material, substantially as described.

2. In an acetylene-gas chamber the combination of an open-topped chamber for calcium carbid with a water-tank surrounding the same, a movable gas-holder in said tank and inclosing said chamber, a water-pipe communicating between said tank and said chamber to admit water from one to the other, a valve in said pipe, a float-lever whereby said valve is normally closed, and means whereby upon the fall of said holder said valve is opened, substantially as described.

3. The combination with the top of a gas-generator, of an open-sided cylinder revoluble therein, a casing or dome therefor and means on the exterior thereof to revolve said cylinder, to expose its open side to the interior or exterior of the gas-generator, and a top for said dome conforming to said cylinder, means for binding the same thereon, and suitable packing interposed between the cylinder and the parts of the dome, substantially as described.

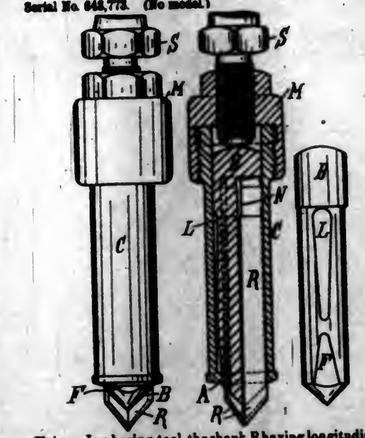
4. In an acetylene-gas generator the combination of a suitable water-tank, with a chamber or space for calcium carbid, therein and surrounded thereby but having an open top, and an independent movable gas-holder, a water-pipe leading from said tank into said chamber or space, an exterior water-pocket, a float-valve provided therein, to control the entrance of water to said chamber or space, a float-rod and a lug upon said gas-holder to engage the same upon the fall of the gas-holder, whereby said valve is opened, substantially as described.

5. In an acetylene-gas generator, the combination, of a suitable tank, with a chamber or space for carbid arranged within said tank and having an open top which projects above the surface of the water in the tank, a gas holder arranged in said tank to rise and fall therein and surrounding or covering said chamber or space to receive the gas therefrom, regulable means for jetting water into the upper part of said chamber or space and upon the material therein, a clean-out hole at the bottom of said chamber or space, a valve or slide to close the same, and a flush-pipe leading into the lower part of said chamber or space, substantially as described.

6. In an acetylene-gas generator, the combination of a water-tank and a gas-holder, with a carbid-holder and means for supplying water thereto, an independent tank and gas-holder, provided with a suitable condenser, a gas-pipe communicating between the first-mentioned gas-holder and the said condenser, a gas-valve provided in said pipe, and means in connection with each gas-holder for automatically opening and closing said valve, substantially as described.

7. In an acetylene-gas generator, the combination with a suitable tank and gas-holder, provided with means for holding and dampening calcium carbid, of an independent tank and gas-holder, a gas-pipe forming a connection between the two gas-holders, a valve in said pipe, a valve-lever, upright rods, connected therewith, suitable guides for said rods, and means whereby the extreme movements of either of said gas-holders will actuate said rods and said valves, substantially as described.

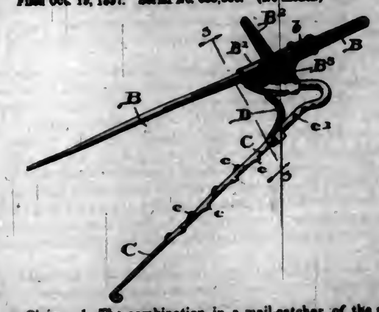
8. In an acetylene-gas generator, the combination with a suitable tank and gas-holder, provided with means for holding and dampening calcium carbid, of an independent tank and gas-holder, a gas-pipe forming a connection between the two gas-holders, a valve in said gas-pipe, means whereby the extreme movements of said gas-holders operate said valve, and condensation-pockets connected with said gas-pipe, on opposite sides of said valve, substantially as described.



9. In an acetylene gas generator, the combination with a water-tank and a gas-holder, of a separate water-tank, and gas-holder, a gas-pipe forming a communication between said gas-holders, a valve therein, a valve-lever, rods having guides, and also having stops to be engaged and operated by said gas-holders, to actuate said valve, substantially as described.

10. In an acetylene-gas generator, the combination with a water-tank and a gas-holder, of means for introducing calcium carbid, without the escape of gas from said holder, a carbid-holder, a water pipe and valve, to supply water to the carbid in said holder, means operated by said gas-holder to open said valve, a second tank and gas-holder, a gas-pipe, leading between the two gas-holders, a valve in said pipe, means whereby the extreme movement of either of said gas-holders, actuates said valve, in the gas-pipe, a third tank and gas-holder, a gas-pipe connecting the second and third gas-holders, a valve in said pipes, means whereby the extreme movements of either the second or the third gas-holder actuate said valve, and a gas-outlet from the third gas-holder, substantially as described.

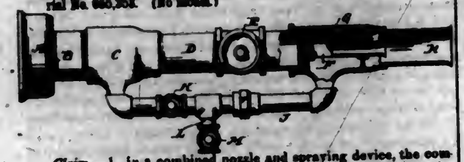
11. In an acetylene-gas generator, the combination, with the water-tank 2, of the interior open-topped chamber 8 arranged therein, the gas-holder 5 to rise and fall in the tank, the water-pipe 35 leading from the tank into said chamber 8, the coil of said pipe within the upper part of said chamber 8, the valve for controlling the flow of water through said pipe, means whereby said valve is operated by said gas-holder, and the projection 34 arranged in the chamber 8 to prevent the lodging of material upon said coil or the stoppage of the openings therein, and means whereby said chamber 8 may be cleaned from the bottom, substantially as described.



12. In combination with the carbid receptacle or holder of an acetylene-gas generator, the pipe 10 leading from the bottom thereof, and having an opening 11 through the bottom of said receptacle, the gas and water tight cap, 14, for the outer end of said pipe, the slidable tube, 12, arranged in said pipe to close said opening 11, and rod or handle, 13, whereby said tube may be drawn out of the pipe, when the cap 14 is removed, as and for the purpose specified.

608,748. TOOL-HOLDER FOR BORING AND SHAPING MACHINES. WILLIAM TRAU, Gundenfeld, Germany. Filed Aug. 19, 1897. Serial No. 648,773. (No model.)

Claim.—In a boring-tool, the shank B having longitudinal grooves communicating with each other to form elastic sides, the cutters in said grooves, the casing C having the bearings or guides A at the end the said shank B having the tapered guide-surfaces F engaging the guides A, and having also the weak casing-faces L extending longitudinally of the shank B, the said casing being substantially cylindrical and the said guides A being formed by inwardly-extending projections at the end of the cylinder, substantially as described.



608,749. MAIL-CATCHER. JAMES R. WHITE, Indianapolis, Ind., assignor of one-half to George C. Hitz and Harry S. How, same place. Filed Oct. 19, 1897. Serial No. 655,008. (No model.)

Claim.—1. The combination in a mail-catcher, of the shaft B, the handle, the catcher-arm C mounted in a suitable hub thereon and formed with a bend or elbow at its extremity, and a spring-strip secured rigidly on one side of said elbow and extending across and loosely connected to the member on the opposite side, whereby it is adapted to receive the impact of the mail-sacks and prevent them from being jammed in said elbow, substantially as set forth.

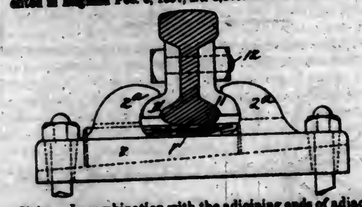
2. The combination, in a mail-catcher, of the shaft, the handle, the catcher-arm mounted in a suitable hub on said shaft, being formed with a bend or elbow at its extremity, and the spring-strip D secured rigidly to one part on one side of the bend a distance from its extreme point and extending across and formed with ears on its other end which embrace the other part of said arm and are adapted to slide thereon, the outer member of said arm being formed with a series of protuberances throughout its length which incline on their outside faces and have abrupt faces adjacent to the elbow, substantially as set forth.

608,750. COMBINED HOSE-PIPE NOZZLE AND SPRAYING DEVICE. WILLIAM P. WILSON, Trenton, N. J. Filed Oct. 15, 1897. Serial No. 655,358. (No model.)

Claim.—1. In a combined nozzle and spraying device, the combination with a pipe-section, of a main delivery-pipe, an injecting-nozzle at the end thereof, a coupling surrounding the injector-nozzle, a by-pass extending from the pipe to the coupling, valves for controlling the by-pass and delivery-pipe, and a removable discharge end on the coupling, substantially as described.

2. In combination with a pipe-section, of a delivery-section leading therefrom of smaller diameter, an injector at the end of the delivery-section, a by-pass extending from the pipe-section to a point adjacent to the injector, a casing for the injector into which the by-pass leads, an air-inlet for the by-pass, a removable discharge end in advance of the injector, and a valve for controlling the air-inlet, by-pass, and the main delivery-section, substantially as described.

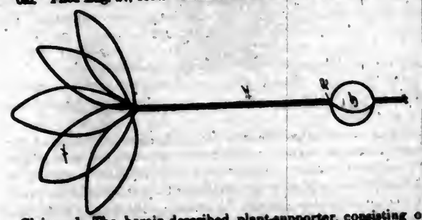
608,751. CHARGING-BUGGY. WILLIAM B. WOODS and LYMAN HENRY, Bridgeport, Ohio. Filed Sept. 2, 1897. Serial No. 650,413. (No model.)



Claim.—1. A charging-buggy for annealing-furnaces, consisting of a traveling truck-frame, a box-support hinged to the main frame at a point in advance of the front truck said support having a rearwardly-extending handle, and mechanism held on the truck-frame for elevating and lowering the handle as specified.

2. A charging-buggy comprising a main frame having trucks at the front and rear end, a box-support hinged to the main frame at a point in advance of the front truck, said support consisting of forwardly-extending horns, and a rearwardly-extending portion projected over the main frame and terminating in a handle, and devices for raising and lowering the handle all being arranged substantially as shown and described.

3. A charging-buggy for annealing-furnaces, consisting of a frame substantially of a length equal to the depth of the furnace, having supporting-trucks, said frame having horns projected forwardly beyond the front truck, hinged to the main frame, said horns merging into a handle-bar extended over the main frame to the rear end thereof, and elevating and lowering devices mounted on the rear end of such frame connected with the end of the handle-bar, and means for moving the buggy in and out of the furnace as shown and for the purposes set forth.



4. In a machine for the purposes described, the combination with the main or trunk frame, the hinged horns and the handle-bar, of the standard at the rear end, a support for the rear end of the handle held to slide on such standard, and hand-operated gear mechanism for raising and lowering such support all being arranged substantially as shown and for the purposes described.

608,752. RAIL-JOINT. SAMUEL YOUNG, Pool Green Patriercft, England. Filed Sept. 21, 1897. Serial No. 652,479. (No model.) Patented in England Feb. 6, 1897, No. 3,175.

operating-cords having one end secured to the said bar and the opposite ends passed over pulleys on the gate-posts and secured to the gate to permit the latter to be opened from either side of the gateway, a ball-shaped catch device pivoted to the inclined track-terminals and adapted to engage the latch-hook to hold the gate open, and releasing-cords passed over pulleys on the cross-bar and through the loop or eye of the said standard or bracket and secured to the said pivoted ball-shaped catch, whereby the said catch may be released from engagement with the latch-hook to permit the gate to close by its own gravity, substantially as described.

608,754. PLANT-SUPPORT. CLARA I. BALDWIN, National City, Cal. Filed Aug. 27, 1897. Serial No. 649,749. (No model.)

Claim.—1. The herein-described plant-supporter, consisting of wires twisted together to form an upright stem, an ornamental top to said stem formed by bending the wires into loops or rings, and an anchoring device at the lower end of said stem formed by bending or deflecting the wires in opposite directions and bringing the same together and again uniting them, substantially as described.

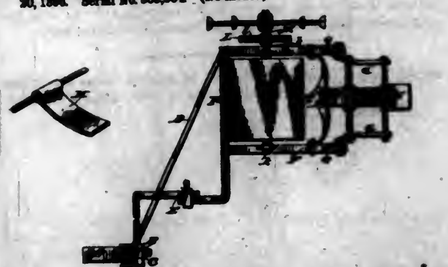
2. A plant-support, consisting of wires twisted together to form a stem, an ornamental top formed by bending the wires into loops, rings, &c., and an anchor formed by deflecting or bending the wires at the base of the stem in various directions, substantially as described.

608,755. BROWN SULFUR DYE. ROBERT DENUTE, New York, N. Y., assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed Oct. 16, 1896. Serial No. 609,162. (Specimens.) Patented in Italy Jan. 13, 1896, XXXI, 40,694, LXXIX, 407, and in France Jan. 15, 1896, No. 253,213.

Claim.—1. The process of producing a new coloring-matter in the form of alkaline salts capable of dyeing vegetable fiber or fabrics at ordinary temperatures fast brown shades, which process consists in subjecting cresols and sulfur in strong alkaline liquid to temperatures above 200° centigrade, substantially as described.

2. As a new article of manufacture the brown coloring-matter producible from cresols and sulfur in alkaline solution at temperatures above 200° centigrade, being in the form of its alkaline salts a black mass easily soluble in water with a greenish-black or bluish-black color capable of dyeing cotton fabrics at ordinary temperatures fast brown shades, and having when precipitated with acids, the characteristics of a brownish-black powder insoluble in water, sodium carbonate, ammonia, and alcohol, soluble with difficulty in dilute soda-lye at ordinary temperature, more easily soluble in hot soda-lye with a greenish-brown color, insoluble or soluble with difficulty in concentrated sulfuric acid (66° Baumé), easily soluble with a greenish-brown color in alkaline sulfids, thus affording solutions which dye cotton at ordinary temperatures in fast brown shades substantially as described.

608,756. INVALID-REST. JESSIE DRAWE, Marine City, Mich., assignor of three-fifths to John Drawe and William Perren, same place. Filed Aug. 7, 1897. Serial No. 647,445. (No model.)

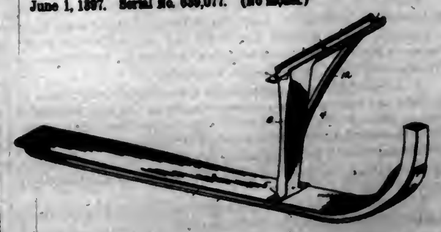


Claim.—1. In an invalid-rest, comprising a bottom frame 1, a rest-frame 3, of greater width than the bottom frame, means for supporting such frame at different inclines, side arms vertically adjusted to the said rest-frame, and a wire bail having portions extended through the meeting ends of the rest and the bottom frame and having vertical members adapted to form supports, of the side arms and a food-rest held upon such side arms, all being arranged substantially as shown and for the purposes described.

2. The combination with the bottom frame 1, having rack members 2, at the inner edges thereof, the hinge-frame of a greater width than the bottom 1, having side members adapted to close down over the sides and end of the bottom member, said side members having vertical slots, and the bail 5 hinged to the frame to engage the racks 2 of the side arms 9 having their inner ends connected to the rest-frame provided with racks on their under faces and eyes or loops, a wire bail having portions extended through the meeting ends of the bottom and rest frame to form hinges therefor, and having vertical members to engage the racks of the side arms 9, and a food-rest consisting of a cross member adapted to rest upon the said side arms 9, and having wire side extensions to fit the loops on such arms 9, all being arranged substantially as shown and for the purposes described.

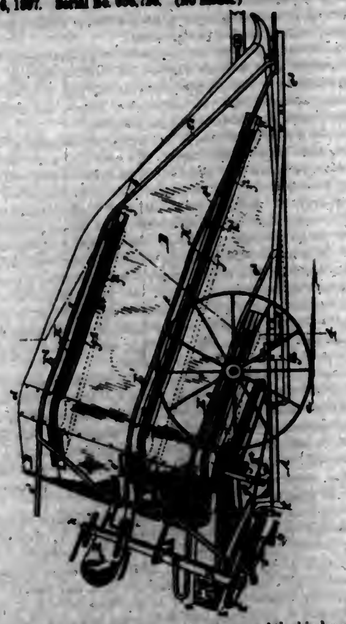
3. An invalid-rest, comprising a bottom frame 1, having racks 2, a rest-frame 3 of greater width than the bottom frame hinged to such bottom frame and held spaced apart therefrom, means for holding such rest-frame to its different inclines, a cross-bail 11 having portions extended through the bottom and the rest frame to form hinged members therefor, and vertical members, arms 9 vertically adjustable on and connected to the rest-frame and sides, and a food-supporting table adapted to be supported longitudinally on such arms 9, all being arranged substantially as shown and described.

608,757. PLANTER. JOHN L. DURHAM, Seneo, Tex. Filed Aug. 20, 1896. Serial No. 603,364. (No model.)



Claim.—1. The combination with the plow-stock, of a bearing, a vertical standard rising therefrom, the planter-frame, a flexible brace adjustably connected to said standard and frame, and a right-angled beam reversibly and detachably connected with the planter-beam and stock, substantially as and for the purpose specified.

2. The combination with the planter-frame and the coverer pivoted to the end thereof, of a presser-head detachably hinged to the rear end of said planter-frame, a presser-wheel journaled therein, the hopper with its feed mechanism, the furrow-opener, the screw-regulators for adjusting the same, and the chute connected with said opener, all substantially as herein shown and described.



3. The combination with the planter-frame, the presser-wheel mounted therein, the pivotally-mounted presser-plate in line with said wheel, the opener and the coverer, plates secured to opposite sides of the planter-frame and bent backward and inward behind the opener, all substantially as herein shown and described.

608,758. SLED. WILLIAM S. EVANS, Point Rock, N. Y. Filed June 1, 1897. Serial No. 639,077. (No model.)

Claim.—The combination with a sleigh, of the runners thereof, the metal shoes upon the bottom thereof, the snow-shoes resting on the top of the said runners, and the integral knees of metal, comprising each a standard, a flange at the bottom thereof bolted to the snow-shoe and also to the runner and to the runner-shoe, and a transverse channeled flange at the top of the said standard, and the bracket, all substantially as described.

608,759. GRAIN-HARVESTER. GEORGE A. FARRALL, Batavia, N. Y., assignor to the Johnston Harvester Company, same place. Filed Nov. 16, 1897. Serial No. 658,736. (No model.)

Claim.—1. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, and a longitudinal conveyer which moves the grain along the inclined face of the platform, substantially as set forth.

2. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, a binder-deck extending stubbleward from the rear end of the platform, and a longitudinal conveyer which moves the grain along the bearing-faces of the platform and binder-deck, substantially as set forth.

3. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, and a binder-deck extending stubbleward from the rear end of the platform and inclining forwardly, the inclination of the platform and binder-deck being at the same angle, substantially as set forth.

4. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, a binder-deck which extends stubbleward from the rear end of the platform, and conveying-belts running rearwardly along the bearing-face of the platform, thence stubbleward along the bearing-face of the deck and thence forwardly to the front end of the platform, substantially as set forth.

5. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, a binder-deck extending stubbleward from the rear end of the platform and inclining forwardly, conveyer-belts passing lengthwise of the platform and binder-deck and supported on wheels or rollers, and needle and knotter shafts arranged adjacent to the binder-deck, said platform and binder-deck, the pivots of the conveyer-wheels, and the needle and knotter shafts being arranged at the same angle, substantially as set forth.

6. The combination with the cutter and the binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, and a vertically-adjustable bottom arranged along the lower portion of the platform and adapted to support the butts of the stalks, substantially as set forth.

7. The combination with the cutter and binder mechanism, of a platform arranged lengthwise with reference to the line of draft and upright but inclining toward the stubbleward side, so that its bearing-surface faces grainward and upward, a binder-deck which extends stubbleward from the rear end of the platform, belt conveyers which run rearwardly along the bearing-face of the platform, thence stubbleward along the bearing-face of the deck and thence forwardly to the front end of the platform, and guide-bars which are arranged grainward opposite the belt conveyers, substantially as set forth.

8. The combination with the upright longitudinal platform, the upright binder-deck extending stubbleward from the rear end of the platform and the binder mechanism, of a conveyer-belt arranged lengthwise of the platform and binder-deck and provided with teeth which are pivoted to the conveyer-belt to fold back on the same when unsupported, a tooth-supporting guide arranged in the binder-deck and extending stubbleward from the junction of the platform and binder-deck, said guide being pivoted at its front end and capable of swinging forwardly at its rear end, and connections between said guide and the binder mechanism whereby the guide is swung forwardly to release the teeth when they are not required to feed, substantially as set forth.

9. The combination with the upright longitudinal platform, the upright binder-deck extending stubbleward from the rear end of the platform and the binder mechanism, of a conveyer-belt arranged lengthwise of the platform and binder-deck and provided with teeth which are pivoted to the conveyer-belt to fold back on the same when unsupported, a sprocket-wheel arranged at the junction of the platform and binder-deck and a stubbleward sprocket-wheel arranged in the binder-deck for supporting the rear portion of said conveyer, a tooth-supporting guide pivoted in front of said first-mentioned sprocket and extending toward the stubbleward sprocket-wheel, and connections whereby said guide is shifted from the binder mechanism, substantially as set forth.

10. The combination with the longitudinal platform, the binder-deck extending stubbleward from the rear end of the platform and the binder mechanism, of a conveyer-belt arranged lengthwise of the platform and binder-deck and provided with pivoted feeding-teeth, a rock-shaft arranged near the junction of the platform and binder-deck and provided with a guide-bar adapted to hold the teeth in their operative position in passing along the binder-deck, and a rod attached to an arm on the needle-shaft and having a sliding connection with an arm of said rock-shaft, substantially as set forth.

608,760. SKIRT-SUPPORTER. MARIE GAIR, New York, N. Y. Filed Apr. 21, 1897. Serial No. 633,116. (No model.)

Claim.—The combination of the belt having devices for fastening its overlapping ends together, and a longitudinal slot in one of its ends; with a sliding keeper on the slotted end of the belt formed of a single piece of metal bent to fit around the belt with its ends meeting at one side thereof opposite said slot, the ends of said keeper being bent at right angles so as to enter the slot and thus retain the keeper on the belt and limit its movement thereon, for the purpose and substantially as described.

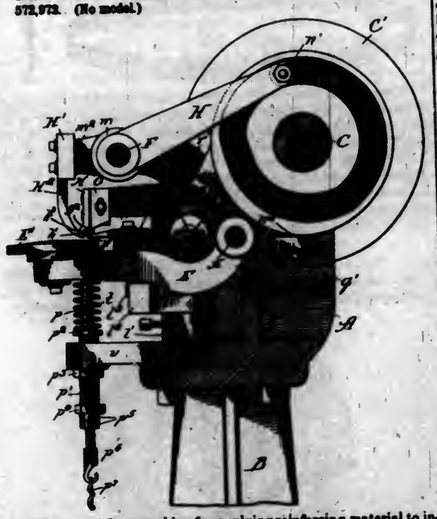
608,761. FLEXIBLE ROTARY WHEEL OR BRUSH. CHARLES H. GRAHAM, Swampscott, Mass., assignor to George H. P. Flagg, trustee, Boston, Mass. Filed Dec. 9, 1897. Serial No. 661,273. (No model.)

Claim.—1. As an article of manufacture, an annular brush composed of radiating strips compressed and glued together at their inner portions and provided with an internal stiffening device, their

outer portions being free and flexible and constituting sections of a yielding rubbing or brushing periphery.

2. An appliance of the character specified, comprising a hub, an annular brush thereon composed of radially-arranged strips rigidly connected at their inner portions to form a continuous rigid annular base, and free at their outer portions, which constitute sections of a yielding rubbing or brushing periphery, and clamping devices on the hub, engaged with the sides of the brush.

603,762. TUBE-CLEANER. SHELTON J. GUNN, Grand Rapids, Mich. Filed Nov. 1, 1897. Serial No. 657,095. (No model.)



Claim.—1. In a tube-cleaner, a motor having spiral buckets, in combination with a shaft, serrated rotary cutter driven by said shaft, pivotal links connecting said cutters with permanent bearings on said shaft, the links at one end of the cutter-heads being closely pivoted both to the bearing and the head and the links at the other end being adjustably connected so that each head is capable of lateral adjustment independent of the others to permit the cutters to adjust themselves to the surface of the tubes, substantially as and for the purpose set forth.

2. In a rotary tube-cleaner, a motor having spiral buckets and a back and peripheral walls to prevent backward or radial escape of water, arms connecting the inner edges of the buckets with the propelling-shaft, a propelling-shaft, rotary serrated cutters connected at one end to said shaft by pivotal links, and the opposite ends connected by pivotal links to an adjustable link so that it may adapt itself to bent tubes, substantially as and for the purpose set forth.

3. In a rotary tube-cleaner, a rotary motor, a shaft propelled by said motor, a series of shafts each supporting a series of independently-rotating cutters, links for pivotally connecting said cutter-shafts to the propeller-shaft, and a jacket open at the front end and having lateral ports at the back end for the free passage of water, substantially as and for the purpose set forth.

603,763. INSOLE-REINFORCING MACHINE. JOHN R. HADAWAY, Brockton, Mass., assignor, by mesne assignments, to the Gem Flexible Insole Company, of Maine. Filed Dec. 23, 1895. Serial No. 572,972. (No model.)

Claim.—1. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a former or anvil to sustain the free edge portion of the reinforcing material on the insole, a beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating said beader or crimper, substantially as described.

2. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a former or anvil to sustain the free edge portion of the reinforcing material on the insole, a beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating said beader or crimper, substantially as described.

3. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a reciprocating beader or crimper having a yoke-shaped head for beading or crimping the reinforcing material upon the insole, and means for actuating said beader or crimper, substantially as described.

4. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a former or anvil to sustain the free edge portion of the reinforcing material on the insole, an oscillatory presser-tool cooperating with said former or anvil, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the reinforcing material, and means for actuating the presser-tool and beader or crimper, substantially as described.

5. In a machine for applying the reinforcing material to insoles, the combination with a work-support, of a vibratory former or anvil to sustain the free edge portion of the reinforcing material on the insole and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating said beader or crimper and former or anvil, substantially as described.

6. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a vibratory former or anvil to sustain the free edge portion of the reinforcing material on the insole, an oscillatory vibrating presser-tool cooperating with said former or anvil to hold and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating the presser-tool and beader or crimper, substantially as described.

7. In a machine for applying reinforcing material to insoles, the combination with a yielding work-support, of a vibratory work-gaging former or anvil to sustain the free edge portion of the reinforcing material on the insole, an oscillatory vibrating presser-tool cooperating with said former or anvil to hold and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating the presser-tool and former or anvil alternately with the beader or crimper, substantially as described.

8. In a machine for applying reinforcing material to insoles, the combination with a yielding work-support, of a vibratory former or anvil to sustain the free edge portion of the reinforcing material on the insole, a gage on said former or anvil in position to bear against the edge of the insole, an oscillatory vibrating presser-tool cooperating with said former or anvil to hold and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating the presser-tool and former or anvil alternately with the beader or crimper, substantially as described.

9. In a machine for applying reinforcing material to insoles, the combination with a yielding work-support, of a vibratory former or anvil to sustain the free edge portion of the reinforcing material on the insole, a gage for guiding the work on its support with relation to the bead formation on the work, an oscillatory vibrating presser-tool cooperating with said former or anvil to hold and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, and means for actuating the presser-tool and former or anvil alternately with the beader or crimper, substantially as described.

10. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a reciprocating beader or crimper having a yoke-shaped head for beading or crimping the reinforcing material upon the insole, a cutter for trimming off the surplus from the edge of said material, and means for actuating said beader or crimper and cutter, substantially as described.

11. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a vibratory former or anvil to sustain the free edge portion of the reinforcing material on the insole, a gage for guiding the work on its support with relation to the bead formation of the work, a lower cutter adjacent to said former or anvil, an oscillatory vibrating pressure tool, cooperating with said former or anvil to hold and feed the work, a reciprocating beader or crimper cooperating with said former or anvil to bead or crimp the said reinforcing material, an upper cutter, and means for actuating the presser-tool and former or anvil alternately with the beader or crimper and upper cutter, substantially as described.

12. In a machine for applying reinforcing material to insoles, the combination with a frame, of a work-support, a rotary drive-shaft carrying cams, a lever I fulcrumed to oscillate horizontally and engaging at one end one of said cams, a former or anvil I' supported on the opposite end of said lever to extend over said work-support, a lever H fulcrumed to oscillate vertically and engaging at one end another of said cams, a presser-tool H³ supported over said work-support and connected with said lever H to oscillate therewith, a lever M fulcrumed to oscillate vertically and engaging at one end another of said cams, a beader or crimper N on the opposite end of said lever M adjacent to said former or anvil I', substantially as described.

13. In a machine for applying reinforcing material to insoles, the combination with the frame, of a work-support, a rotary drive-shaft carrying cams, a lever I fulcrumed to oscillate horizontally and engaging at one end one of said cams, a former or anvil I' supported on the opposite end of said lever to extend over said work-support and having a head A^5, a lever H fulcrumed to oscillate vertically and engaging at one end another of said cams, a presser-tool H³ supported over said work-support and connected with said lever H to oscillate therewith, a lever M fulcrumed to oscillate vertically and engaging at one end another of said cams, a beader or crimper N, having a yoke-shaped head A' and supported on the opposite end of said lever M adjacent to said former or anvil I', substantially as described.

14. In a machine for applying reinforcing material to insoles, the combination with the frame, of a work-support, a rotary drive-shaft carrying cams, a lever I fulcrumed to vibrate horizontally and engaging at one end one of said cams, a former or anvil I' supported on the opposite end of said lever to extend over said work-support, a cutter L adjacent to said former or anvil, a lever H fulcrumed to oscillate vertically and engaging at one end another of said cams, a presser-tool H³ supported over said work-support and connected with the lever H to oscillate therewith, a lever M fulcrumed to oscillate vertically and engaging at one end another of said cams, a beader or crimper N on the opposite end of said lever M adjacent to said former or anvil I', and a cutter O on the lever M, substantially as described.

15. In a machine for applying reinforcing material to insoles, the combination with a frame A, of a work-support F on a spring-controlled frame E, a drive-shaft C carrying a pulley C^5 having formed on one face a cam-groove D, and a cam-drum having formed on its outer faces, respectively, the cam-grooves D' and D^2 and a cam-groove D^3, a longitudinally-reciprocating shaft F, a lever G fulcrumed to engage at one end the cam D, and carrying at its opposite end a cam G^2 in engagement with a roll d' on the shaft F, a lever I fulcrumed to vibrate horizontally and engaging at one end the cam D^3, a former or anvil I' supported on the opposite end of the lever I, a cutter L adjacent to said former or anvil, a lever H fulcrumed to engage at one end the cam D' and carrying at its opposite end a sleeve m surrounding the shaft F, a collar m' surrounding said sleeve and carrying a head H^2 supporting the presser-tool H^3, a lever M fulcrumed to engage at one end the cam D^2, and carrying at its opposite end the beader or crimper N, and a cutter o on said lever M, the whole being constructed and arranged to operate substantially as described.

16. In a machine for applying reinforcing material to insoles, the combination with a work-support, of bead-forming tools and mechanism to actuate said tools to cause them to form a bead or crimp in said reinforcing material, substantially as described.

17. In a machine for applying reinforcing material to insoles, the combination with a work-support, of work-feeding and bead-forming tools, and actuating mechanism therefor, adapted to feed the work and form a bead or crimp in the reinforcing material, substantially as described.

18. In a machine for applying reinforcing material to insoles, the combination with bead-forming mechanism for forming the bead or crimp in the reinforcing material, of edge-trimming mechanism for trimming the edge of said reinforcing material, substantially as described.

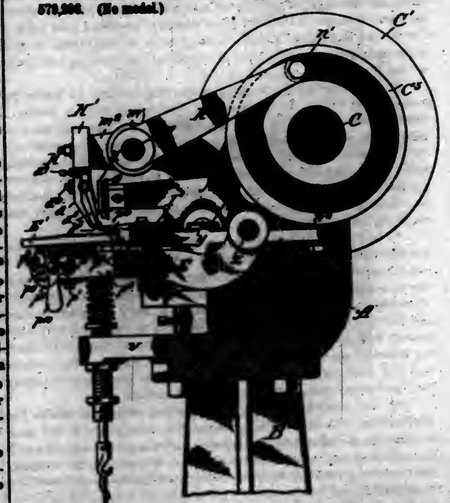
19. In a machine for applying reinforcing material to insoles, the combination with a work-support, of bead-forming mechanism, acting to form a bead or crimp in the reinforcing material, and to secure said reinforcing material to an insole, substantially as described.

20. In a machine for applying reinforcing material to insoles, the combination with a work-support, of bead-forming mechanism, operating automatically to form a bead or crimp in the insole-reinforcing material, substantially as described.

21. In a machine for applying reinforcing material to insoles, mechanism operating automatically to form a bead or crimp in said reinforcing material, and to secure said reinforcing material to an insole, substantially as described.

22. In a machine for applying reinforcing material to insoles, the combination with a vibrating anvil or former arranged to project under the edge of the reinforcing material, of a presser-tool and means to impart a simultaneous lateral movement to the anvil or former and the presser-tool, substantially as described.

23. In a machine for applying reinforcing material to insoles, the combination with an anvil or former and a beading or crimping tool, of a presser-tool, means to move said tool toward and from the work, and means to laterally reciprocate said tool in the direction of the feed of the work, substantially as described.



24. In a machine for applying reinforcing material to insoles, the combination with a beading or crimping tool, of an anvil or former arranged to project beneath the reinforcing material, and to engage and feed the work, and means to actuate said anvil or former, substantially as described.

25. In a machine for applying reinforcing material to insoles, the combination with a beading or crimping tool, of an anvil or former having a bead-molding head and a shoulder to bear against the lip of the insole, substantially as described.

26. In a machine for applying reinforcing material to insoles, the combination with a beading or crimping tool, of an anvil or former having a bead-molding head projected therefrom, substantially as described.

27. In a machine for applying reinforcing material to insoles, the combination with a beading or crimping tool, of an anvil or former having a bead-molding head and a finger projecting laterally from said head, substantially as described.

608,764. INSOLE-REINFORCING MACHINE. JOHN R. HADAWAY, Brockton, Mass., assignor, by mesne assignments, to the Gem Flexible Insole Company, of Maine. Filed Feb. 14, 1898. Serial No. 670,208. (No model.)

Claim.—1. In a machine for applying reinforcing material to insoles, the combination of a rotating work-support having circular and radial grooves crossing each other upon its surface, an anvil or former to sustain the free edge portion of the reinforcing material on the insole, a beading or crimping tool cooperating with said anvil or former to bead or crimp the said reinforcing material, and means for actuating said tool, substantially as described.

2. In a machine for applying reinforcing material to insoles the combination with a work-support, of an anvil or former, an oscillatory presser-tool, and a spring-controlled auxiliary pressing and smoothing tool, cooperating with said anvil or former, a reciprocating beading or crimping tool, also cooperating with said anvil or former to bead or crimp the said reinforcing material, and means for actuating the presser-tool and beading and crimping tools, substantially as described.

3. In a machine for applying reinforcing material to insoles, the combination with a work-support, of an anvil or former, an oscillatory presser-tool having a bent finger, and a spring-controlled auxiliary pressing and smoothing tool pivotally supported on said presser-tool, said presser-tool cooperating with said anvil or former, a reciprocating beading or crimping tool also cooperating with said anvil or former to bead or crimp the said reinforcing material, and means for actuating the presser-tool and beading or crimping tool, substantially as described.

4. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a vibratory anvil or former, an oscillatory presser-tool comprising a bent finger d adjustably secured upon its oscillatory support and carrying a set-screw d^7, an auxiliary pressing and smoothing tool d^3 pivotally supported on a head d^5 carried by a set-screw d^4 in a slot in said presser-tool and a spring d^6 engaging the set-screw d^7, said presser-tool cooperating with said anvil or former, a reciprocating beading or crimping tool cooperating with said anvil or former to bead or crimp the said reinforcing

material, and means for actuating the presser-tool, and beading or crimping tools, substantially as described.

5. In a machine for applying reinforcing material to insoles, the combination with a work-support, a former or anvil, a beading or crimping tool, and a presser-tool to bear against the inner side of the lip on the insole, of a gage device independent of the former or anvil arranged to bear against the edge of the insole, and adjustable to force the insole in opposition to said presser-tool, substantially as and for the purpose set forth.

6. In a machine for applying reinforcing material to insoles, the combination with a work-support and a presser-tool to bear against the inner side of the lip of an insole, of a gage device adjustably supported to bear against the edge of the insole and having an operating-lever for moving it to force the insole in opposition to said presser-tool, and an adjustable abutment for the lever, substantially as and for the purpose set forth.

7. In a machine for applying reinforcing material to insoles, the combination with a work-table on a yielding support, and a presser-tool to bear against the inner side of the lip of an insole, of a gage device P comprising a slide p adjustably confined in a recess in said support and carrying a roller p', and a finger p^4 to extend over said table and bear against the edge of said insole, a plate p^2 for confining said arm in place and having an extension p^3 provided with holes p^5 for the adjustment of a stud p^6 and a lever p^{10} fulcrumed on said plate and having a slotted head p^{11} engaging said roller, substantially as and for the purpose set forth.

8. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a vibratory anvil or former, a lower cutter adjacent to and extended beneath the said anvil or former, an oscillatory vibrating presser-tool coöperating with said anvil or former to hold and feed the work, a beading or crimping tool coöperating with said anvil or former to bead the said reinforcing material, an upper cutter, and means for actuating the beading or crimping tool, upper cutter, presser-tool and anvil or former, substantially as described.

9. In a machine for applying reinforcing material to insoles, the combination with a work-support, of a vibratory anvil or former I' cut out on its under side, a lower cutter L having a head l^3 and supported to extend said head under the said anvil or former, an oscillatory vibrating presser-tool coöperating with said anvil or former to hold and feed the work, a reciprocating beading or crimping tool coöperating with said anvil or former to bead or crimp the said reinforcing material, an upper cutter, and means for actuating the presser-tool and anvil or former alternately with the beading or crimping tool, and upper cutter, substantially as described.

10. In a machine for applying reinforcing material to insoles, the combination with bead-forming mechanism arranged to form a bead or crimp in the reinforcing material, of a presser-tool, and an auxiliary pressing and smoothing tool to press and smooth the reinforcing material to cause it to lie smoothly upon the insole, substantially as described.

11. In a machine for applying reinforcing material to insoles, the combination with an anvil or former and the bead-forming tool, of a presser-tool and an auxiliary pressing and smoothing tool, substantially as described.

12. In a machine for applying reinforcing material to insoles, the combination with an anvil or former and the bead-forming tool, of a presser-tool and a yielding auxiliary pressing and smoothing tool, substantially as described.

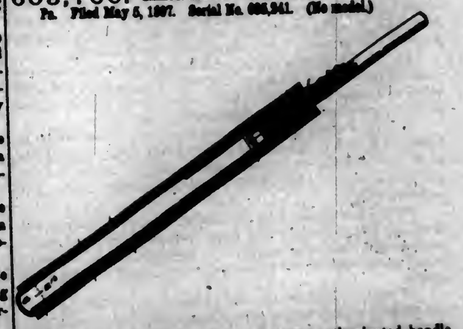
13. In a machine for applying reinforcing material to insoles, the combination with a presser-tool and an anvil or former, of a beading and crimping tool and an auxiliary pressing and smoothing tool carried by the presser-tool, substantially as described.

14. In a machine for applying reinforcing material to insoles, the combination with the bead-forming tool, of a presser-tool, and a pressing and smoothing tool arranged to have a movement toward the work with the presser-tool and a movement across the work independent of said tool, substantially as described.

15. In a machine for applying reinforcing material to insoles, the combination with bead-forming mechanism comprising an anvil or former, adapted to form a bead or crimp in the reinforcing material, of a movable guide or gage to position the work relatively to such anvil or former, substantially as described.

608,765. PHOTOGRAPHIC RETOUCHING-TABLE. WILLIAM H. HARDING, South Framingham, Mass. Filed Dec 6, 1897. Serial No. 660,899. (No model.)

Claim.—1. In a negative-retouching apparatus, a movable frame, as B, means to support it, a mirror pivotally mounted with relation to said frame and a support mounted upon said pivoted frame, said support containing movable slides having notched or cut-away ends and adapted to overlap one the other, the adjustment of said movable slides controlling the light-opening between them, and a hinged screen mounted upon said support, substantially as described.



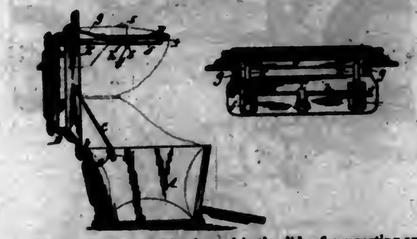
2. A table having an opening cut in its top, a frame pivoted at one end below said top and having pivoted within it a mirror-frame, combined with a support having movable slides adapted by their change of position to make a larger or smaller space as f, and a screen connected with said support, the said frame, support and screen when folded up entering the space in the table and being held concealed in the table-frame with the exception of the screen, substantially as described.

3. A pivoted frame, as B, having a mirror pivotally mounted within it, and a support hinged to said movable frame, and provided with movable slides notched at their edges, as at f', f^3, to leave a space between them, a rest for a negative, a screen, and means to adjust said support into any desired position with relation to said frame and to adjust the screen with relation to said support, substantially as described.

4. In a negative-retouching frame, a support made as a frame having slotted side bars and provided with glass at its center, combined with notched sliding plates overlapping one the other and adapted to be slid transversely in said support to thereby control the size of the space presented between said sliding plates for the passage of light through said support, substantially as described.

608,766. RAZOR-STROP. THOMAS G. HOLLAND, Philadelphia, Pa. Filed May 5, 1897. Serial No. 634,541. (No model.)

Claim.—1. A razor-strop having a permanently-pivoted handle movable laterally and longitudinally of the strop-body, substantially as described.



2. A razor-strop having its body portion provided with a recess, in combination with a permanently-pivoted handle adapted to be moved into engagement with the recess and to be held firmly in place therein by frictional contact with the walls of the recess substantially as described.

3. A razor-strop comprising a back and a front plate each provided with a suitable stropping-surface, cleats secured to the back plate, a handle provided with a slotted plate, and a rivet for holding the back and front plates assembled and passing through the slot of the handle-plate, substantially as and for the purpose specified.

4. A razor-strop comprising a rigid back plate and a resilient front plate, the two plates being provided each with a suitable stropping-surface, one end of the front plate being bent to form a flange by which it is secured to the back plate, a rivet securing the other end of the face-plate and back plate together, cleats secured to the back plate, and a handle provided with a slotted plate, the plate being held against separation from the strop-body by the said rivet, substantially as described.

5. A razor-strop, comprising a front and a back plate, cleats secured to the back plate, a rivet for holding the front and back plates assembled, said rivet being located adjacent to the inner ends of the cleats, thereby leaving a clear space between the cleats and the face-plate, a reinforcing-plate secured to the cleats beneath the face-plate, a handle having a slotted plate held in place by the said rivet, the handle being adapted to be pushed between the cleats, whereby to be held firmly in place for use, substantially as described.

608,767. BURIAL-CASKET. JOSEPH JAEHN and EDWARD HARNY, Buffalo, N. Y. Filed Feb. 16, 1898. Serial No. 670,507. (No model.)

Claim.—1. The combination with the lid, of supporting-arms hinged or pivoted to the under side thereof, a canopy mounted on said arms and capable of sliding on the same toward and from the lid, and a supporting device extending from the projected canopy upwardly to the lid, substantially as set forth.

2. The combination with the lid, of supporting-arms hinged or pivoted to the under side thereof, a canopy mounted on said arms and capable of sliding on the same toward and from the lid, a supporting device extending from the projected canopy upwardly to the lid, and a locking device whereby the canopy is interlocked with the supporting-arms when projected, substantially as set forth.

3. The combination with the lid, of supporting-arms hinged or pivoted to the under side thereof, a canopy provided with slideways in which said arms engage, spring locking-bolts mounted on the canopy and adapted to engage with said arms when the canopy is projected, and a supporting device which extends from the projected canopy upwardly to the lid, substantially as set forth.

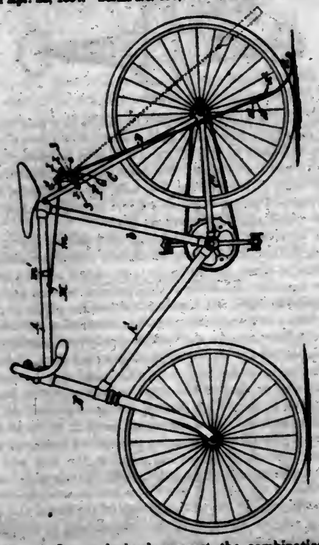
608,768. MOISTENING DEVICE. JULIUS J. KAEMER, Kansas City, Mo. Filed Mar. 5, 1897. Serial No. 626,120. (No model.)

Claim.—1. In a moistening device, the combination with a cushioned pad, of a non-absorbent covering for the pad, and a filamentous device of absorbent material upon the said covering, there being a liquid-supply below the pad with which the filamentous device has communication, substantially as described.

2. In a moistening device, the combination with a cushioned pad, of a non-absorbent covering for the pad, there being a liquid-supply below the pad, and a cloth strip upon the covering and communicating with the liquid-supply, substantially as described.

3. In a moistening device, the combination with a suitable receptacle adapted to contain a liquid-supply, of a cushioned support having a non-absorbent covering and located within the receptacle, and a filamentous device upon the support and extending below the same, substantially as described.

4. In a moistening device, the combination with a suitable receptacle adapted to contain a liquid-supply, of a cushioned support having a non-absorbent covering and located within the receptacle, and a cloth strip upon the support and extending below the same, substantially as described.



5. In a moistening device, the combination with a support of non-absorbent material, of a filamentous absorbent covering for the support, a non-absorbent plate upon the said covering, a filamentous covering for the said plate and an absorbent connection between the two coverings, substantially as described.

6. In a moistening device, the combination with a support of non-absorbent material, of a filamentous absorbent covering for the support, a non-absorbent plate upon the said covering, a filamentous covering for the said plate and means for conveying moisture from one covering to the other, substantially as described.

7. In a moistening device, the combination with a non-absorbent support, of an absorbent covering for the same, a plate having a foraminated upper surface upon the said covering, an absorbent covering for the said plate, and means for conveying moisture from one covering to the other, substantially as described.

8. In a moistening device, the combination with a non-absorbent support, of an absorbent covering for the same, a curved plate upon the said covering, an absorbent covering for the said plate, and means for conveying moisture from one covering to the other, substantially as described.

608,769. BICYCLE-SUPPORT. MICHAEL KELLY, Buffalo, N. Y. Filed Apr. 23, 1897. Serial No. 633,371. (No model.)

Claim.—1. In a velocipede-support, the combination with the supporting-leg adapted to be movably connected with a velocipede-frame, of a bearing-shoe pivoted on said leg and provided with a locking-arm, and a locking-sleeve sliding on said leg and adapted to engage with said arm, substantially as set forth.

2. In a velocipede-support, the combination with the supporting-leg adapted to be movably connected with a velocipede-frame, of a bearing-shoe pivoted to said leg and provided on opposite sides of its pivot with locking-arms, and a locking-sleeve sliding on said leg and adapted to engage with either of said locking-arms, substantially as set forth.

3. In a velocipede-support, the combination with a rock-shaft adapted to be mounted on a velocipede-frame, of a spindle journaled transversely on said shaft, a supporting-leg journaled in said spindle so as to turn at an angle to the axis of the spindle and a laterally-projecting shoe arranged on the supporting-leg, substantially as set forth.

4. In a velocipede-support, the combination with a rock-shaft adapted to be mounted on a velocipede-frame, of a spindle journaled transversely on said shaft, a supporting-leg journaled in said spindle so as to turn at an angle to the axis of the spindle, a laterally-projecting shoe arranged at the lower end of the supporting-leg, a flat-sided arm arranged at the upper end of the supporting-leg, and a cam with which said arm engages, substantially as set forth.

5. In a velocipede-support, the combination with the supporting-legs, of transverse rock-shafts carrying said legs, bearings in which said shafts are journaled and which are adapted to be mounted on a velocipede-frame, and a coupling which connects the adjacent ends of the rock-shafts but permits each shaft to turn independent of the other, substantially as set forth.

6. In a velocipede-support, the combination with the supporting-legs, of transverse rock-shafts carrying said legs, bearings in which said shafts are journaled and which are adapted to be mounted on a velocipede-frame, and a rock-arm pivoted concentric with the shafts but loosely connected therewith, substantially as set forth.

7. In a velocipede-support, the combination with the bearings adapted to be mounted on a velocipede-frame, of hollow transverse

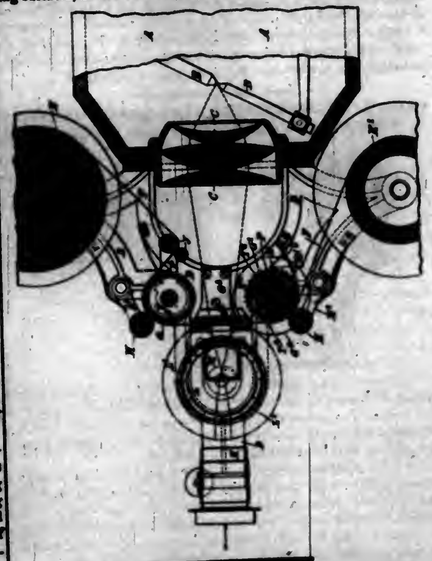
rock-shafts journaled in said bearings and having their abutting inner ends provided with external annular flanges and with segmental recesses, supporting-legs arranged on the outer ends of the rock-shafts, a coupling-sleeve provided with internal shoulders which bear against the outer sides of the flanges of the rock-shafts, an arbor arranged with its ends in the inner ends of the hollow rock-shafts, and a rock-arm arranged in the recesses of both rock-shafts and in an opening in the coupling-sleeve and secured with its inner end to said arbor, substantially as set forth.

608,770. WATER-WHEEL. AUGUSTUS KENNEY, Los Angeles, Cal., assignor of one-half to John R. Wilson, same place. Filed Mar. 9, 1897. Serial No. 626,626. (No model.)

Claim.—1. A water-wheel body consisting of a pair of convex or conical plates, the hub and rings to which such convex or conical plates are attached by rivets, the said convex or conical plates approaching toward or touching each other at their circumferences, and having notches or recesses cut into said circumferences, each such notch or recess forming a seat or support for each bucket or cup of the water-wheel, substantially as set forth.

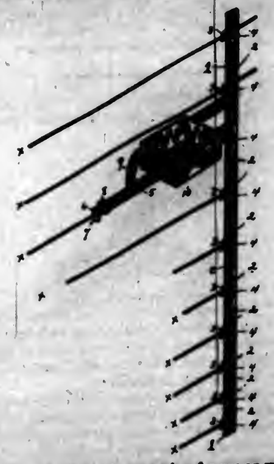
2. A water-wheel body consisting of a pair of convex or conical plates, the hub and rings to which such convex or conical plates are attached by rivets, the said convex or conical plates approaching toward or touching each other at their peripheries, and having a ring riveted between them, the edges of such conical plates or disks and the ring between them having recesses or notches cut into each of them to constitute seats for the buckets or cups, substantially as hereinbefore described and shown upon the annexed sheet of drawings.

3. The improved buckets or cups for water-wheels, consisting of a cup-body into or against the front portion of which each jet of water impacts, or pair of jets impact, and having a pair of wings or lugs reaching backward from the impact portions which bind or support the rim of the wheel, also having two curved discharge-passages, one on each side of the rim of the wheel at the rear part of each bucket, the said buckets being attached by the wings or lugs to the circumference of the body of the wheel and so as to fit into the recesses or seats cut into the circumference of the wheel and attached outside the convex disks or plates, substantially as described and shown upon the annexed drawings.



4. The improved water-wheel consisting of the combination of a pair of convex or conical circular plates, the hub to which said conical or circular plates are riveted, the ring between the plates at their circumferential portions, the recesses constituting seats in the circumference of the wheel for receiving the rear portions of the buckets, the wings or lugs on the said buckets whereby the buckets are attached by rivets to the body of the wheel, the buckets being constructed with the blade or fin like portion at the center of the back and with the double discharge at the back or sides thereof, all operating together in the manner and for the purposes substantially as set forth.

608,771. PROJECTING KINETOSCOPE. JOHN H. MACKENZIE, Jr., London, England. Filed Apr. 17, 1897. Serial No. 632,611. (No model.)



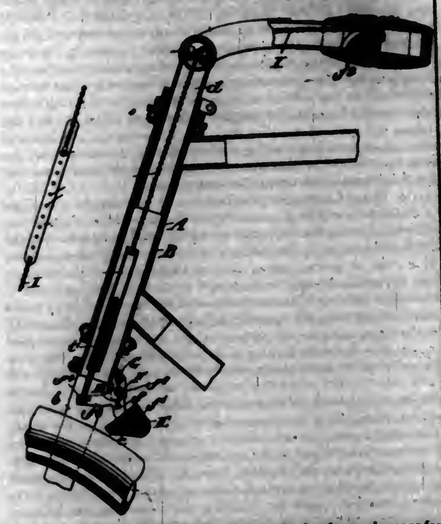
Claim.—1. Apparatus for securing, or for exhibiting in series, records of successive phases of movement, consisting of a body, of the nature of a magic lantern, a condenser, an objective, and a source of light, a series of transparent pictures, means for giving a continuous movement to the pictures, a series of continuously-moving refracting-surfaces, means for moving the same simultaneously with the pictures, and a series of fixed lenses, all substantially as and for the purpose set forth.

2. In an apparatus for producing the effect of what are termed "animated pictures," the combination of a series of pictures and means for continuously moving the same, with a rotary prism of refractive material and means for rotating the same to correspond with the movement of the film substantially as herein described, whereby there are presented to each successive picture a pair of oppositely-refracting surfaces whose inclination to the plane of the film varies in accordance with the various positions of the picture as herein set forth.

3. In apparatus for producing the effect of what are termed "moving pictures" in which a film or moving series of transparent pictures, a stationary objective and a moving series of refracting-surfaces between the objective and the condenser are employed, the combination with the film or series of pictures and means for carrying the same, of means for moving the film and the refracting-surfaces simultaneously and means for moving the film independently of the refracting-surfaces, as and for the purpose herein set forth.

608,772. SPACER-BAR FOR WIRE FENCES. GEORGE H. HILLIS, Norwalk, Ohio. Filed Jan. 10, 1898. Serial No. 666,166. (No model.)

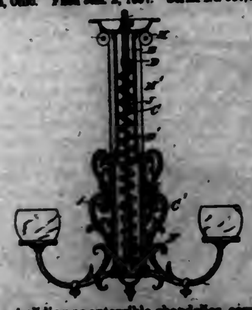
Claim.—1. An adjustable spacer-bar for use on wire fences, consisting of a perforated vertical bar provided with a number of hooks, a horizontal arm having a bifurcated end and held on said bar, combined with a catch on said arm; substantially as described.



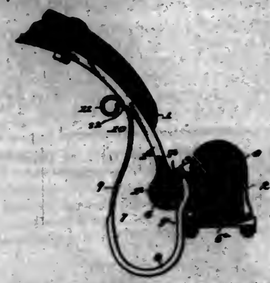
2. An adjustable spacer-bar for use on wire fences, consisting of a perforated vertical bar provided with a number of hooks adjusted as described, a horizontal arm having a bifurcated end and held on said bar, combined with a pivoted catch and a brace; substantially as described.

608,773. DRESS-SHIELD ATTACHMENT. FRANK H. MITCHELL, New York, N. Y., assignor of one-third to Charles T. Rost, East Orange, and Charles G. Phillips, Montclair, N. J. Filed July 15, 1897. Serial No. 644,691. (No model.)

Claim.—An attachment for dress-shields consisting of two separable members one comprising two flexibly-connected jaws in the exteriors of which are indentations and the other comprising a spring-clasp having its ends turned inwardly to enter the said indentations, the said jaws being further provided with external projections at the ends of the indentations for preventing the accidental longitudinal displacement of the two members relatively to each other, substantially set forth.



608,774. BICYCLE-BRAKE. CHARLES HEILENTHAL, New York, N. Y. Filed Aug. 17, 1897. Serial No. 648,512. (No model.)

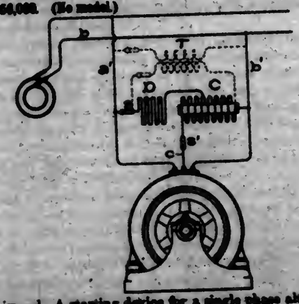


Claim.—A bicycle-brake comprising a brake-shoe and means for operating it consisting of a grip composed of two sections, one being mounted permanently upon the handle and the other being hinged to the permanent section and normally in line therewith, the said hinged section being connected with the brake-shoe, whereby, as the section is rocked, the shoe will be operated, substantially as set forth.

608,775. EXTENSION GAS-CHANDELIER. JAMES T. REES, Cleveland, Ohio. Filed Jan. 2, 1897. Serial No. 617,713. (No model.)

Claim.—A sliding or extensible chandelier, comprising a supply-pipe and upper stationary casing surrounding said supply-pipe, a delivery-pipe connected centrally to a lower movable casing and depending therefrom, a coiled flexible pipe connected at one end to the supply-pipe and at the other end to the delivery-pipe, and rods projecting from said supply and delivery pipes, around which the coils of the flexible pipes are coiled so that said rods serve as guides for said flexible pipe, substantially as shown and described.

608,776. COMBINED THILL-SUPPORT AND ANTIRATTLER. JOSEPH SHEFFER, Rensselaer, N. Y. Filed June 20, 1897. Serial No. 642,262. (No model.)



Claim.—In shaft attachments, the combination with the fore axle and shaft, of a coupling comprising a clip 4 engaging the axle and provided with the forwardly-projecting arms 5 and bottom clamping-plate 5ª, a shaft-iron having an eye swiveled to the arms 5 and a guide-loop 12, and a combined antirattler and shaft-support 7 comprising a strip of spring metal having a U-shaped body portion 8 provided with a straight limb 8ª bearing against the clamping-plate 5ª and having a segmental extremity 8ᵇ bearing against the shaft-iron eye and clamped thereby against the clip, and a curved limb 9 extended to form a spring-arm 10 having its free end projecting through the guide-loop 12 and formed with a stop-coil 11, substantially as described.

608,777. MEANS FOR CARRYING VELOCIPEDES IN RAILWAY-CARS. FREDERIC H. SERINE, London, England. Filed Nov. 19, 1897. Serial No. 658,186. (No model.)

Claim.—The means for carrying and protecting velocipedes in railway-cars, consisting in the combination of bars, rods or fillets placed on the floor of the car to receive the wheels, attaching devices on the walls of the car, covers for the velocipedes provided with openings, and cords passing through the velocipedes and through the openings in their covers and attached to said devices for at the same time securing the velocipedes in place and securing the covers thereon, all substantially as herein described.

608,778. STARTING DEVICE. JOSEPH P. STORK, Schenectady, N. Y., and SAMUEL R. BOARD, Marlborough, Mass., assignors to the General Electric Company, of New York. Filed Oct. 23, 1897. Serial No. 656,002. (No model.)

Claim.—1. A starting device for a single phase alternating-current motor, comprising two phase-displacing devices in series across the mains, and in shunt to the motor, one of the phase-displacing devices consisting of a step-up transforming device designed to deliver from a point between the phase-displacing devices to a third terminal of the motor a higher than normal voltage.

2. In combination, a motor having three terminals, two of which are connected to a source of single-phase current directly or induct-

ively, and the third terminal of which is connected to the mains through phase-displacing devices consisting of a resistance and step-up transformer in series across the mains, the third terminal of the motor being connected between the phase-displacing devices.

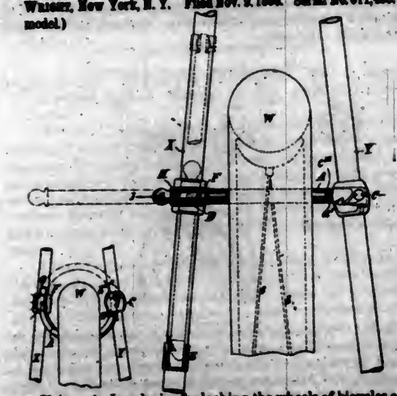
3. As a means of starting a single-phase alternating-current motor, a resistance and a compensator in series across the main circuit, the resistance being connected at one end to one side of the main circuit and at the other end to an intermediate point of the compensator, the latter being connected at one end to the other side of the circuit and at the other end to the third terminal of the motor.

608,779. RAIL-JOINT. JAMES WATLAND, Newark, N. J. Filed Jan. 22, 1898. Serial No. 667,540. (No model.)

Claim.—1. A bed-plate for an insulated rail-joint having a plane floor, vertical longitudinal side ribs of different height integral therewith and projecting lateral flanges notched to receive spikes, an insulating-shim confined between the ribs, and a coupling-block bearing on the shim and overlapping the low rib.

2. A reversible insulating-shim for a rail-joint having secured in one end of the same one or more metal blocks to receive the impact of a train, whereby the shim and blocks may be handled as a single piece.

3. An insulating-shim for a rail-joint having mounted in or secured thereto one or more metal blocks, and provided with means for locking it to a bed-plate symmetrically placed with respect to its ends whereby it may be reversed end for end for the purpose described.



4. In an insulated railway-joint the combination of a bed-plate provided with ribs at its sides, bolt-holes symmetrically placed with respect to its ends, and a reversible shim having one or more metal blocks at one end and bolt-holes to register with those of the bed-plate.

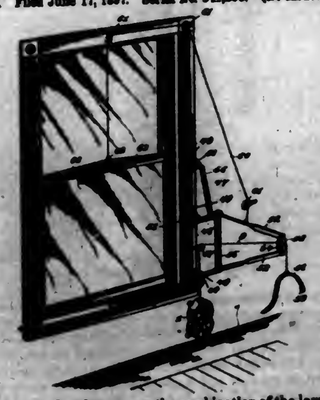
5. An insulated railway-joint comprising a bed-plate with vertical ribs at its sides of unequal height, a reversible shim having one or more blocks in one end thereof, and coupling-blocks at the sides of the rail ends bolted together and to the bed-plate, one of said blocks resting on the lower rib and removable therefrom, the other block bearing against the high rib.

6. In an insulated rail-joint the combination of a bed-plate spanning adjacent cross-ties and provided with notched edges and vertical side ribs, a reversible shim held against lateral displacement by the side ribs, coupling-blocks at the sides of the rails, vertical bolts passing through one of the coupling-blocks, the shim and bed-plate, and horizontal bolts passing through the rail and coupling-blocks.

7. A railway-joint comprising a bed-plate and an insulating-shim of substantially the length of the floor of the bed-plate having metal blocks therein at a point between its ends.

608,780. LOCKING DEVICE FOR BICYCLES. FRANCIS H. WRIGHT, New York, N. Y. Filed Nov. 9, 1896. Serial No. 611,495. (No model.)

Claim.—1. In a device for locking the wheels of bicycles or other vehicles, the combination of a lock-bar as A, a pivoted sleeve, as B, open at both ends, through which the bar passes and projects and is free to be drawn backward and forward from either end, secured at one side of the wheel, and a lock-box, as C, secured at the opposite side of the wheel, containing locking devices which are adapted to engage the end of the lock-bar when inserted in the box and hold the same so that it cannot be withdrawn until released from the locking devices by means of a key or other equivalent device as above described, substantially as set forth and described.



2. In a device for locking the wheels of bicycles and other vehicles, the combination of a lock-bar as A, a pivoted sleeve, as B, open at both ends, through which the bar passes and projects and is free to be drawn backward and forward from either end, a lock-box, as C, containing locking devices which are adapted to engage the end of the lock-bar when inserted in the box and hold the same so that it cannot be withdrawn until released from the locking devices by means of a key or other equivalent device as above described, and means for attaching the sleeve and the lock-box respectively to the frame or other parts of the bicycle or vehicle, substantially as set forth.

3. Means for attaching the sleeve to the frame or other part of the bicycle or vehicle; consisting in the combination of a base to which the sleeve is secured by means of a pivot passing through the wall of the sleeve and a spring-collar partially encircling the frame or other part of the bicycle or vehicle and secured to the base by a tongue-and-groove joint and by a screw or screws passing through the base into the collar, arranged and adapted so that the hollow sleeve which is pivoted to the base and through which the lock-bar passes will cover the head of the screw whenever the lock-bar is in the locked position and will uncover the head of the screw when the lock-bar is in the unlocked position, substantially in the manner and for the purposes above described and set forth.

4. Means for attaching the lock-box to the frame or other part of the bicycle or vehicle; consisting in the combination of a lock-box with a projecting shoulder, and a spring-collar partially encircling the frame and secured to the lock-box by a tongue-and-groove joint and by a screw or screws passing through the shoulder of the lock-box into the collar, arranged and adapted so that the lock-bar when in the locked position will cover the head of the screw and when in the unlocked position, will uncover the head of the screw, substantially in the manner and for the purposes above described and set forth.

5. In a device for locking the wheels of bicycles and other similar vehicles, the combination of a lock-bar, a pivoted sleeve open at both ends through which the bar passes and projects and is free to be drawn backward and forward from either end, secured at one side of the wheel, a lock-box, secured at the opposite side of the wheel, containing locking devices which are adapted to engage the end of a lock-bar when inserted in the box and hold the same so that it cannot be withdrawn until released from the locking devices by means of a key or other equivalent device as above described, and the above-described means for attaching the sleeve and the lock-box respectively to the frame, adapted and operating to cover and lock the devices by which the sleeve and lock-box respectively are attached to the frame so that they cannot be removed from the frame whenever the lock-bar is in the locked position, and to expose the attaching devices so that they can be removed from the frame whenever the lock-bar is in the unlocked position, substantially in the manner and for the purposes above described and set forth.

608,781. FIRE-ESCAPE. WILLIAM H. ANDERSON, Frewsburg, N. Y. Filed June 17, 1897. Serial No. 641,200. (No model.)

Claim.—1. In a fire-escape, the combination of the lowering rope or cable and a reel therefor located to the inside of the window, a swinging bracket mounted to the inside of the window and swinging on a vertical axis, said bracket being provided with a vertically-arranged hinge-joint and adapted to fold upon itself, whereby the bracket may be swung around the window-casing so as to project outwardly beyond the same, a guide mounted on the end of said bracket and over which said rope or cable is passed, and a vertically-arranged antifriction-roller having its axis coincident with the axis of said hinge-joint of the bracket, substantially as and for the purpose set forth.

2. In a fire-escape, the combination of the lowering rope or cable, a swinging bracket provided with a guide over which said rope or cable is passed, said bracket being mounted upon a stationary support to the inside of the window and normally swung inwardly out of the way, a flexible connection attached by its respective ends to the lower window-sash and to the swinging bracket and one or more guides over which said connection passes between its points of attachment, whereby the said flexible connection serves as a stay for the swinging bracket when the latter is swung into position out of the window, substantially as and for the purpose set forth.

3. In a fire-escape, the combination of the lowering rope or cable and a reel therefor, a brake-shoe for said reel, a pivoted arm and a pivotal link connecting said arm and shoe, a lever connected with said pivotal arm and engaging with and actuated by said lowering-rope, and a spring for returning said parts to their normal positions after the brake-shoe has been applied, substantially as and for the purpose set forth.

4. In a fire-escape, the combination of the lowering rope or cable and a reel therefor, a brake-shoe for said reel, a pivoted arm and a pivotal link connecting said arm and shoe, the said arm and link being adjustably connected with each other to vary the leverage, a lever connected with said pivotal arm and engaging with and actuated by said lowering-rope, and a spring for returning said parts to their normal positions after the brake-shoe has been applied, substantially as and for the purpose set forth.

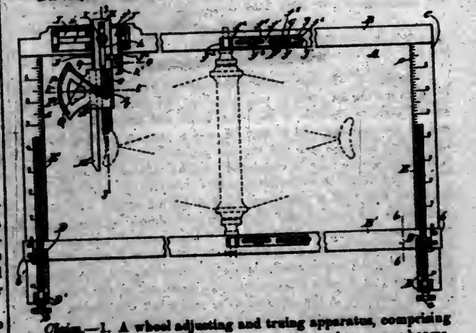
5. The combination of a wheel and a sectional brake-shoe provided with arc-shaped sections loosely attached to each other by a link and having an interposed spring, an operating-bar for the brake-shoe and a lowering-rope engaging with and actuating said bar, one of said brake-shoe sections being pivoted to a stationary point and the other being pivoted to the operating-bar, substantially as and for the purpose set forth.

6. In a fire-escape, the combination of the lowering rope or cable and a reel therefor, a brake-shoe comprising independent sections yieldingly connected together, a brake-lever engaging with and actuated by said rope and connections between said lever and one of the brake-shoe sections, the other of said brake-shoe sections being pivotally mounted on a stationary point, substantially as and for the purpose set forth.

7. In a fire-escape, the combination of a lowering rope or cable and a reel therefor, a brake-shoe for the reel actuated by the tension of the lowering-rope, a lever engaging with and actuated by said lowering-rope and connections between said lever and brake-shoe, and adjustable means for regulating the range of movement of the lever to regulate the power with which the brake-shoe is applied in accordance with the tension on the rope.

8. In a fire-escape, the combination of a lowering rope or cable and a reel therefor, a brake-shoe, a brake-lever actuated by said rope or cable, and connections between said brake-shoe and lever, and a sliding gage having stepped rests adapted to be engaged by said brake-lever for varying the stroke of said lever and operating means for said gage, substantially as and for the purpose set forth.

9. In a fire-escape, the combination of a lowering rope or cable and a reel therefor, a brake-shoe for the reel actuated by the tension of the lowering-rope, a lever engaging with and actuated by said lowering-rope and connections between said lever and brake-shoe, adjustable means for regulating the range of movement of the lever to regulate the power with which the brake-shoe is applied in accordance with the tension on the rope, and a visual indicator connected with and controlling the movement of said adjustable means and provided with a scale of weights, whereby the setting of the indicator at a certain weight on the scale serves to regulate the range of movement of said lever so as to apply the brake-shoe with a force in accordance with said indicated weight, substantially as and for the purpose set forth.



10. In a fire-escape, the combination of a window provided with a movable sash, a swinging fire-escape normally lying within the window and adapted to be swung out through the opening of the window, and connections between said window-sash and fire-escape, whereby upon swinging the latter around to adjust it out of the window, the sash is automatically opened, substantially as and for the purpose set forth.

11. In a fire-escape, the combination of a window provided with a movable sash, a fire-escape provided with a lowering-rope and having a swinging bracket carrying said rope, and connections between said sash and swinging bracket, whereby upon swinging the bracket out of the window to adjust the rope for lowering, said sash is automatically opened, substantially as and for the purpose set forth.

12. In a fire-escape, the combination of a lowering rope or cable and a reel therefor, a fast pinion 38 and loose gear 42 mounted upon the shaft of the reel, idle-gears 39 and 41 connecting said fast pinion and loose gear, whereby the rotation of the one actuates the other, and a spring 44 for rotating the reel backwardly to wind up the rope, said spring being connected with said shaft and loose gear respectively and wound by said loose gear, substantially as and for the purpose set forth.

13. In a fire-escape, the combination of a window provided with a movable sash, an adjustable fire-escape and connections between the same and said window-sash, whereby upon adjusting the fire-escape for use the sash is automatically opened by the adjusting movement, substantially as and for the purpose set forth.

608,782. AUTOMATIC INDICATOR FOR TRUING WHEELS. GEORGE BROWN, Long Island City, N. Y. Filed Feb. 25, 1897. Serial No. 624,712. (No model.)

Claim.—1. A wheel adjusting and truing apparatus, comprising a framework consisting of a longitudinal beam and two cross-beams, and an adjustable beam mounted upon the said cross-beams, said cross-beams having graduations upon the upper surfaces thereof and said longitudinal beams having clamps secured respectively to their upper surfaces, and means for adjusting the movable beam, substantially as shown and described

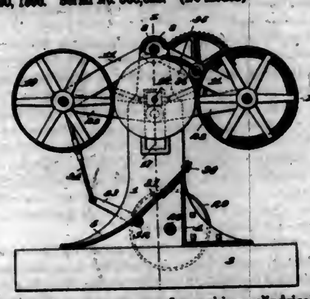
2. As a wheel adjusting and truing apparatus, the combination of the framework, comprising a longitudinal beam having two cross-beams extended from the ends thereof and an adjustable longitudinal beam mounted upon the said cross-beams, and means for adjusting the movable beam, and oppositely-located clamps comprising sliding plates and converging jaws mounted respectively upon the longitudinal beam of the framework and the adjustable beam and graduated scales upon the cross-beams and an indicator mounted upon the rigid beam of the framework, said indicator having a spring-actuated piston therein with a wheel mounted in its outer end, and said piston connected to a pointer which registers with a protractor, substantially as shown and described.

3. In a wheel adjusting and truing apparatus, the combination of the framework, comprising a longitudinal beam and two oppositely-located beams extended at right angles thereto and having scales marked upon their upper surfaces, and an adjustable beam mounted upon the said beams by means of an adjusting-screw engaging respectively with projections or lugs extended from the movable beam and the cross-beams, and clamps mounted respectively upon the beam of the framework and upon the adjustable beam, said clamps comprising fixed plates and sliding plates and screw for adjusting them, and converging jaws or projections extending from the said plates and an indicator comprising a fixed plate and adjustable plates located at right angles thereto, and means for adjusting the plates; said a box having a spring-actuated piston therein which engages with a needle which registers with a protractor projected from the said box, substantially as shown and described.

4. An automatic indicator adapted for use in connection with a wheel-truing apparatus, comprising a fixed plate having a slot therein, a sliding plate arranged at right angles therewith and an auxiliary slotted plate arranged parallel with the said sliding plate and a screw connecting the parts to each other, the said sliding plate having a scale thereon which registers with a pointer of the auxiliary sliding plate, and a box projected from the auxiliary sliding plate and having a spring-actuated piston engaging therewith, which piston

engages with a forked pointer which registers with a protractor extended from the said box, the said piston having a wheel journaled in the outer end thereof for engagement with the edge of a wheel-rim to be adjusted, the said box also having a removable blade extended therefrom for the purpose of maintaining a wheel in position, substantially as shown and described.

5. A wheel adjusting and truing apparatus, comprising a longitudinal beam having cross-beams extended from each end thereof, and an adjustable beam engaging with the cross-beams, and means for locking the adjustable beam to the cross-beams; in combination with an automatic indicator, mounted upon the said stationary longitudinal beam, comprising a lower plate and an upper slotted plate arranged parallel with each other and means for locking them to each other, the lower plate having a scale thereon which registers with a pointer upon the upper plate, and a box connected to the upper plate and having a spring-actuated piston therein which engages with a needle and has a wheel upon the outer end thereof, and a protractor for registering with the said needle, substantially as shown and described.



608,783. SASH-HOLDER. HOWARD W. DEHEAN, Bronson, Fla., assignor of one-half to H. Benjamin Lloyd, same place. Filed Dec. 20, 1896. Renewed Aug. 23, 1897. Serial No. 649,242. (No model.)

Claim.—1. The herein-described sash-holder, consisting of a base or plate having an offset or projection on one side, a spring secured to said plate at one side of said offset or rib and projecting at its free end on the opposite side of said rib, and a fastener passing through said spring between one end thereof and said rib, whereby the tension of the spring may be regulated, substantially as described.

2. The herein-described sash-holder, comprising a plate provided upon one side with a transverse rib and having spaced nibs or projections at the ends of said rib forming shoulders for engaging the side edges of a spring, a spring secured at one end of said plate upon one side of said rib and projecting at its free end on the opposite side of said rib, and a screw passing through said spring and into the plate and located at a point intermediate the fixed end of the spring and said rib, whereby in the adjustment of said screw the tension of the spring may be regulated, substantially as described.

608,784. COTTON-PRESS. FRANK L. DYER, Washington, D. C., assignor to the American Cotton Company, New York, N. Y. Filed Feb 20, 1896. Serial No. 580,083. (No model.)

Claim.—1. In a cotton-press for making cylindrical bales, the combination of two baling-rolls, each carried solely in swinging arms pivoted at or near a common point, so that said arms may be swung apart as the bale enlarges and a support for the bale, substantially as set forth.

2. In a cotton-press for making cylindrical bales, the combination of two baling-rolls, each carried solely in swinging arms pivoted at or near a common point, so that said arms may be swung apart as the bale enlarges, a support for the bale and means for driving said baling-rolls, substantially as set forth.

3. In a cotton-press for making cylindrical bales, the combination of two baling-rolls, each carried solely in swinging arms pivoted at or near a common point, so that said arms may be swung apart as the bale enlarges a support for the bale, means for driving said baling-rolls, and means for keeping the faces of said baling-rolls parallel with each other, substantially as set forth.

4. In a cotton-press for making cylindrical bales, the combination of two baling-rolls, each carried solely in swinging arms pivoted at or near a common point, so that said arms may be swung apart as the bale enlarges a support for the bale, means for driving said baling-rolls and means for effecting pressure on said baling-rolls, substantially as set forth.

5. In a cotton-press for making cylindrical bales, the combination of two baling-rolls, each carried solely in swinging arms pivoted at or near a common point, so that said arms may be swung apart as the bale enlarges, means for driving said baling-rolls, and a core mounted between said baling-rolls on which the bale is formed, substantially as set forth.

6. In a cotton-press for making cylindrical bales, the combination of a core on which the bale is formed, a baling-roll normally in substantially the same horizontal plane as the core, two swinging arms pivoted in a plane above the core and carrying said baling-roll at their lower ends, a second baling-roll pressing on the other side of the bale, and means for driving said baling-rolls, substantially as set forth.

7. In a cotton-press for making cylindrical bales, the combination of two baling-rolls arranged in the same horizontal plane, and each carried in swinging arms, a horizontal shaft from which said swinging arms are hung, whereby said swinging arms may be swung apart as the bale enlarges and a support for the bale, substantially as set forth.

8. In a cotton-press for making cylindrical bales, the combination of two baling-rolls arranged in the same horizontal plane, and each carried in swinging arms, a horizontal shaft from which said swinging arms are hung, whereby said swinging arms may be swung apart as the bale enlarges, a support for the bale and means for driving said baling-rolls, substantially as set forth.

9. In a cotton-press for making cylindrical bales, the combination of two baling-rolls arranged in the same horizontal plane, and each carried in swinging arms, a horizontal shaft from which said swinging arms are hung, whereby said swinging arms may be swung apart as the bale enlarges a support for the bale, means for driving said baling-rolls, and means for effecting pressure on said baling-rolls, substantially as set forth.

10. In a cotton-press for making cylindrical bales, the combination of two baling-rolls arranged in the same horizontal plane, and each carried in swinging arms, a horizontal shaft from which said swinging arms are hung, whereby said swinging arms may be swung apart as the bale enlarges, means for driving said baling-rolls, and a core mounted between said baling-rolls and on which the bale is formed, substantially as set forth.

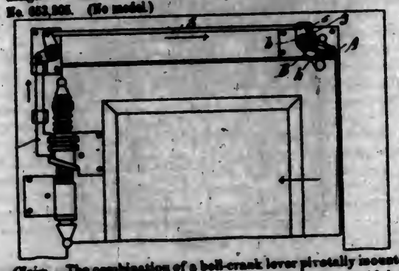
11. In a cotton-press for making cylindrical bales, the combination of two baling-rolls arranged in the same horizontal plane, and each carried in swinging arms, a horizontal shaft from which said swinging arms are hung, whereby said swinging arms may be swung apart as the bale enlarges, means for driving said baling-rolls, a core mounted between said baling-rolls on which the bale is formed, and means for elevating the core as said baling-rolls are moved upward, whereby said core will be always maintained substantially in line with the horizontal axis of the baling-rolls, substantially as set forth.

12. In a horizontal two-roll baling-press, the combination of the two baling-rolls, a core mounted between said baling-rolls and on which the bale is formed, a bar beneath and parallel with said core when the baling-rolls are at their innermost positions, and means for withdrawing said bar as the baling-rolls separate, substantially as set forth.

13. In a horizontal two-roll baling-press, the combination of the roll on which the bat is received, the core, the other roll, a scraper carried upon or adjacent to the latter roll for the purpose mentioned, and means for elevating the scraper as the bale enlarges, substantially as set forth.

14. In a horizontal two-roll baling-press, the combination of the side frames 1, 1, a horizontal bearing 7 at the upper part of each side frame, swinging arms 11 supported by said bearing, baling-rolls carried at the lower ends of said swinging arms a bale-support, a shaft 8 mounted in said bearings, and connections between said shaft and said baling-rolls for driving the latter, substantially as set forth.

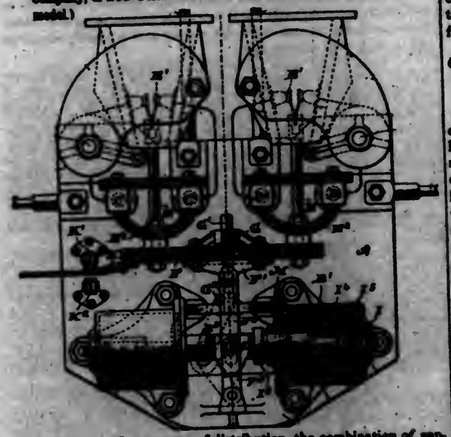
15. In a horizontal two-roll baling-press, the combination of the side frames 1, 1, a horizontal bearing 7 at the upper part of each side frame, swinging arms 11 supported by said bearing, baling-rolls carried at the lower ends of said swinging arms a bale-support, a shaft 8 mounted in said bearing, a pinion keyed to said shaft, another pinion loose on said shaft, a clutch 15 for connecting said loose pinion with said shaft, and connections between said pinions and said baling-rolls for driving the latter, substantially as set forth.



16. In a horizontal two-roll baling-press, the combination of the side frames 1, 1, a horizontal bearing 7 at the upper part of each side frame, swinging arms 11 supported by said bearings, baling-rolls carried at the lower ends of said swinging arms, means for driving said baling-rolls a bale-support, arms 23 connecting with the lower ends of said swinging arms, said arms 23 converging together at their lower end, a rack 25 connected with the lower end of each pair of converging arms 23, a pinion 27 engaging with each of said racks, and a shaft 28 extending across the machine and to which said pinions are keyed, substantially as set forth.

17. In a horizontal two-roll baling-press, the combination of the side frames 1, 1, a horizontal bearing 7 at the upper part of each side frame, swinging arms 11 supported by said bearings, baling-rolls carried at the lower ends of said swinging arms, means for driving said baling-rolls, a bearing-box 18 sliding vertically in each side frame, links 21 connecting said bearing-boxes with the swinging arms 11, and a core-supporting device in each bearing-box, substantially as set forth.

18. In a horizontal two-roll baling-press, the combination of the two baling-rolls, a core mounted between said baling-rolls on which the bale is formed, a plate 31 mounted in the side frames, a bar 30 at the upper end of said plate arranged beneath the core at the starting of the bale, and means for moving said plate 31 so that when the bale is formed, said plate will constitute a guide or chute for receiving the bale, substantially as set forth.



19. In a cotton-press for making cylindrical bales, the combination of a main driving-shaft to which power is applied, a pair of baling-rolls movable toward and away from said shaft for effecting compression of the bale, connections between said driving-shaft and rolls for driving the latter, flanges for the ends of the bales, and connections between the flanges and rolls, whereby the flanges will be movable with the rolls toward and away from said driving-shaft, substantially as set forth.

608,785. DOOR-BUFFER. JULIUS F. PÖSCHEL, Leipsic, Germany, assignor to Emil Oscar Beyer, same place. Filed Oct. 2, 1897. Serial No. 653,905. (No model.)

Claim.—The combination of a bell-crank lever pivotally mounted on the door-frame in proximity to the door, a slide-pin in said bell-crank-lever end, having mounted thereon a spring-pressed buffer, a catch-lever pivoted to the said bell-crank-lever arm and having one end connected to the slide-pin aforesaid, a cam mounted in proximity to the opposite end of said catch-lever, means for lowering the buffer-arm of the bell-crank lever into the path of the door when the latter is opened and means for releasing the catch mechanism and raising the said arm immediately the door has struck the buffer substantially as described.

608,786. ELECTRICALLY-CONTROLLED SWITCH. HOWARD M. HEWLETT, Schenectady, N. Y., assignor to the General Electric Company, of New York. Filed Jan. 23, 1897. Serial No. 620,311. (No model.)

Claim.—1. In a system of distribution, the combination of supply and branch mains, a single auxiliary main extending from the point of control, as for example, a supply or sub station, to a switch for opening and closing the circuit between the supply and branch mains, an electromagnetically-controlled switch, comprising a pair of electromagnets, each having a coil permanently connected to a supply-main at one end, and alternately connected to the auxiliary main by an automatic switch.

2. In a system of distribution, the combination of positive and negative circuit-mains, branch mains leading therefrom, a single auxiliary main, an electromagnetically-controlled switch for making and breaking the circuit of the branch mains, comprising a pair of magnets each having coils permanently connected to separated mains at one end, and so arranged that one coil is always open-circuited, an automatic switch for alternately connecting the coils to the auxiliary wire, and a manually-actuated switch for including the auxiliary main in circuit with either the positive or negative supply-main.

3. The combination of supply-mains, branch mains adapted to be connected to and disconnected from the supply-mains, two solenoid-magnets acting upon a core common to both, a toggle connected to the core, contacts actuated by the toggle for making and breaking the circuit between the supply and branch mains, and a switch in the circuit of the solenoids controlled by the toggle.

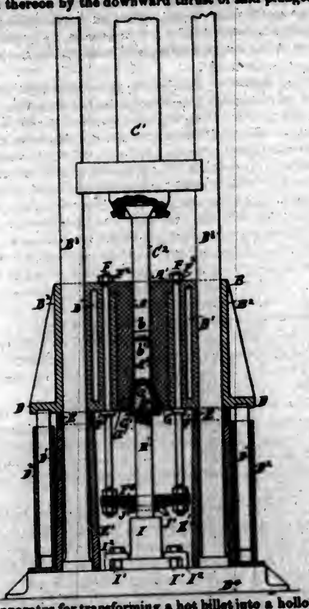
4. In a switch, the combination of fixed contacts, solenoid-magnets, a toggle acted upon by the magnet-core, contacts actuated by the toggle, and a spring acting on both sides of a dead-center and connected with the toggle.

5. In a switch, the combination of fixed contacts, solenoid-magnets, cores for the magnets, contacts actuated by the core, a single auxiliary contact also actuated by the cores for controlling the circuit of both solenoid-coils, and means whereby a certain interval of time is allowed to elapse between the operation of the main and auxiliary contacts.

6. In a switch, the combination of stationary contacts, a plurality of moving contacts, solenoid-magnets, a core common to the magnets for actuating the toggle, a guide for the toggle, a spring acting on both sides of a dead-center to assist the core, an auxiliary contact also operated by the core, means permitting a certain amount of movement of the core independent of the auxiliary contact, and means for supplying current to the solenoid-coils for operating the switch.

7. In a switch, the combination of a solenoid, an iron casing surrounding it, a hollow core secured to one end of the casing, a plate secured to the opposite end of the casing, a core provided with parts differing in their cross-section, a shoulder on the core adapted to engage with the plate on the end of the casing, and a buffer for lessening the effect of the hammer-blow at the end of the movement of the core.

8. In a switch, the combination of a solenoid-magnet, a core, a toggle actuated thereby, an energizing-coil on the magnet, a contact connected with the coil, an arm actuated by the core, a contact carried by the arm, a cam for insuring a quick break between the moving and stationary contacts, and means permitting a predetermined amount of movement of the core independent of the arm.



9. In a solenoid-magnet, the combination of an inclosing casing and energizing-coil, a cylindrical straight-bored core, a removable cap having a central opening, the metal surrounding the opening having an increased cross-section to provide a good magnetic circuit, a cylindrical movable core comprising two parts differing in their cross-section, and a piece of non-magnetic material arranged to guide the movable core within the stationary hollow core and prevent them from sticking.

608,787. TUBE-FORMING APPARATUS. EMIL F. HOLINGER, Mollenport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Dec. 6, 1897. Serial No. 660,886. (No model.)

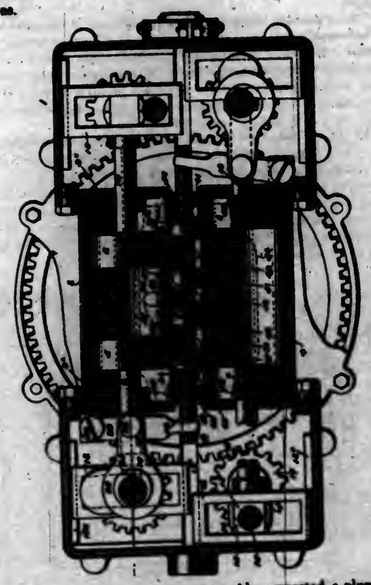
Claim.—1. In apparatus for transforming hot billets into hollow objects by forcing the exudation of the hot metal through an annular orifice, the combination, as herein set forth, of a stationary upright core having at its upper end a conoidally-pointed cylindrical core-head; a vertically-reciprocable hollow die and means for holding said hollow die stationary for feeding a billet in axial alignment with said core; means for imparting vertical movement to said die; a hydraulic plunger for forcing said billet downwardly through said die; a flaring mouth for said hollow die surrounding a prescribed portion of said conoidally-pointed core-head, and a centering-ring dislodgably seated in a bearing at the lower end of said hollow die and having a sliding fit upon the cylindrical portion of said core-head, for centralizing said core-head with relation to said flaring mouth during the initial part of the billet-transforming operation.

2. The combination, as herein set forth, of a stationary upright core having a conoidally-pointed cylindrical head; a vertically-reciprocable hollow die having a flaring mouth concentrically surrounding said conoidally-pointed core-head at a prescribed distance therefrom; a hydraulic plunger for forcing a hot billet downward through said hollow die against and around said core; means for imparting vertical motion to said hollow die, and a stripper connected to and

moving with said hollow die for stripping from said core the hollow object formed thereon by the downward thrust of said plunger upon said billet.

3. In apparatus for transforming a hot billet into a hollow object by forcing the hot metal through a hollow die against and around a conoidally-pointed cylindrical core-head; a hollow die composed of an upper portion corresponding in the shape of its cross-section to the cross-sectional shape of said billet and in a slight degree progressively increasing in cross area in a downward direction, and of a lower portion composed of a spheroidally-flaring section concentrically surrounding the conoidal part of the head of said core at a prescribed distance therefrom, and below said flaring section a cylindrical section concentrically surrounding the cylindrical part of the said core-head at a prescribed distance therefrom.

4. In apparatus for transforming a hot billet into a hollow object by forcing the hot metal to exude from an annular orifice, a stationary upright conoidally-pointed core; a hollow die arranged in appropriate alinement with said core; a vertically-reciprocable carriage for carrying said hollow die; a stripper arranged at a prescribed distance below and connected to and moving with said hollow die and carriage; means for imparting vertical movement to said carriage; a reciprocable plunger arranged at a prescribed distance above said hollow die in appropriate alinement therewith and adapted to enter said hollow die, and means for imparting endwise reciprocating movements to said plunger, as and for the purposes set forth.



608,788. ENGINE. JULIUS KELLER, Philadelphia, Pa. Filed Sept. 29, 1897. Serial No. 653,482. (No model.)

Claim.—1. In an engine, a plurality of cylinders, a valve-chamber provided with alining valves intermediate of and in communication with said cylinders, a plurality of pistons in each cylinder, a main gear rotatably supported in proximity to said cylinders, a plurality of crank-shafts, means for rotating the same by the reciprocation of said pistons, and mechanism operated by said shafts for rotating said main gear.

2. In an engine, a plurality of cylinders, each having a pair of pistons therein, a valve-chest intermediate of and in communication with said cylinders, a plurality of alining piston-valves in said chest, shafts rotated by the reciprocation of said pistons, pinions mounted on said shafts, a main gear in mesh with said pinions and connections from said shafts for operating said valves.

3. In an engine, a plurality of cylinders, each having a pair of pistons therein, an alining valve-chest located in proximity with said cylinders, a plurality of valves in said chest, yokes suitably supported and connected to the piston-rods attached to said pistons, crank-shafts on which said yokes are mounted, pinions carried by said crank-shafts, a main gear in mesh with said pinions, and mechanism intermediate said shafts and valves for reciprocating the latter.

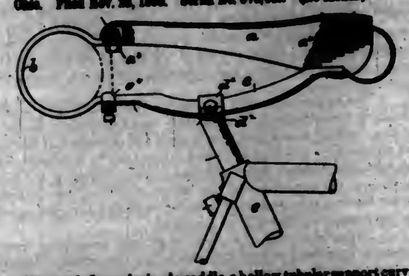
4. In an engine, a pair of cylinders arranged side by side, a valve-chest intermediate said cylinders, valves in said chest and pistons in said cylinders working oppositely to each other, a plurality of crank-shafts, a plurality of yokes, a piston-rod for each piston being secured to one of said yokes, boxes common to said yokes and shafts, slides and guides for supporting said yokes, an eccentric mounted on a pair of said shafts arranged diagonally to each other, connections from said eccentrics for operating said valves, pinions mounted on said shafts and a main gear rotatably supported and in mesh with said pinions.

5. In an engine, a main gear rotatably supported, a plurality of cylinders located adjacent to said gears, each cylinder having a pair of pistons therein moving in opposite directions, a valve-chest containing a pair of valves, means for moving the latter in opposite directions, ports leading from said valve-chest to substantially the middle of each cylinder and also to the ends of the latter, said ports serving alternately as inlet and exhaust ports, and a series of pinions rotated by the reciprocation of said pistons, said pinions meshing with said main gear.

6. In an engine, a pair of cylinders arranged side by side, a pair of pistons in each cylinder, a valve-chest connected with said cylinders, valves in said chest controlling the reciprocation of said pistons, a plurality of crank-shafts, a plurality of yokes, a rod for each piston secured to each of said yokes, boxes common to said yokes and shafts, an eccentric mounted on a pair of said shafts arranged diagonally to each other, connections from said eccentrics for operating said valves, pinions mounted on said shafts and a main gear rotatably supported and in mesh with said pinions.

7. In an engine, main gears of different diameters rotatably supported, a plurality of cylinders located above said gears, each of said cylinders having a pair of pistons therein moving in opposite directions, a valve-chest containing a pair of valves, means for moving the latter in opposite directions, ports leading from said valve-chest to substantially the middle of each cylinder, and also to the ends of the latter, said ports serving alternately as inlet and exhaust ports, a plurality of crank-shafts, rods connecting said pistons with said shafts, a plurality of gears, and a plurality of pinions of different diameters mounted on said shafts and adapted to mesh with said gears.

8. In an engine, an inclosing casing, a plurality of cylinders, a valve-chest intermediate of said cylinders and in communication therewith, alining valves in said chest, crank-shafts rotatably mounted and having their bearings in said casing, connections common to said crank-shafts, pistons and valves, a plurality of pinions mounted on each of said crank-shafts, and revolving in unison therewith, a plurality of gears meshing with said pinions, and a plurality of spindles rotatably mounted in said casing.



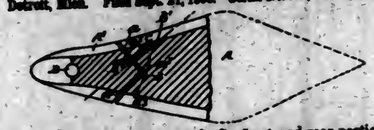
9. In an engine, an inclosing casing, a chamber supported thereon in which the motive fluid is initially received, an inlet for said fluid, a seat or passage extending transversely to said inlet, a throttle-valve longitudinally movable in said passage past said opening, a spring for retaining said throttle-valve in position, means for actuating said valve from the exterior, a plurality of cylinders located in said casing, a plurality of pistons in each of said cylinders, a valve-chest adjacent the latter and communicating therewith, a plurality of valves in said chest, means for operating said valves, crank-shafts rotatably mounted in said casing, and means for transmitting power from said shafts to a drill or tool.

10. In an engine, a plurality of cylinders, a plurality of pistons in each cylinder, valves for controlling said pistons, a plurality of main gears of varying diameters, rotatably supported in proximity to said cylinders, a plurality of crank-shafts, means for effecting the rotation of said shafts by the reciprocation of said pistons, a plurality of pinions of different diameters mounted upon each of said shafts and rotating in unison therewith, said pinions meshing with said gears and spindles actuated by the latter, said spindles rotating simultaneously and at different speeds.

11. In an engine, the combination of a plurality of cylinders, a plurality of pistons in each cylinder, a valve-chest intermediate of said cylinders, and in communication therewith, a plurality of valves in said chest, said valves being located in each end thereof, a chamber located above said chest, an inlet for the motive fluid leading into said chamber, a passage extending transversely to said inlet, a throttle-valve consisting of a plug movable in said passage and adapted to be moved past said inlet so as to wholly or partially close the latter, a spring for holding said throttle-valve in position, means for operating said valve from the exterior, a main gear rotatably supported in proximity to said cylinders, a plurality of crank-shafts, means for rotating the same by the reciprocation of said pistons and mechanism operated by said shafts for rotating said main gear.

12. In an engine, the combination of an inclosing casing, crank-shafts rotatably mounted in said casing, a plurality of cylinders in the latter, pistons in said cylinders actuated by fluid-pressure, valves for controlling the movement of said pistons, a valve-chest for said valves, a chamber located adjacent said valve-chest in which the motive fluid is initially received, a throttle-valve of the piston type, adapted to reciprocate in said chamber, for enabling the operator to gradually admit the motive fluid to said cylinders, pinions on said shafts, a main gear rotatably supported in said casing and meshing with said pinions, a main-gear bushing, a thrust-washer, a stud against which said bushing and washer are adapted to contact, and means for operating said valves.

608,789. CYCLE-SADDLE. THOMAS J. KIRKPATRICK, Springfield, Ohio. Filed Nov. 22, 1897. Serial No. 659,442. (No model.)



Claim.—1. In a velocipede-saddle, a hollow tubular support curved at the center and formed at the ends with flattened sockets as described, independent front and rear springs each of a substantially circular form with projecting ends, the projecting ends of each spring being extended laterally and parallel to each other on a line which forms a secant to the inner circle of said spring, each of said springs being fitted at one end to the sockets in said base, and a seat connected to the remaining ends of said springs with the points of attachment in line with or outside of the inner circles of said springs extended, substantially as and for the purpose specified.

2. The combination with a seat, of independent front and rear springs for said seat, a hollow tubular support flattened at the ends and formed with sockets to receive the ends of said springs which are also formed flattened to correspond with said sockets, each of said springs being formed on the arc of a circle with the ends of the body on lines forming secants to said circle with the points of attachment of each of said springs to the base and seat respectively substantially over each other and on the outside or tangent to said circle, substantially as specified.

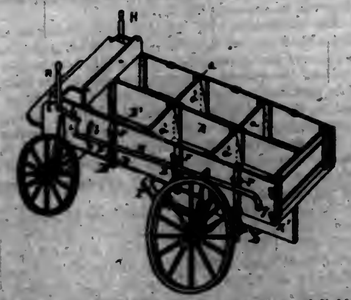
3. The combination with a hollow tubular base circular in cross-section and curved in the center as described, said base being expaged and flattened at the ends to form rectangular sockets, independent supporting-springs having circular bodies and laterally-projecting ends, one end of each of which is fitted to said sockets, a seat connected at each end to the ends of said supporting-springs with both of the supporting connections of each of said springs on lines forming secants to the circular bodies of said springs and substantially vertical over each other at the point on the outside of said circle, and a clamp fitted to the circular portion of said base, substantially as specified.

608,790. LAST. EDWIN O. KEMPLER and GEORGE A. KEMPLER, Detroit, Mich. Filed Sept. 21, 1896. Serial No. 606,504. (No model.)

Claim.—1. A last constructed of a front and rear portion having a movable engagement the one with the other, the meeting edge of one of said portions formed with diverging kerfs cut into the body of said portion toward the opposite end of said portion, and the meeting edge of the other portion provided with corresponding tongues having a movable engagement in said kerfs, and means to limit the movement of the front and rear portions the one with the other and to prevent their disengagement, substantially as described.

2. A last formed of a front and a rear portion, having a movable engagement the one with the other, one of said portions formed with laterally-diverging grooves, and the other portion with laterally-diverging tongues having a movable engagement in said grooves, substantially as described.

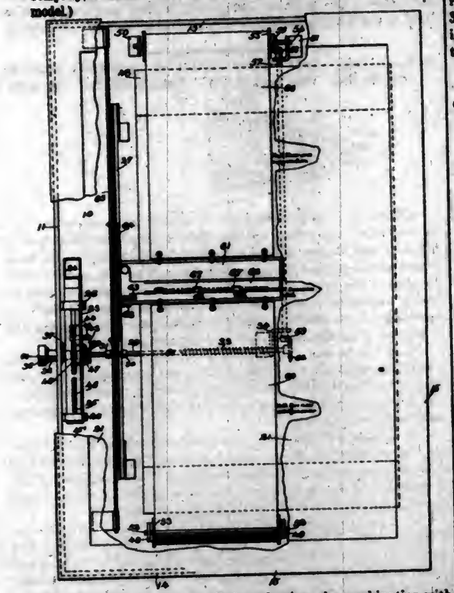
3. A last constructed with front and rear portions having a movable connection one with the other, one of said portions formed with diverging grooves, and the other portion provided with plates B^2, B^2, formed with diverging tongues to enter said grooves, and one of said plates formed with a recess b^2, for the purpose set forth.



4. A last constructed with front and rear portions having a movable connection one with the other, one of said portions formed with grooves and the other portion provided with plates B^2, B^2, one of said plates formed with an orifice, and with a recess b^2, the other of said portions formed with a tongue projecting through said orifice, for the purpose set forth.

5. A last consisting of front and rear portions, constructed with corresponding V-shaped meeting faces in cross-section, the meeting faces of one of said portions provided with plates having projecting tongues, and the meeting faces of the other of said portions having grooves to receive said tongues, substantially as described.

6. A last consisting of front and rear portions, having corresponding angular meeting faces in cross-section, the meeting faces of one of said portions provided with plates having projecting tongues, and the meeting faces of the other of said portions having grooves to receive said tongues, said grooves being formed in line with the plane of said meeting faces, substantially as described.



7. A last severed into front and rear portions by intersecting kerfs extending past the point of their intersection to form grooves in one of said portions, the opposite portion being provided with tongues movably engaged in said grooves, substantially as described.

608,791. DUMPING-WAGON. EDWARD P. LAMPSON, Harwich, Canada. Filed Sept. 22, 1897. Serial No. 652,771. (No model.) Patented in Canada July 16, 1897, No. 56,632.

Claim.—The combination with a wagon-box subdivided, each compartment having a hinged door or bottom A', the strap C, the link D, the bar B, and the link F, the long lever G pivoted by the bolt g, the oscillating link L, engaging with the forward end of the lever G, and the lower end of the arm A of the lever H its pivoted connection at N, the bracket b, the slot f, substantially as specified and hereinbefore set forth.

603,792. COIN-CONTROLLED MECHANISM. HORACE A. MARLEY, Boston, Mass., assignor to the Universal Advertising Machine Company, of Maine. Filed Mar. 19, 1896. Serial No. 583,892. (No model.)

Claim.—1. In a coin-controlled mechanism, the combination with a traveling plate, having a viewing-slot, and a shutter for closing the slot, of a coin-controlled device mounted in fixed bearings for actuating the shutter.

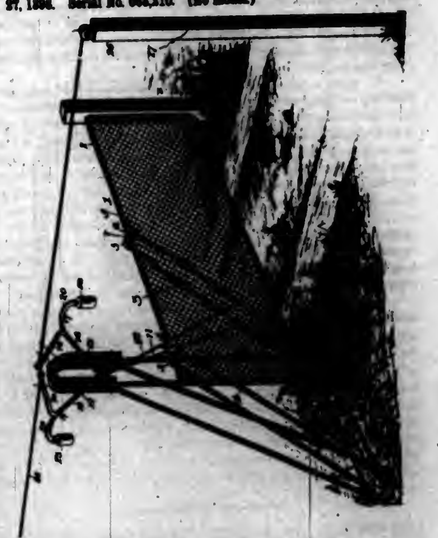
2. In a coin-controlled mechanism, a swinging rail on which a portion of the mechanism to be actuated is traversable and means for swinging the rail.

3. In a coin-controlled mechanism, the combination with a traveling mechanism provided with a portion to be actuated, and a swinging rail or gate with which such portion is engaged, of a coin-controlled mechanism, having means for swinging the gate.

4. In a coin-controlled mechanism, band-rollers, a band mounted thereon, a plate having a viewing-slot carried by the band, a shutter pivotally mounted on the plate, a swinging gate adapted to engage and operate the shutter, a coin-controlled device connected with one of the rollers for the purpose of transmitting rotation thereto, and connected with the gate to cause the same to swing, when desired.

5. The combination with a case containing matter to be viewed, band-rollers rotatable at the upper and lower portions of the case, a continuous band mounted on said rollers and including a portion having a viewing-slot, and a shutter working before said slot, of means for operating the belt, and a coin-controlled mechanism mounted in fixed bearings for actuating the shutter.

6. The combination with the band-rollers 53 and 55 rotatably mounted, a bevel-gear on the roller 55, the vertical shaft 57 mounted in bearings and having the gear 58, meshing with the gear on the roller 55, and the gear 59 at the lower portion of the shaft, and a rotatable shaft having a gear meshing with the gear 59, of a band mounted on the band-rollers and furnished with a viewing-slot, a shutter for closing the slot, and means for operating the shutter.



7. The combination with a door-frame 15 having the flange 16 furnished with the slot 17, and a pin 18, fitting said slot, and having the enlargements 19 and 20, of a panel adapted to be secured in place in the door-frame by said pin.

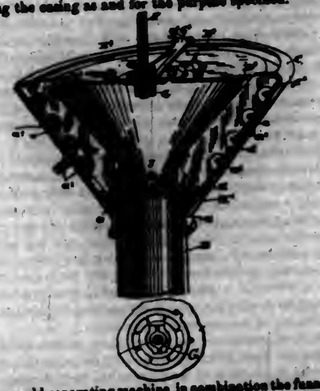
8. The combination with the shutter-plate 61 having viewing-slots and the opening 63, the yoke 64 secured to said plate, the vertical guide 65 on which the yoke is movable, and the shutter 66 pivoted on the shutter-plate, and having the member 68 working through the opening 64, and furnished with the slot 69, of the track 27, pivotally mounted within the case, the edge of which is engaged in the notch 69, and a coin-controlled mechanism adapted to swing said track.

9. The combination with the case, the shaft 29 rotatable in bearings and adapted to reciprocate, and having the members 30 and 31, the gate or rail 27 pivotally mounted and engaged by said members, the shaft passing through an opening in the gate, and a mechanism adapted to be operated by the swinging of the gate, of a coin-controlled mechanism for locking the shaft 29 from reciprocation.

10. The combination with the shaft 29 mounted to rotate and reciprocate, and having the members 36 and 39 with their portions 37 and 40, of the counterweight 44 pivoted above the shaft and having the locking-bolt 45, and the coin-lever 46, secured to the counterweight and having the bent portion 47.

603,798. GATE. DAVID MILLER, Garden City, Mo. Filed Jan. 27, 1896. Serial No. 577,210. (No model.)

Claim.—1. The combination with a gate, of oscillating bars arranged in pairs and supporting the gate, the converging guides arranged within one pair of the oscillating bars, converging downwardly and supporting the lower portion of the gate to hold the latter in proper position for closing, and operating mechanism, substantially as described.



2. The combination of a supporting-frame comprising vertical standards connected at their upper ends by a substantially U-shaped portion, inclined braces arranged in pairs and connected at their upper terminals by a U-shaped portion secured to the standards, and a substantially U-shaped horizontal base portion connecting the lower portions of the standards and the braces, oscillating bars mounted on the frame, a gate connected with the oscillating bars, and operating mechanism, substantially as described.

3. The combination of a supporting-frame comprising vertical standards connected at their upper ends by a substantially U-shaped portion, the inclined braces connected at their upper terminals by a vertical U-shaped portion secured to the standards and spaced therefrom to form guides, and the U-shaped piece 16 located at the opposite side of the standards and spaced from them to form guides, an oscillating gate, oscillating bars supporting the gate, and the levers fulcrumed on the supporting-frame, extending across the same and arranged in the said guides, said levers being connected with the oscillating bars, substantially as described.

603,794. GOLD-SEPARATING MACHINE. ARCHIBALD F. PERRY, Port Hope, Canada, assignor of one-half to Warren R. Sullivan, Alma, Mich. Filed May 10, 1897. Serial No. 635,926. (No model.)

Claim.—1. A gold-separating machine comprising an upper casing, cylindrical intake-pipe at the bottom thereof, a plurality of wings within the casing extending inwardly, a supplemental casing located and supported within the outer casing and forming an inner bounding end for the wings and an annular outlet at the top of the casing, and a shaft in the center of the casing and deriving a rotary movement from any suitable source of power as and for the purpose specified.

2. A gold-separating machine comprising an upper casing, cylindrical intake-pipe at the bottom thereof, a plurality of wings within the casing extending inwardly, a supplemental casing located and supported within the outer casing and forming an inner bounding end for the wings, an annular outlet at the top of the casing, and means for rotating the casing as and for the purpose specified.

3. In a gold-separating machine, in combination the funnel-shaped casing and intake-pipe extending upwardly below the bottom thereof, the receptacle formed in the casing around the top of the intake-pipe, the riffles extending around the interior of the funnel-shaped casing, the wings, the central hollow cone, the annular outlet between the cone and the outer casing and means for securing the cone to the outer casing and means for rotating the casing as and for the purpose specified.

4. In a gold-separating machine, in combination a funnel-shaped casing and intake-pipe extending from the bottom thereof, the riffles extending around the interior of the funnel-shaped casing, the wings, the central hollow cone, the annular outlet between the cone and the outer casing, the inwardly-extending flange at the top of the funnel-shaped casing and means for rotating the casing as and for the purpose specified.

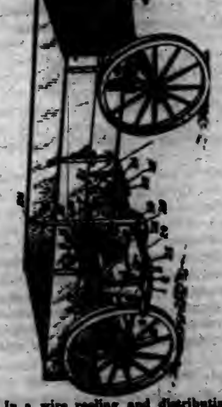
5. In a gold-separating machine, in combination a funnel-shaped casing and intake-pipe extending from the bottom thereof, the riffles extending around the interior of the funnel-shaped casing, the wings, the central hollow cone, the annular outlet between the cone and the outer casing, the grooved passage-way extending from the apex to the base of the cone, the inwardly-extending flange at the top of the funnel-shaped casing and means for securing the cone to the outer casing and means for rotating the casing as and for the purpose specified.

6. In a gold-separating machine, in combination a funnel-shaped casing and intake-pipe extending from the bottom thereof, the riffles extending around the interior of the funnel-shaped casing, the wings, the central hollow cone, the annular outlet between the cone and the outer casing, the grooved passage-ways extending from the apex to the base of the cone, the inwardly-extending flange at the bottom of the funnel-shaped casing, the guiding screens at the top of the intake-pipe, and means for securing the cone to the outer casing and means for rotating the casing as and for the purpose specified.

7. In a gold-separating machine, in combination a funnel-shaped casing and intake-pipe extending from the bottom thereof, the riffles extending around the interior of the funnel-shaped casing, the wings, the central hollow cone, the annular outlet between the cone and the outer casing, the inwardly-extending flange at the top of the funnel-shaped casing, the copper ring extending around the top of the casing underneath the flange and means for securing the cone to the outer casing and means for rotating the casing as and for the purpose specified.

8. In combination the outer casing, the intake-pipe, the riffles extending around the interior of the casing, the wings, the openings at the outer edges of the wings, the conical central portion of the casing, the annular outlet formed at the top of the casing and means for securing the cone to the outer casing and means for rotating the casing as and for the purpose specified.

9. In combination the outer casing, the intake-pipe, the riffles extending around the interior of the casing, the wings, the conical central portion of the casing, the annular outlet formed at the top of the casing, the shaft secured in a suitable sleeve, the arms extending outwardly therefrom and secured to the outer top edge of the casing and means for rotating such shaft as and for the purpose specified.



10. In combination the outer casing, the intake-pipe, the riffles extending around the interior of the casing, the wings, the conical central portion of the casing, the annular outlet formed at the top of the casing, means for connecting the central portion of the casing to the outer portion and openings in the apex and base of the central cone as and for the purpose specified.

603,795. SELF-SEALING BOTTLE. THOMAS W. EVAN, Cosford, Mass., assignor of one-half to James H. Walsh, Boston, Mass. Filed Mar. 6, 1897. Serial No. 626,202. (No model.)

Claim.—The bottle herein described provided with the seat, H, its neck, the vertical ribs, G, above said seat, and the shoulder, *p*, above said ribs in combination with the ball, F, engaging said seat and guided by said ribs; the hollow seal provided with the solid escalloped head, ports, C, a leg, E, and flange, *v*, for engaging said shoulder all being arranged to operate substantially as specified.

603,796. WIRE-REEL. ELI I. GRISWELL and JAMES BEERS, both of Davis City, Nebr. Filed May 17, 1897. Serial No. 636,970. (No model.)

Claim.—1. In a wire reeling and distributing apparatus, the combination with a revoluble spool-spindle, and means for operating the same, of a radially-armed stop revolubly fitted upon the spindle and having adjustable clutch-faces for frictionally engaging the surface of the spindle, adjusting devices for the clutch-faces, and a spool removably and revolubly fitted upon the spindle and provided with a terminal projection extending in a direction parallel with the spindle and engaging the armed stop exteriorly, substantially as specified.

2. In a wire-reeling apparatus, the combination with a spool and means for imparting rotary motion thereto, of guiding devices consisting of a pivotal arm of elastic or yielding construction adapted at its free end for yielding movement in a plane perpendicular to the axis of the spool, and a guide-pulley carried by the free end of said

arm and adapted to be traversed by a wire approaching the spool, whereby excessive strain upon the wire causes movement of the guide-pulley in a plane transverse to the axis of the spool, substantially as specified.

3. In a wire-reeling apparatus, the combination with a spool and means for imparting rotary motion thereto, of guiding devices having a movable arm constructed to yield in a plane perpendicular to the axis of the spool, a guide-pulley, and a swiveled frame 23 carried by the extremity of said arm and supporting the pulley for yielding movement substantially as specified.

4. In a wire-reeling apparatus, the combination with a base, fixed and movable standards mounted upon the base and supporting a spool-spindle, means for securing the movable standard at the desired adjustment, to expose the desired length of spool-spindle, and a spool removably fitted upon the spindle, of guiding devices including a pivotal yielding arm mounted upon the base, a guide-pulley supported by said arm, and adjustable stops arranged in the path of said arm, to limit its swinging movement to correspond with the length of the spool supported by the spindle, substantially as specified.

5. In a wire-reeling apparatus, the combination with a base, fixed and movable standards mounted upon the base and supporting a spool-spindle, means for securing the movable standard at the desired adjustment, to expose the desired length of spool-spindle, and a spool removably fitted upon the spindle, of guiding devices, including a pivotal yielding arm supporting a swiveled guide-pulley, a guide in which said arm operates contiguous to its pivot-point, stop-blocks arranged in said guide in the path of the arm and provided with longitudinal slots, bolts engaging said slots and adapted when tightened to secure the blocks at the desired adjustment, and thereby limit the swinging movement of the arm to suit the length of the spool, and means, including a hand-lever, pivotally mounted upon the fixed standard, for communicating oscillatory movement to said arm, substantially as specified.

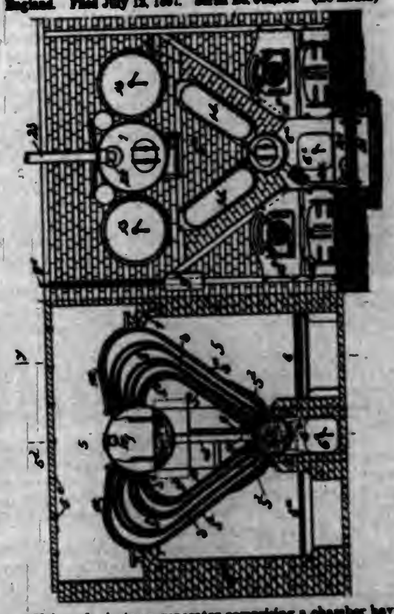
608,797. PROCESS OF EXTRACTING NICKEL FROM NICKEL ORES. THOMAS SCOBIE, Glasgow, Scotland. Filed June 12, 1897. Serial No. 640,574. (No specimens.)

Claim.—The process of treating New Caledonia nickel ores, and ores of similar composition, containing silicates or hydrated silicates of nickel, so as to obtain nickel salt in solution and a bright-red iron-oxid pigment, the said process consisting in mixing the ore with a solution of ferric chlorid, and heating the mixture in a closed vessel to a temperature of about 370° Fahrenheit under corresponding pressure, substantially as described.

608,798. HARROW. JOSEPH C. STUBBS, Aurora, Ill. Filed Sept. 20, 1897. Serial No. 652,277. (No model.)

Claim.—In a harrow the combination with a triangular frame provided with a central frame-bar, a circular tooth-frame provided with a hub and with radiating tooth-carrying arms and a concentric circular track provided with a series of apertures, a stud carried by the rotary tooth-frame and extending through the central frame-bar, and antifriction-rollers intermediate of the relatively-movable parts and means for securing them in their adjustable position, substantially as specified.

608,799. ILLUMINATING-LENS FOR SIDEWALKS. ROBERT J. SULLIVAN, River Forest, Ill., assignor to the Brown Brothers Manufacturing Company, Chicago, Ill. Filed Apr. 5, 1897. Serial No. 630,265. (No model.)



Claim.—1. An illuminating-lens comprising a hexagonal body portion and a leg projecting from the inner side thereof, said leg having a front flat face perpendicular or nearly so to the plane of the body portion which extends between two opposite side angles of the body portion with its center at a distance from the intermediate front angle of said body portion, the side surfaces of said leg being parallel with each other and in the same plane with the sides of the body portion while the rear surface of said leg is formed of a plurality of oblique facets which reach to the rear margins of said body portion, said body portion being provided between said front face of the leg and said front angle of the body portion with a flat surface parallel with the outer face of said body portion whereby rays of light may pass perpendicularly through the latter in front of the leg into the inclosed space to be illuminated.

2. An illuminating-lens comprising a body portion and a leg projecting from the inner side thereof, said leg having a flat front face perpendicular or nearly so to the plane of the body portion and, at its rear side, a central and two lateral, triangular facets, the central rear facet being arranged to extend across the leg the full width thereof and to intersect the front, flat face of said leg, at its outer extremity with its side margins converging upwardly and meeting midway between the side faces of the leg and the lateral triangular facets being arranged to intersect the central, triangular facet with its side margins converging toward and meeting at points at the side edges of the leg at the extremity of the same.

3. An illuminating-lens comprising a body portion and a leg projecting from the inner side thereof, said leg having a flat, front face perpendicular or nearly so to the plane of the body portion, two parallel, flat side faces, also perpendicular to the plane of the body portion and at its rear side, a central and two lateral, oblique, triangular facets; the side faces of the leg being of triangular form with their side margins converging to a point at the outer extremity of the leg, the central rear facet being arranged to extend across the leg the full width thereof and to intersect the front flat face of said leg at its outer extremity with its side margins converging upwardly and meeting midway between the side faces of the leg, and the lateral triangular facets extending between and intersecting the flat, triangular side faces of the leg and the said central triangular facet on lines which converge toward and meet at the extremity of the leg at the side edges of the same.

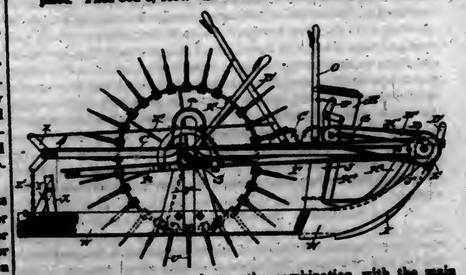
608,800. STEAM-GENERATOR. JOHN I. THORNYCROFT, London, England. Filed July 12, 1897. Serial No. 644,208. (No model.)

Claim.—1. A steam-generator comprising a chamber having its side, front and rear walls of solid refractory material and provided internally with a lower central setting or support, two upper and lateral closures, and two fire-grates arranged between the lower central setting and the side walls, a steam-drum extending through and carried by the front and rear walls of the chamber, a water vessel arranged below said steam-drum and carried by the lower central setting or support, two series of bent tubes 3 connecting the steam-drum and water vessel and arranged to form with these parts and the rear wall of the chamber a smoke-box and with the side walls of said chamber two fire-boxes located above said fire-grates, and downtake-tubes connecting said steam-drum and water vessel, the part of the rear wall of the chamber opposite the smoke-box being formed with an exit-passage for hot gases, substantially as described.

2. A steam-generator comprising a chamber having its side, front and rear walls of solid refractory material and provided with a lower central setting or support, two fire-grates located between opposite sides of said support and the side walls of said chamber, two upper removable closures carried by the said side walls, and an exit-opening in its rear wall, a steam-drum and water vessel arranged one above the other and transversely of the chamber, two series of bent tubes connecting said steam-drum and water vessel and inclined to each other so as to form with the steam-drum, water vessel and the front, back and side walls and roof of said chamber a central smoke-box opposite the exit-opening in the rear wall, two lateral fire-boxes above the fire-grates and an air or clearance space above the tubes and steam-drum, and downtake-tubes connecting said steam-drum and water vessel, substantially as described.

3. A steam-generator comprising a chamber or casing of solid refractory material, an upper steam-drum, lower water vessel and two series of bent connecting-tubes 3 extending transversely of said chamber and forming therewith a central smoke-box and two lateral fire-boxes, a lower central support for said water vessel and two fire-grates arranged at opposite sides thereof, said central support having a passage-way extending therethrough from the front of the generator to the rear of the smoke-box and provided with removable doors or closures, substantially as and for the purpose described.

4. A steam-generator comprising an upper steam-drum, a lower water vessel and two groups of bent tubes 3 connecting said steam-drum and water vessel, and a chamber or casing of solid refractory material surrounding said parts and forming therewith a central smoke-box and lateral fire-boxes, the front wall of said chamber being formed with openings arranged opposite the groups of tubes and normally closed by removable doors, substantially as and for the purpose described.



5. A steam-generator comprising a chamber or casing having its walls of solid refractory material, a steam-drum located in the upper part of said chamber or casing, a water vessel located in the lower part thereof, two series of bent tubes arranged to connect said water vessel to the upper part of said steam-drum separator and to form in conjunction with said steam-drum water vessel, and front and rear walls of said chamber or casing, a central smoke-box, some of the tubes of each series of tubes being arranged close together for the greater portion of their length to form inner and outer close tubulous walls of flues within which the other tubes of the series are placed and the tubes forming said outer wall being bent at their lower ends to form inlets to the bottoms of said flues and the tubes forming said inner wall being bent at their upper ends to form outlets from the top of said flue into said smoke-box, the front wall of said chamber or casing being formed with openings opposite the upper and lower portions of each of the flues formed by said tubes and provided with removable covers or doors that normally close said openings, substantially as and for the purpose described.

6. A steam-generator comprising an upper steam-drum, a lower water vessel and two groups of bent tubes 3 connecting said steam-drum and water vessel, and a chamber or casing of solid refractory material surrounding said parts and forming therewith a central smoke-box and lateral fire-boxes, the front wall of said chamber being built up of a metal frame 5°, filled in with brickwork 5ª and formed with openings located opposite the upper and lower portions of the groups of tubes and with firing and ash-pit openings, detachable covers or doors 13 and 14 normally closing the first-mentioned openings and secured to the metal frame 5°, and plates 15ª 16ª also secured to said metal frame and provided with doors 15 and 16 respectively for closing the firing and ash-pit openings, substantially as described.

7. Steam-generating plant comprising a structure of solid refractory material formed with a plurality of chambers and with a flue that is common to all the chambers and is connected to each of them by an exit-passage in the rear wall thereof, each chamber being provided with a lower central support, two fire-grates at opposite sides thereof, and upper lateral closures, a plurality of steam-generating units arranged one in each of said chambers and comprising a steam-drum and water vessel arranged one above the other and two series of bent tubes connecting said steam-drum to said water vessel, touching said upper lateral closures and inclined to each other so as to form with these parts and the sides, front and rear walls of the surrounding chamber a central smoke-box and two lateral fire-boxes, dampers adapted to control said exit-passages, means for separately operating said dampers, a main steam-supply pipe common to all the steam-drums, branch pipes with stop-valves between said steam-pipe and each of said steam-drums, a main blow-off pipe common to all the water vessels, and branch pipes with valves between said blow-off pipe and each of said water vessels, substantially as described.

8. Steam-generating plant comprising a brickwork structure formed with a number of independent chambers 5 arranged in a straight row, a longitudinal flue 9ª at the back of said chambers and having its roof arranged to form a platform behind the upper portions of said chambers, and a number of openings 9 connecting said flue with the rear ends of said chambers, each of said chambers being provided with a lower central support 6 having a normally-closed passage extending therethrough from the exterior of the chamber to the inner rear end thereof, two fire-grates arranged at opposite sides of said central support, and upper removable lateral closures 7, 7ª, a plurality of steam-generating units located in said chambers and each comprising an upper steam-drum, a lower water vessel resting on said central support and two series of bent tubes 3 connecting said steam-drum and water vessel, in contact with said lateral closures and arranged to form with the steam-drum and water vessel and the walls of the chamber in which they are placed, a central smoke-box and two lateral fire-boxes, a main steam-pipe, separate branch pipes with valves connecting said steam-pipe to each of the steam-drums, a main blow-off pipe, and branch pipes with valves connecting said blow-off pipe to each of the water vessels, all substantially as described and shown.

608,801. CORN-PLANTER. JOSEPH URBANEK, Schuyler, Nebr., assignor of two-thirds to Thomas B. Molesek and Morris Palmer, same place. Filed Oct. 9, 1897. Serial No. 654,653. (No model.)

Claim.—1. In a corn-planter, the combination, with the main frame, of a hinged or floating frame flexibly connected thereto, a toothed wheel mounted in said floating frame, a shoe or runner extending longitudinally of the machine and serving to support said hinged frame, and a driving connection between said toothed wheel and the dropping devices of the machine, substantially as described.

2. In a corn-planter, the combination, with the main frame of the machine, of a hinged or floating frame within the main frame and flexibly connected thereto, a runner or shoe extending longitudinally of the machine beneath said hinged frame and serving to support the latter, a toothed wheel mounted in the hinged frame and having its teeth projecting through said shoe or runner to engage the ground beneath the same, and a driving connection between said toothed wheel and the dropping devices of the machine, substantially as described.

3. In a corn-planter, the combination, with the main frame of the machine, of a floating frame within said main frame and flexibly connected thereto, a rotary shaft journaled in said floating frame, a shoe or runner hung upon said shaft beneath said floating frame and extending from front to rear of the machine, a toothed wheel fast upon said shaft, and a driving connection between said shaft and the dropping devices of the machine, substantially as described.

4. In a corn-planter, the combination, with the main frame of the machine, of a hinged or floating frame connected thereto, a toothed wheel mounted in said floating frame, a shoe or runner extending longitudinally of the machine beneath said frame and serving to support the latter, means for adjusting said wheel and runner vertically in relation to each other, to permit the teeth of the wheel to project a greater or less distance below the runner, and a driving connection between said wheel and the dropping devices of the machine, substantially as described.

5. In a corn-planter, the combination, with the main frame of the machine, of a hinged or floating frame connected thereto, a toothed wheel mounted in said floating frame, a shoe or runner hung to said frame beneath the same and extending longitudinally of the machine and serving to support said frame, means upon the main frame for adjusting the floating frame and runner vertically in relation to the main frame, and a driving connection between the toothed wheel and the dropping devices of the machine, substantially as described.

6. In a corn-planter, the combination, with the main frame of the machine, of a hinged or floating frame connected thereto, a toothed wheel mounted in said floating frame, a shoe or runner extending longitudinally of the machine beneath said frame and hung to the latter

at a point beneath the axis of the toothed wheel, and having its forward end left free for limited vertical movement independently of the floating frame, and a driving connection between the toothed wheel and the dropping devices of the machine, substantially as described.

7. In a corn-planter, the combination, with the main frame, and the seedbox and runner-frame hinged thereto and the draft-tongue rigidly connected to such seedbox and runner-frame, of a hinged or floating frame located in rear of the seedbox and runner-frame and flexibly connected to the main frame, a toothed wheel mounted in said floating frame, and a driving connection between said toothed wheel and the dropping devices of the machine, a shoe or runner extending longitudinally of the machine beneath said floating frame and hung to the latter at a point beneath the axis of the toothed wheel, a connection between the front end of said shoe or runner and the draft-tongue of the machine which permits limited vertical movement of the front end of the shoe independently of the tongue, and means upon the main frame for lifting the seedbox and runner-frame and thereby causing the draft-tongue to lift the front end of said shoe or runner, and for also lifting the rear end of said runner or shoe, to elevate said runner and the toothed wheel above the surface of the ground, substantially as described.

8. In a corn-planter, the combination, with the main frame and the seedbox and runner-frame hinged thereto and the draft-tongue rigidly connected to such seedbox and runner-frame, of a hinged or floating frame located in rear of the seedbox and runner-frame and flexibly connected to the main frame, a toothed wheel mounted in said floating frame, and a driving connection between said toothed wheel and the dropping devices of the machine, a shoe or runner extending longitudinally of the machine beneath such floating frame and hung to the latter at a point beneath the axis of the toothed wheel, a connection between the front end of such shoe or runner and the draft-tongue of the machine which permits limited vertical movement of the front end of the shoe independently of the tongue, a lever and connections upon the main frame for lifting the seedbox and runner-frame and thereby causing the draft-tongue to lift the front end of said shoe or runner, and a second lever and connections for lifting the rear end of said shoe or runner, substantially as described.

9. In a corn-planter, the combination, with the main frame, of a hinged or floating frame flexibly connected thereto, a shoe or runner extending longitudinally of the machine beneath such floating frame and serving to support the latter, a toothed wheel mounted in the floating frame, a driving connection between said wheel and the dropping devices of the machine, and adjusting means in said driving connection for regulating the action of the dropping devices, substantially as described.

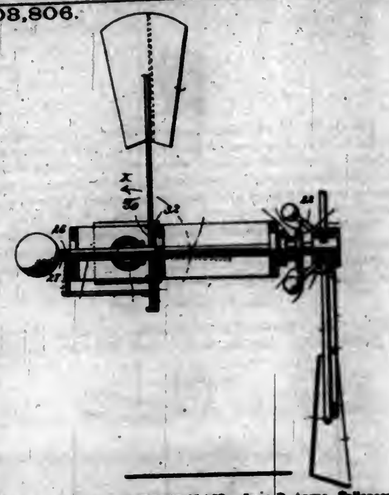
10. In a corn-planter, the combination, with the main frame of the machine, of a floating frame flexibly connected thereto, a shoe or runner extending longitudinally of the machine beneath said floating frame and serving to support the latter, a rotary shaft mounted in the floating frame, a sprocket-wheel upon said shaft, driving connections between said sprocket-wheel and the dropping devices of the machine, and a clutch between the sprocket-wheel and shaft whereby the wheel may be disconnected from the shaft and adjusted about the latter and reconnected to it at will to regulate the action of the dropping devices, substantially as described.

11. In a corn-planter, the combination, with the main frame of the machine, of a floating frame flexibly connected thereto, a shoe or runner extending longitudinally of the machine beneath said floating frame and serving to support the latter, a rotary shaft mounted in the floating frame, a sprocket-wheel upon said shaft, driving connections between said sprocket-wheel and the dropping devices of the machine, a friction-clutch intermediate the sprocket-wheel and shaft, and a lever controlling said clutch, substantially as and for the purpose described

12. In a corn-planter, the combination, with the main frame A having the front rod B, of the floating frame R hung at its front end upon the rod B, the shoe or runner W extending from front to rear of the machine along the middle line thereof beneath the floating frame R and serving to support the latter, the wheel T mounted in the frame R and having the teeth U projecting through the runner W, and a driving connection between the wheel T and the dropping devices of the machine, substantially as described.

13. In a corn-planter, the combination, with the main frame A having the front rod B, of the floating frame R hung at its front end upon the rod B, the shoe or runner W extending from front to rear of the machine along the middle line of the latter beneath the frame R and serving to support said frame, the rotary shaft S journaled in the frame R, the sprocket F upon said shaft, the two sprockets J' L' turning together upon the rod B, the chain I' connecting the sprockets F' and J', the rotary shaft O' having the sprocket N' fast upon it, the chain M' connecting the sprockets L' and N', and the dropping devices of the machine actuated by the shaft O', substantially as described.

14. In a corn-planter, the combination, with the main frame A having the front rod B, of the floating frame R hung at its front end upon the rod B, the shoe or runner W extending from front to rear of the machine along the middle line of the latter beneath the frame R and serving to support said frame, the rotary shaft S journaled in the frame R, the sprocket F' upon said shaft, the clutch O' between the sprocket F' and shaft S and the lever E' controlling said clutch, the sprocket J' L' turning together upon the rod B, the rotary shaft O' sprocketed J' L' turning together upon the rod B, the rotary shaft O' sprocketed J' L' turning together upon the rod B, the rotary shaft O' sprocketed



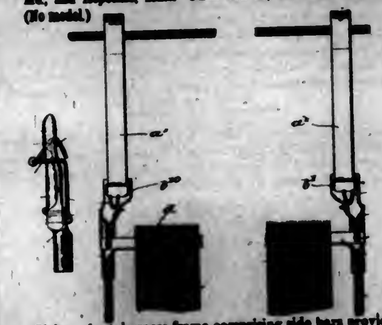
7. In a rotary pump, the combination with the gas-chamber, of gas-compressing devices, an actuating-shaft therefor, a bearing for said shaft in one wall of said chamber having a countersunk or tapered mouth adapted to cooperate with an annular tapered shoulder or enlargement on the said shaft, a bearing for the said shaft in the opposite wall of said chamber, an oil-chamber inclosing said bearing and itself provided with a packed supplemental bearing for the said shaft, the sectional area of said shaft where it passes through said supplemental bearing being less than the sectional area thereof at the main bearing, whereby a certain area is subjected to unbalanced pressure of gas which may have escaped into the oil-chamber, said pressure tending to move the said shaft longitudinally and bring the annular shoulder thereof into engagement with the annular mouth of the bearing at the opposite end, substantially as and for the purpose described.

8. The combination with a casing having an interior closed gas-chamber, of an annular gas-chamber formed in said casing and surrounding the said interior chamber, a series of plunger-chambers extending from one of said gas-chambers to the other, a plunger adapted to reciprocate in each plunger-chamber, a shaft extending through the interior gas-chamber and having an eccentric mounted thereon, a ring or float surrounding the said eccentric and adapted to cooperate with the plungers aforesaid to produce the reciprocatory movement thereof, antifriction devices interposed between said eccentric and said ring, a valve in each plunger adapted to be open during the movement of said plunger in one direction and to be closed during the movement thereof in the opposite direction, and a valve interposed between each plunger-chamber and one of the said gas-chambers adapted to be open during the movement of the plunger toward the same and to be closed during the movement of the plunger in the opposite direction, substantially as described.

9. In a rotary pump, the combination with a cylindrical shell having a longitudinal opening through the middle, of an annular closed chamber formed in the said shell and surrounding the said opening, a series of plunger-chambers extending from the said opening to the said annular chamber, a plunger in each plunger-chamber, a valve in each plunger to permit gas to pass in one direction but not in the other, a valve controlling communication between the plunger-chamber and the gas-chamber toward which the plunger moves in its operative stroke, a shaft having an eccentric cooperating with said plungers, the said shaft extending through the opening in the shell, bonnets for the ends of the shell having bearings for the shaft, the said bonnets closing the opening in the shell so that the said opening and bonnets constitute a closed gas-chamber; and gas-passages communicating respectively with said closed gas-chamber and the annular chamber aforesaid, substantially as described.

10. In a rotary pump, a casing having an interior closed gas inlet chamber, of a gas-outlet chamber surrounding the said inlet-chamber and also formed in the casing, a bore or opening extending from the outside of the casing through the gas-outlet chamber to the gas-inlet chamber, a bushing inserted in said bore, an annular valve-seat in said bushing, an opening in said bushing above said valve-seat to afford communication with the gas-outlet chamber, a valve cooperating with said seat, a bonnet secured to the outside of the casing to hold the said bushing in place, a spring interposed between said bonnet and said valve, a plunger fitting said bushing, the face of said plunger being adapted to engage and lift the said valve, means for reciprocating said plunger, an opening in said plunger controlled by a valve adapted to be open during the movement of said plunger toward the inlet-chamber and closed during the movement thereof toward the outlet-chamber, an inlet to the inlet-chamber and an outlet from the outlet-chamber, substantially as described.

608,806.



608,807. BUDDING-CLASP. JOHN D. ABELL, Tallapoosa, Ga. Filed Sept. 24, 1897. Serial No. 652,881. (No model.)

Claim.—The herein-described budding-clasp, consisting of a strip of metal flattened at its central portion to form a wide bearing-surface for covering the scion or bud, the end portions of said clasp being adapted to have their extremities interlocked or hooked together, substantially as described.

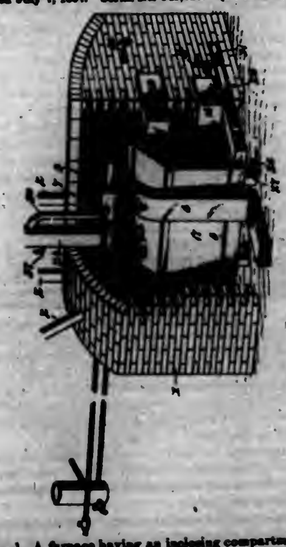
608,808. LOCKING-CLAMP FOR HEDDLE-BARS. MIRIAM J. ARMSTEAD, Lowell, Mass., assignor to the Draper Company, Portland, Me., and Hopedale, Mass. Filed Oct. 18, 1897. Serial No. 655,594. (No model.)

Claim.—1. A harness-frame comprising side bars provided with seats, a detachable heddle-bar adapted to be supported by the seats, and locking-clamps to retain said bar in place, said clamps having each an open body to embrace the side bar, a flexibly-attached retaining-tongue to engage the heddle-bar, and a spring-latch pivotally mounted on the body of the clamp to engage the side bar.

2. A harness-frame comprising side bars provided each with a transverse open seat and an adjacent aperture, a detachable cross-bar having registering openings and adapted to be supported on said seats, combined with locking clamps having open bodies to loosely embrace the side bars, retaining-tongues fixed on said bodies to enter the openings in the side and cross bars, and retain the cross-bar in place, and a pivotally-mounted latch on each clamp-body, to hold the latter in place on its side bar.

3. A harness-frame comprising upright, apertured side bars provided with stirrups at their upper ends, a clamp mounted on each and including an open body provided with a retaining-tongue, and an oppositely-turned hook-shaped spring-latch pivotally mounted on the body, and a detachable heddle-bar having apertures to register with the apertures of the side bars, the tongues of the clamps entering the apertures of the side bars and heddle-bar, and being held in place by the latches extended into the stirrups.

4. A harness-frame comprising upright side bars having upper and lower openings therein, a detachable heddle-bar having apertures to register with the lower openings of the side bars, and a clamp removably mounted on each side bar, each clamp comprising a body having a bent tongue at its lower end to enter the registering openings of the side and heddle bars, and a spring-latch pivotally mounted on the upper end of the body, to enter the upper opening of the side bar and thereby hold the clamp in position and prevent withdrawal of the tongue.



608,806. WINDMILL. ANTON SWIEBEL, Burlington, Wis. Filed June 13, 1896. Serial No. 596,225. (No model.)

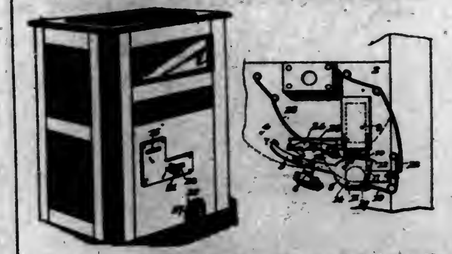
Claim.—1. In a windmill having its wheel-shaft geared with a vertical operating-shaft, the combination with the turn-table, of a vane extending at right angles to the wheel-shaft with its edge to the wind, and means whereby the "creeping" of the turn-table will turn said vane-face to the wind, substantially as described.

2. In a windmill having its wheel-shaft geared with a vertical operating-shaft, the combination with a pivoted main vane lying normally in alinement with the wheel-shaft, of an auxiliary vane at right angles thereto edgewise to the wind, and connections between the two vanes for causing pressure on one side of the main vane to turn the auxiliary-vane face to the wind, substantially as described.

3. In a windmill having its wheel-shaft geared with a vertical operating-shaft, the combination with the pivoted main vane normally in alinement with the wheel-shaft, of an auxiliary vane at right angles thereto with its edge to the wind, crank-arms on the shafts of said vanes and link connecting them whereby undue wind-pressure on one side of the main vane will turn the auxiliary-vane face to the wind, substantially as described.

608,809. HOT-AIR FURNACE. ALFRED R. BLAIR, Prostburg, Md. Filed July 7, 1897. Serial No. 643,726. (No model.)

Claim.—1. A furnace having an inclosing compartmental casing interiorly divided by a transverse vertical partition 3, the furnace, proper, extending in front and in rear of the plane of said partition, and having its fire-box in communication directly and indirectly with a flue extending through the rear compartment of the casing, and said furnace also having a dome covering its fire-box, an air-supply conductor extending from a point outside of the casing contiguous to the bottom of the furnace, and terminating in an outlet located within the casing contiguous to and in front of said partition, and an open-topped moisture-distributing reservoir arranged above the furnace in rear of and contiguous to the plane of the partition and between the same and said flue, and provided with suitable supply and relief conductors, the reservoir being located above the rear portion of the furnace, proper, contiguous to the dome thereof, substantially as specified.



2. A furnace having an inclosing casing forming air-chambers and distributing-pipes in communication therewith, the furnace, proper, being provided with side and bottom radiating-surfaces, and means for supplying air, including a conductor entering the casing at its bottom, extending upward out of contact with said radiating-surfaces and discharging above the furnace, proper, substantially as specified.

3. A furnace having an inclosing casing provided with supply and distributing conveyers, the furnace, proper, comprising a combustion-chamber and an inclosing drum communicating directly and indirectly with a smoke-flue, said drum having a domed shell forming radiating-surfaces, a base and a spaced subbase forming connected conductors in communication with a smoke-flue, and draft-spaces between the walls of the combustion-chamber and the walls of the shell, substantially as specified.

4. A furnace having an inclosing casing provided with supply and distributing conveyers, the furnace, proper, comprising an open-topped fire-box, a drum having a base supporting the fire-box and forming the floor of an ash-pit under the fire-box, a drum-shell supported by the said base and surrounding the fire-box with its walls spaced therefrom, the interior of the shell being in communication by a direct-draft opening with a smoke-flue, and said drum also having a subbase spaced from the base and divided by interior partitions to form a central conductor, in communication with the smoke-flue below said direct-draft opening, said side conductors in communication with the side spaces between the fire-box and the walls of the shell, and connected with the central conductor at points remote from the smoke-flue, substantially as specified.

5. A furnace having an inclosing casing provided with supply and distributing conveyers, the furnace, proper, comprising an open-topped fire-box, a base supporting the fire-box and forming the bottom of the ash-pit therefor, said base being of greater area than the fire box, a subbase spaced from the base and having the intervening interval divided by partitions to form a central conductor and side conductors communicating with the central conductor at their front ends, a shell supported by the base with its sides spaced from the walls of the fire-box, to form chambers communicating through openings in the base with said side conductors, a smoke flue communicating with the rear end of the central conductor, a dampered direct-flue opening connecting the interior of the shell above the fire-box with the smoke-flue, a draft-damper in the smoke-flue above the plane of the direct-draft opening, and a gas-escape tube connecting the interior of the shell with the smoke-flue above the draft-damper, substantially as specified.

608,810. COIN-OPERATED VENDING APPARATUS. JAMES R. BOWLING and GEORGE W. GILLILAND, Herodosia, Ill. Filed Oct. 23, 1897. Serial No. 656,165. (No model.)

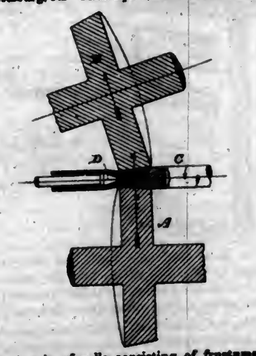
Claim.—1. In an apparatus of the class described, the combination of a casing, a wheel journaled within the same and provided at its periphery with pockets adapted for the reception of cigars, coin-operated mechanism for actuating the wheel, and a frame resting upon the wheel, and guided in the casing and adapted to direct cigars into the pockets, substantially as and for the purpose described.

2. In an apparatus of the class described, the combination of a casing, a wheel journaled within the same and provided at its periphery with pockets adapted for the reception of cigars, coin-operated mechanism for actuating the wheel, and an oblong frame resting upon the wheel, provided at one end with a rigid inclined wall and having at its other end a hinged wall disposed at an inclination, said oblong frame being guided in the casing, substantially as described.

3. In an apparatus of the class described, the combination of a wheel having pockets and provided at one of its faces with projecting pins, a lever fulcrumed between its ends, having one end engaging the pins of the wheel and adapted to have its other end engaged by a coin to release the wheel, and a push-bar adapted to engage the coin and carry the same into engagement with the lever, said push-bar being provided with means for actuating the wheel when the lever is thrown out of engagement with the same, substantially as described.

4. In an apparatus of the class described, the combination of a wheel provided at one of its faces with projecting pins, a lever engaging one of the pins of the wheel and provided with a lateral projection arranged to be engaged by a coin, whereby the lever is swung away from the wheel, and a push-bar adapted to actuate the wheel and provided with a pin or projection for engaging the coin to carry the same into contact with the projection of the lever, substantially as described.

5. In an apparatus of the class described, the combination of a wheel provided with pockets, a lever engaging the wheel and locking the same against rotation, and a push-bar provided with means for actuating the wheel and arranged to carry a coin into engagement with the lever, whereby the latter is carried away from the wheel to release the same, substantially as described.



6. In an apparatus of the class described, the combination of a casing having a coin-chute, a wheel mounted within the casing and provided with pockets, a push-bar mounted at the lower end of the coin-chute and provided with a pawl for engaging the wheel, and a lever fulcrumed between its ends, engaging the wheel at one end and having its other end arranged at the lower end of the coin-chute, adjacent to the push-bar, to receive a coin between it and the same,

said lever being provided with means for throwing it out of engagement with the wheel when it is engaged by a coin, substantially as described.

7. In an apparatus of the class described, the combination of a casing, a wheel provided with pins at one of its faces, a coin-chute, a lever fulcrumed between its ends, engaging one of the pins and provided at its other end with a projection adapted to be engaged by a coin, a push-bar spaced from the lever and adapted to carry a coin into engagement with the said projection, springs for returning the push-bar to its initial position and for holding the lever normally in engagement with the wheel, and a spring-pressed pawl pivotally mounted on the push-bar and engaging one of the pins of the wheel for rotating the latter, substantially as described.

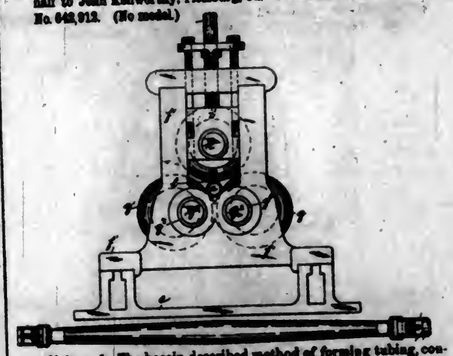
8. In the apparatus of the class described, the combination of a casing, a coin-chute, a wheel, a plate arranged at the bottom of the coin-chute and provided with a horizontal flange for supporting a coin, a push-bar adapted to engage the wheel and provided with means for advancing the coin, and a lever locking the wheel against rotation, provided with a projection to be engaged by a coin and having a stop normally bearing against the plate, substantially as described.

608,811. TUBE-MAKING MACHINE. JOHN A. CHARNOCK, Cleveland, Ohio, assignor, by mesne assignments, to the Shelby Steel Tube Company, Pittsburg, Pa. Filed Apr. 5, 1897. Serial No. 630,732. (No model.)

Claim.—1. A pair of rolls consisting of frustums of cones, arranged on opposite sides of a pass and revolving in the same direction, the larger diameter of each roll being opposed to the smaller diameter of the other roll substantially as set forth.

2. A pair of rolls consisting of frustums of cones arranged on opposite sides of a pass and revolving in the same direction, the larger diameter of each roll being opposed to the smaller diameter of the other roll, the rolls being so located that the pass between their opposed faces gradually diminishes in width toward its exit side as set forth.

3. A pair of rolls consisting of frustums of cones arranged on opposite sides of a pass and revolving in the same direction, the larger diameter of each roll being opposed to the smaller diameter of the other roll, the axes of the rolls being oppositely inclined relatively to the axis of the pass substantially as and for the purpose set forth.



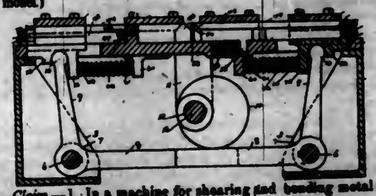
4. A pair of rolls consisting of frustums of cones arranged on opposite sides of a pass and revolving in the same direction, the larger diameter of each roll being opposed to the smaller diameter of the other roll, the pass between the rolls gradually diminishing in width toward its exit end and the axes of the rolls being oppositely inclined relatively to the axis of the pass substantially as and for the purpose set forth.

5. The combination of a pair of rolls consisting of frustums of cones arranged on opposite sides of a pass and revolving in the same direction, the larger diameter of each roll being opposed to the smaller diameter of the other roll, the axes of the rolls being oppositely inclined relatively to the axis of the pass and the pass gradually diminishing in width toward its exit side, a conical piercing-mandrel located in the axial line of the pass with its point at or near the exit side thereof, substantially as set forth.

6. The combination of a pair of rolls consisting of double frustums of cones arranged on opposite sides of a pass and revolving in the same direction, the entrance side of the pass being gradually diminished in width and bounded by sections of the rolls in which the larger diameter of each is opposed to the smaller diameter of the other, the exit side of the pass being gradually increased in width and bounded by prolongations of the rolls consisting of frustums of cones, a conical piercing-mandrel located in the exit side of the pass and in axial line therewith with its point at or near the narrowest part of the pass, with the axes of the rolls oppositely inclined relatively to the axis of the pass substantially as and for the purpose set forth.

7. A pair of rolls arranged on inclined axes and each having an inclined working surface with a pass between them, the larger diameter of the working surface on each roll being opposed to a smaller diameter of the working surface on the other roll, substantially as set forth.

608,812. METHOD OF AND APPARATUS FOR MANUFACTURING TUBING. THOMAS COATES, Youngstown, Ohio, assignor of one-half to John Kenworthy, Pittsburg, Pa. Filed June 30, 1897. Serial No. 643,913. (No model.)



Claim.—1. The herein-described method of forming tubing, consisting in filling a blank or section of tubing with fluid air under pressure, and then applying pressing means to the blank or tubing to reduce or taper the same, substantially as described.

2. The herein-described method of forming tubing, consisting in filling a blank or section of tubing with fluid air under compression, and then rolling the blank or tube in rolls to reduce or taper the same, substantially as described.

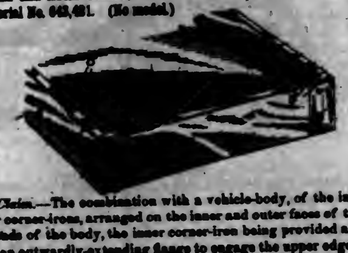
3. In apparatus for making tubing, the combination of a blank or section of tubing having fluid air therein under pressure, and a check-valve on the end of said blank or tubing, substantially as and for the purposes set forth.

4. In apparatus for making tubing, the combination of a blank or section of tubing having fluid air therein under pressure, a check-valve on one end of said blank or tubing, and a safety-valve on the opposite end thereof, substantially as and for the purposes set forth.

608,813. MACHINE FOR SHEARING AND BENDING METAL. ROBERT B. DANIELS, Youngstown, Ohio, assignor of one-half to Hiram Hulbert, same place. Filed July 30, 1897. Serial No. 645,573. (No model.)

Claim.—1. In a machine for shearing and bending metal as described, the former-blocks, the dies and clamps, means for actuating the said dies and clamps intermittently, and means for feeding the material between the said dies and clamps and said former-blocks intermittently, substantially as and in the manner described.

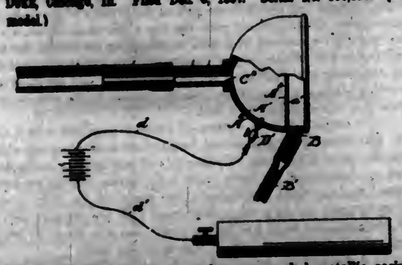
2. In a machine for shearing and bending metal, the former-blocks and the dies and clamps arranged in diagonal pairs, means for actuating the said dies and clamps intermittently, and means for intermittently feeding the material between the said former-blocks and the said dies and clamps, substantially as and in the manner described.



3. In a machine for bending and shearing metal strips, former-blocks secured oppositely diagonal upon a table, the sliding carriages mounted upon said table, means for reciprocating the said carriages, the dies and hammer-blocks secured to said carriages, the reciprocating clamping-bar actuated by the said hammer-block, the feed-wheels adapted to feed the material between the dies and the former-blocks, combined with means for intermittently actuating the said feed-wheels, substantially as described.

4. In combination with a bed, the sliding carriages mounted thereon, the dies and hammer-bars secured in said carriages, the reciprocating clamping-bar actuated by the said hammer-bar, the former-blocks secured to the table, the cranks journaled to a rocking shaft and actuating the said carriages, the cams actuating the said bell-cranks, the feed-wheels, the ratchet of one of the said feed-wheels, the pawl engaging the said rack, the pitmen and crank-arm actuating the said pawl, the said crank-arm being keyed to the before-mentioned rocking shaft and means for rotating the cams, all substantially as and for the purpose described.

5. In combination with the bed, the carriages, the dies and hammers thereof, the clamping-bars, the former-blocks, means for reciprocating the said carriages, means for adjusting the said dies, the hammer-bars and the former-blocks, and mechanism for feeding the material to the said dies and former-blocks, substantially as and for the purpose described.

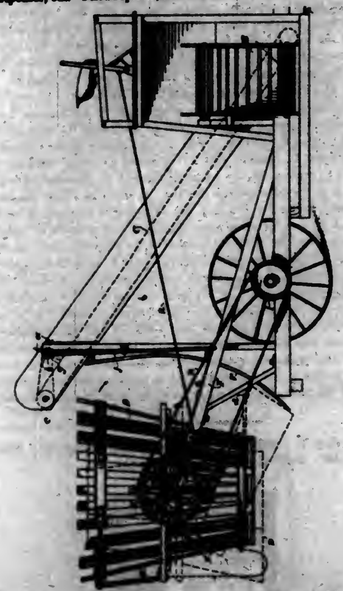


6. In combination with the bed, the carriages, the dies and hammers thereof, the clamping-bars, the former-blocks, means for reciprocating the said carriages, means for adjusting the said dies, the hammer-bars, and the former-blocks, and means for feeding the material comprising feed-wheels, a spring impinging one of said wheels upon the other, the ratchet of the latter wheel, the pawl engaging the said ratchet, the box in which said pawl is pivoted and the spring of said box, the pitmen pivoted to the said box, and pivoted to a crank-arm, the said crank-arm, and means for intermittently actuating the same, substantially as and for the purpose described.

608,814. CORNER-IRON FOR VEHICLE-BODIES. JOHN W. DURHAM and ADAM RILLIE, North Baltimore, Ohio. Filed July 3, 1897. Serial No. 643,491. (No model.)

Claim.—The combination with a vehicle-body, of the inner and outer corner-irons, arranged on the inner and outer faces of the sides and ends of the body, the inner corner-iron being provided at its top with an outwardly-extending flange to engage the upper edges of the body, and the outer corner-iron being provided at its lower end with an inwardly-extending flange to fit against the bottom of the body, said inner and outer corner-irons being vertically adjustable to vary the distance between the said flanges to suit wagon-bodies of different heights, and means for connecting the corner-irons, substantially as described.

608,815. ELECTROTHERAPEUTIC APPARATUS. GERVASE G. DUKE, Chicago, Ill. Filed Dec. 6, 1897. Serial No. 660,857. (No model.)



Claim.—1. The combination of an open-ended metallic casing provided with a jet or jets or orifices and with a marginal flange of insulating material, an outlet-tube leading from said casing inside of said flange and a primary battery or other source of electrical supply, one terminal of which is electrically connected with said metallic casing and the other terminal of which is provided with an electrode.

2. The combination with a metallic casing provided with a perforated diaphragm and an insulated marginal flange, an outlet-passage opening from said casing outside of said diaphragm, and a primary battery or other source of electrical supply, one terminal of which is connected with said metallic casing and the other terminal of which is provided with an electrode.

3. An open-ended casing provided adjacent to its open end with a perforated diaphragm, with an inlet-tube opening into said receptacle behind said diaphragm, and with an outlet-tube leading therefrom between said diaphragm and the outer margin of the casing.

608,816. HAY-COCKING MACHINE. WILLIAM H. FRAMER, Montpelier, Cal. Filed Sept. 13, 1897. Serial No. 651,441. (No model.)

Claim.—1. The combination in a hay-cocking machine of the sickle-carrying belts or drapers and a normally vertically disposed basket suspended upon trunnions so as to receive the grass discharged from the carrying-belt, said basket having a side loosely pivoted at the top whereby the bottom is allowed to press upon the contents of the basket by gravitation as the basket revolves, a pulley loosely mounted upon the trunnion-shaft, a ratchet-wheel carried by the pulley, a spring-pressed lever-arm connected with the trunnion-shaft having a lug adapted to engage with the ratchet, a latch whereby the lever is raised and the lug maintained normally out of engagement with the ratchet-teeth, and a device within the control of the driver by which the lever may be disengaged from the latch and allowed to engage the ratchet whereby it and the trunnion-shaft are rotated and the basket reversed and discharged.

2. A vertically-disposed basket mounted upon a trunnion-shaft and adapted to receive grass which is delivered from the sickle of a mowing-machine, said basket having a side loosely pivoted at the top whereby the bottom is allowed to press upon the contents of the basket by gravitation as the said basket revolves, a pulley loosely turnable upon the trunnion-shaft and continuously rotated by connection with a movable part of the main machine, a ratchet-wheel carried by said pulley, an arm extending across and connected with the basket-trunnion, a spring-pressed lever having one end hinged to said arm and a lug upon the lever adapted to engage with the ratchet, a latch by which the free end of the lever-arm is normally raised and the lug held out of engagement with the ratchet, with a device within the reach of the driver whereby the latch may be disengaged and the lever dropped to allow the lug to engage the ratchet whereby the basket is revolved and discharged, said latch upon its release being returned into the path of the lever so as to again raise it and disengage the lug when the basket has reached its upright position.

3. A basket suspended upon a trunnion-shaft and adapted to receive cut grass from the conveying-belt of a mowing-machine, a continuously-rotating pulley and ratchet-wheel carried thereby mounted upon the trunnion-shaft, an arm supported upon the outer end of said shaft with lugs to which one end of a spring-pressed lever is fulcrumed, a lug upon said lever adapted to engage the teeth of the ratchet, a movable latch by which the lug is normally held out of engagement with said teeth, means for disengaging the latch to allow the lug to engage the teeth whereby the trunnion-shaft and basket are revolved, a hub fixed upon the trunnion-shaft having an arm extending across it from side to side, a corresponding arm fixed to the

lever-supporting bar extending parallel with the first-named arm, a spring between said two parallel arms whereby the basket is allowed to oscillate when brought to a state of rest after its revolution is completed, and the strain upon the parts is relieved.

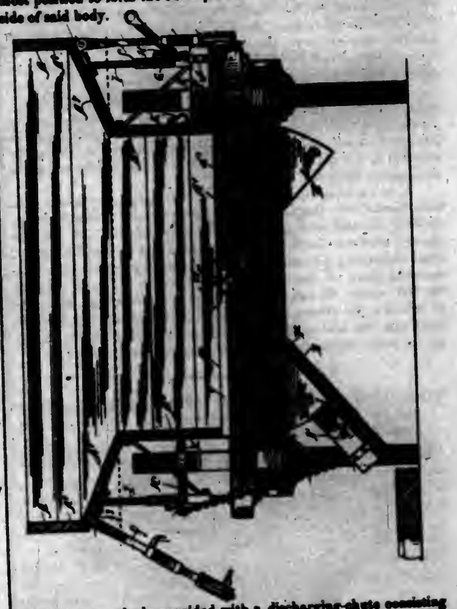
4. A basket mounted upon trunnions adapted to receive cut grass from the carrying-belt of a mowing-machine, mechanism for rotating the basket, an arc-shaped rack fixed to the machine so that the open mouth revolves against the arc and the contents are prevented from escaping until the basket is entirely reversed, said basket having the side opposite to the rack loosely pivoted at the top whereby as the basket revolves said side presses upon the contents by gravitation and assists in forcing said contents out of the basket.

5. The basket suspended upon trunnions adapted to receive grass from the carrying-belts of a mowing-machine, mechanism by which said basket is periodically revolved to discharge its contents and return to a vertical position, a side of said basket being hinged at the top whereby its opposite end is permitted to swing inwardly and is adapted to press upon the contents thereof by gravitation when the basket is reversed whereby the heap is smoothed and pressed into shape, and means for limiting the swinging movement of said side.

6. A basket mounted upon trunnions and adapted to receive the cut grass from the carrying-belts of a mowing-machine, mechanism by which the basket is periodically revolved so as to discharge its contents and return it to its normal upright position, an essentially vertically disposed fixed arc or segment against which the mouth of the basket moves during the first half of its rotation until it is in position to discharge upon the ground, and a side of the basket loosely pivoted at the top whereby the bottom is allowed to press upon the contents of the basket by gravitation as the basket revolves from the upright to the reverse position, and to be returned to its normal position as the basket leaves it and returns to its upright position.

608,817. CAN. ERNST M. HALLBAUER, Chicago, Ill. Filed May 15, 1897. Serial No. 636,630. (No model.)

Claim.—1. A can having the head B formed with a circumferential depression *r* and a nozzle about the opening, said nozzle having an outward-projecting bead *m* presenting to the inner surface of the cover-flange, for engagement therewith, practically a mere circumferential line, substantially as and for the purpose set forth.



2. A can having the head B formed with a circumferential depression *r* and a nozzle about the opening, said nozzle having an outward projecting bead *m* presenting to the inner surface of the cover-flange, for engagement therewith, practically a mere circumferential line, and provided with an inturned reinforcing-flange *l*, substantially as and for the purpose set forth.

3. In a can, the combination with the can-body of a head formed with a circumferential depression *r* and a nozzle about the opening, said nozzle having an outward-projecting circumferential bead *m* presenting about its greater circumference practically a mere line, and a cover C having the shoulder *k* and flange *i* to surround said nozzle and engage with said bead substantially as and for the purpose set forth.

4. In a can, the combination with the can-body of a head formed with a circumferential depression *r* and a nozzle about the opening, said nozzle having an outward-projecting bead *m* about its edge, presenting about its greater circumference practically a mere line and an inturned reinforcing-flange *l* on said nozzle, and a cover C having the shoulder *k* and flange *i* to surround said nozzle and engage with said bead at the inturned end of said shoulder, substantially as and for the purpose set forth.

608,818. WAGON. CHESTER HOYT, Chicago, Ill. Filed May 28, 1897. Serial No. 638,138. (No model.)

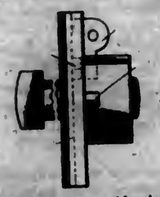
Claim.—1. A wagon provided with a discharge chute consisting of a flap which forms part of the bottom of the body and side plates depending from said body, said flap being extended beyond the side wall of the body and fitting at its side edges at its part inside of said wall against said side plates to form the inner part of the chute and being provided outside of the body with lateral upwardly-extending flanges which supplement said side plates when the flap is in its lowermost position to form the outer part of the chute which extends outside of said body.

2. A wagon-body provided with a discharging-chute consisting of a hinged flap which forms part of the bottom of the body and is located flush with said bottom when in its closed position, depending side plates, and means for locking the flap in its elevated position, comprising a detent hinged to the body above the end of the flap and a movable locking-hook connected with the detent and adapted to engage a stationary holding part of or upon the body.

3. In combination with a wagon-body, a hinged flap which forms part of the bottom of the body, depending side plates at the side edges of the flap, a detent hinged to the body above the free end of the flap and a sleeve sliding on the detent and provided with a rigid hook, said hook being adapted to engage a stationary part of or upon the body.

4. In combination with a wagon-body having overhanging side walls, a hinged flap which forms part of the bottom of the body, depending side plates forming with the flap a discharge-chute, a vertical standard connected with said overhanging portion of the side wall on one side of the body and means for lifting the free end of the flap consisting of a shaft mounted transversely in said standard and provided with a hand-crank and chains attached to the side margins of the flap and engaging said shaft.

5. A wagon-body the bottom of which is provided with a central, transverse opening, a central, longitudinal connecting-bar which joins the parts of the body on either side of said opening and is flush with the bottom of the body, said body having discharge-chutes formed by flaps which are hinged at the center of the body to said connecting-bar and form when their outer ends are elevated part of the bottom of the body and having continuous side pieces by which longitudinal strength or stiffness is given to the body.

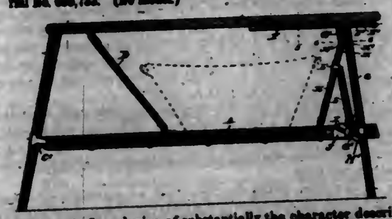


6. A wagon-body embracing continuous longitudinal side pieces, two parallel cross-pieces forming central openings for discharging-chutes, a central, longitudinal bar extending between and connecting said cross-pieces with its top surface flush with the bottom of the body and flaps hinged to said bar between the cross-pieces and constructed to lie flush with and form when closed parts of the bottom of the wagon-body.

7. In combination with a wagon-body, having parallel cross-pieces forming chute-openings and hinged flaps located between said cross-pieces, of a central metal connecting-bar attached at its ends to the cross-pieces and provided with centrally-arranged pivot-pins engaged by the hinge members of both flaps to pivotally support the same, the said bar being so located as to support said flaps flush with the bottom of the body when the latter are in their closed position.

8. In combination with a wagon-body, having parallel cross-pieces forming chute-openings and hinged flaps located between said cross-pieces, of a central metal connecting-bar attached at its ends to the cross-pieces and provided with centrally-arranged pivot-pins engaged by the hinged members of both flaps to pivotally support the same, said bars being made of cast metal and provided with lateral flanges and with transverse webs through which said pivot-pins are inserted.

9. A wagon-body comprising parallel cross-pieces, between which are formed openings for discharging-chutes, hinged flaps located between the said cross-pieces and serving when elevated to close said openings, depending side plates attached to the inner faces of said cross-pieces and forming the side walls of the discharging-chute when the flaps are lowered and braces for the said depending plates secured to the lower parts of said plates and extending upwardly to and outside of the cross-pieces.



608,819. NUT-LOCK. PERRY B. KENYON, Westerly, R. I. Filed June 3, 1897. Serial No. 639,205. (No model.)

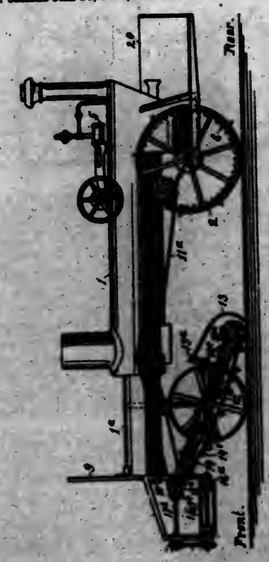
Claim.—1. In a nut-lock, the combination with a slotted plate, said slot intersecting the bolt-aperture therein, ratchet-teeth provided in the side walls of said slot, a nut having in the inner face slots directed toward the center thereof, a key adapted to enter and occupy the recess formed by the slot in said nut registering with the slot in said plate after the backward rotation of the nut on the bolt which engages the ratchet-teeth on the key with the ratchet-teeth on the plate, thereby maintaining the engagement of said key with the plate and nut and preventing rotation of the nut.

2. An improved nut-locking device having combined therein a slotted plate, a nut having its inner surface slotted, a key adapted to enter and occupy the recess formed by the registering of the slot in the plate and one of the slots in the nut, teeth formed in the slot in said plate, and ratchet-teeth upon said key which are engaged with ratchet-teeth on said plate by the backward rotation of the nut on the bolt, the whole constructed and adapted for operation, substantially as herein set forth.

608,820. COMBINATION STEP-LADDER AND IRONING-BOARD. ANDREW SANDERSON, Chicago, Ill. Filed May 3, 1897. Serial No. 636,723. (No model.)

Claim.—1. In a device of substantially the character described, the combination of the step-ladder, the hinged top thereof having the supporting-legs secured thereto, hinged guides secured to the side pieces of the ladder through which the supporting-legs pass, the supporting-legs for the free end of the ironing-board, and a catch carried by one of the ladder-steps and adapted to engage the cross-bar of the supporting-legs of the hinged top when the device is used for a ladder, substantially as shown and described.

2. In a device of substantially the character specified, the combination of the step-ladder having the hinged top, the supports therefor, an ironing-board hinged to said top, the hinged supporting-legs for the free end of the ironing-board, suitable slotted guides secured to the side pieces of the step ladder, and projections carried by said supporting-legs adapted to engage in the slots of said guides, substantially as shown and described.



3. In a device of substantially the character specified, the combination of the step-ladder having the hinged top, the supporting-legs therefor, an ironing-board hinged to said top, the supporting-legs for the free end of said board provided with suitable projections near their lower ends, slotted guides carried by the side pieces of the step-ladder in which said projections fit, a brace-rod hinged at one end to the step-ladder and having its other end engaging the supporting-legs, and a bolt carried by the said legs for engaging said end, substantially as shown and described.

4. In a device of substantially the character specified, the combination of the step-ladder having the hinged top, the supporting-legs therefor, brace-rods hinged at one end to the side pieces of the step-ladder, and at their other ends to the hinged top, an ironing-board hinged to said top and supporting-legs for the free end of the ironing-board, substantially as shown and described.

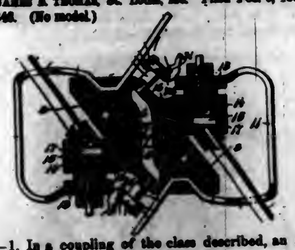
5. In a device of substantially the character described, the combination of the step-ladder having a hinged top, an ironing-board hinged to said top and having at one end a longitudinally-grooved projecting strip, and a bolt, supporting-legs for the free end of said ironing board secured by the bolt when the parts are folded and the device used as a step-ladder and projections at their upper ends which slide in the grooves of said strip, a brace-rod hinged to the cross-piece of said legs, a brace-rod hinged to one of the steps of the step-ladder, said rods having a sliding and hinged connection with each other at their free ends, substantially as shown and described.

6. In a device of substantially the character described, the combination with a step-ladder, having a hinged top, of an ironing-board hinged thereto, suitable supports for the free end of said board for holding it in horizontal position, means for locking the supports to the board when the device is used as a step-ladder, and the sliding-brace-rods pivotally connected to the ladder and to the supports, substantially as described and for the purpose stated.

608,821. TRACTION-ENGINE. WILLIAM STEPHENSON, Morris, Canada. Filed Mar. 17, 1897. Serial No. 628,099. (No model.) Patented in Canada Jan. 28, 1896, No. 51,157.

Claim.—The combination with a wheeled platform, of a straw-burning engine mounted thereon and imparting motion thereto, a transverse shaft projecting from one side of the platform and driven by the engine, a frame pivoted at its forward end to the said shaft, rake-teeth and supporting-wheels upon the depending end of the said frame, an apron mounted on the said frame and passing over the said shaft and driven thereby, a longitudinal apron upon the opposite side of the engine, a sprocket-chain extending across the front of the engine, driven by the transverse shaft and driving the transverse and longitudinal aprons, substantially as described.

608,822. SPLIT NEEDLE. EDWIN STRAIN, Melrose, Mass., assignor of one-half to Helen A. Blanchard, New York, N. Y. Filed Feb. 5, 1898. Serial No. 669,401. (No model.)



Claim.—1. A needle having an enlarged shank, a longitudinal slot extending through the needle from the eye thereof to and into the lower portion of the shank, and partially dividing the needle into

thicker and thinner portions which are integral with and united by the point end of the needle, a lateral opening from said slot through one side of the shank, said thinner portion being apart from the thicker portion at its upper end and forming a spring and having a groove in the face of its upper end, such upper end having the same conformation as the outer surface of the parts of the shank at the same height, a groove formed in one side of the shank, and a pin secured in said groove and provided at its lower end with a pointed guard arranged to lie in the groove in the free end of the spring, substantially as described.

2. A needle having an enlarged shank, a longitudinal slot extending through the needle from the eye thereof to and into the lower portion of the shank, and partially dividing the needle into thicker and thinner portions which are integral with and united by the point end of the needle, a lateral opening from said slot through one side of the shank, said thinner portion being apart from the thicker portion at its upper end and forming a spring having an inclined inner surface at its upper end and having a groove in the outer face of its upper end, such upper end having the same external conformation as the outer surface of the parts of the shank at the same height, a groove formed in one side of the shank, and a pin secured in said groove and formed at its lower end as a pointed guard arranged to cross the lateral opening and lie in the groove in the free end of the spring, substantially as described.

608,823. COMBINED AUTOMATIC CAR AND AIR-BRAKE COUPLING. JAMES B. THOMAS, St. Louis, Mo. Filed Feb. 6, 1897. Serial No. 622,348. (No model.)

Claim.—1. In a coupling of the class described, an automatic air-brake coupling head or shoe carrying a clamp formed with a slot therein, said head or shoe being provided with an interior passage communicating with separated orifices formed in the inner side of the head or shoe, and a train-pipe fitted in one of the orifices and extended through the slot of said clamp, substantially as set forth.

2. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage communicating with separated coupling and train-pipe orifices, and a rigid interchange coupling-nipple fitted directly to the head or shoe and having communication with the interior fluid-passage through an orifice independent of the coupling and train-pipe orifices, said coupling-nipple being adapted to interlock with an unlike air-brake coupling, substantially as set forth.

3. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage communicating with separate coupling and train-pipe orifices, an interchange coupling-nipple fitted to the head or shoe and communicating with the interior fluid-passage, said nipple being provided at its outer end with a coupling-head, a dust-cap fitted to said coupling-head, and fastening means for securing the dust-cap over the orifice in said coupling-head of the nipple, substantially as set forth.

4. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage with communicating orifices, an interchange coupling-nipple fitted to the head or shoe and communicating with the interior fluid-passage, said nipple being provided at its outer end with a coupling-head formed with coupling flanges or lugs, a dust-cap pivoted to the coupling-head of the nipple and provided at one edge with a hook for engagement with one of said flanges or lugs, and a hooked locking-dog pivoted to the coupling-head of the nipple and adapted to engage with either said dust-cap or an unlike air-brake coupling, substantially as set forth.

5. In a coupling of the class described, an automatic air-brake coupling head or shoe having a train-pipe connection and formed with a transverse fluid-passage terminating in oppositely-located orifices, and dust-guards arranged to cover said oppositely-located orifices to dispense with a cut-off cock for the train-pipe connection, substantially as set forth.

6. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage and a coupling-orifice in its inner coupling-face, a pivotal dust-shield arm having a vertically-movable pivotal connection at one end with the coupling head or shoe at the lower edge of the latter, said pivotal dust-shield arm being provided intermediate its ends with a cap projection and at its free end with a locking-hook adapted to engage with the top edge of the coupling head or shoe, substantially as set forth.

608,824. AUTOMATIC COMBINED CAR AND AIR-BRAKE COUPLING. JAMES B. THOMAS, St. Louis, Mo. Filed May 13, 1897. Serial No. 634,991. (No model.)

Claim.—1. In a coupling of the class described, the combination with the car coupling-head, and the air-brake coupling head or shoe arranged therebelow, of a pair of pivotally-supported bracket-arms, and movable link connections between the forward ends of said arms and the inner or rear end of the air-brake coupling head or shoe, substantially as set forth.

2. In a coupling of the class described, the combination with the car coupling head and draw-bar, and the air-brake coupling head or shoe arranged therebelow, of a pendent hanger-post provided at its upper end with a pair of T-shaped locking-heads secured in correspondingly-shaped recesses or sockets formed in the draw-bar, a pair of connected swinging bracket-arms pivoted to said hanger-post, and pivotal link connections between the forward ends of said bracket-arms and the rear end of the air-brake coupling head or shoe, substantially as set forth.

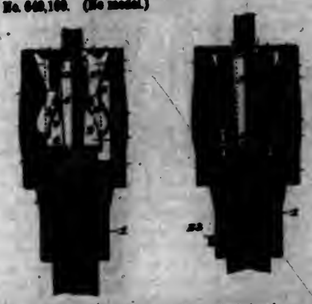
3. In a coupling of the class described, the combination with the car coupling-head, of the air-brake coupling head or shoe arranged below the car coupling-head and provided at its rear end with a pair of perforated ears, a pair of connected pivotally-supported bracket-arms, and pivotal segmental link-blocks provided with bifurcated ends and pivotally connecting the forward ends of said arms with the ears of the air-brake coupling head or shoe, substantially as set forth.

4. In a coupling of the class described, an automatic air-brake coupling head or shoe provided at its forward end with an inner beveled side portion and at its front upper corner with a beveled bill, an offstanding guide or guard tongue normally lying opposite and beyond said front beveled side portion, and a clamp mounted on the head or shoe and adapted to engage with the outer side of a companion head or shoe, substantially as set forth.

5. In a coupling of the class described, an automatic air-brake coupling head or shoe, a laterally-movable rigid clamp-yoke loosely embracing the rear end portion of the head or shoe, and means for tightening said clamp-yoke against the companion head or shoe, substantially as set forth.

6. In a coupling of the class described, an automatic air-brake coupling head or shoe, a laterally-movable rigid clamp-yoke slidably embracing the rear end portion of the head or shoe, and means for tightening said clamp-yoke against a companion head or shoe by the air-pressure of the air-brake system, substantially as set forth.

7. In a coupling of the class described, an automatic air-brake coupling head or shoe, a rectangular laterally-movable clamp-yoke slidably embracing the rear end portion of the head or shoe and provided with a forwardly-extending rigid clamping-arm projected centrally from the inner side portion of the yoke and adapted to engage against the outer side of the companion head or shoe, and a pressure-adjusted connection between the outer side of said yoke and the coupling head or shoe, substantially as set forth.



8. In a coupling of the class described, an automatic air-brake coupling head or shoe, having an interior fluid-passage and an orifice in its coupling-face, and a dust-shield arm pivotally supported at the inner side of the coupling head or shoe and carrying an offstanding guide-tongue for receiving the impact of the companion head or shoe, substantially as set forth.

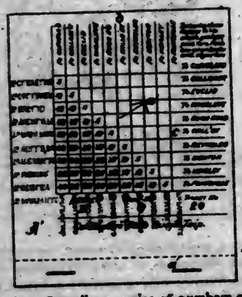
9. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage and an orifice in its coupling-face, and a swinging dust-shield arm adapted to work over said orifice and pivoted at its lower end to the inner side of the coupling head or shoe, said dust-shield arm being provided at its upper end with a laterally-disposed hook adapted to straddle and engage with the top edge of the coupling head or shoe, and carrying at a point intermediate of its ends an offstanding forwardly-disposed guide or guard tongue, substantially as set forth.

10. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage and an orifice in its coupling-face, a swinging shield-arm adapted to work over said orifice and carrying at a point intermediate its ends an obtuse-angled offstanding guide or guard tongue, said shield-arm being provided at its upper end with a hook having a beveled upper side and engaging with the top edge of the head or shoe, and an adjusting-hook having a swiveled support at one end on the head or shoe and provided at its free end with a beveled beak or nose adapted to be engaged with the beveled upper side of the shield-arm hook of the companion head or shoe, substantially as set forth.

11. In a coupling of the class described, an automatic air-brake coupling head or shoe having an interior fluid-passage and an orifice in its coupling-face, and a movable dust-shield arm supported at the inner side of the head or shoe and carrying a tongue for receiving the impact of the companion head or shoe, substantially as set forth.

608,825. BIT-STOCK. MELVIN RAMSEY, Oklahoma, Okla., assignor of one-fourth to I. B. Johnson, same place. Filed Aug. 28, 1897. Serial No. 649,169. (No model.)

Claim.—1. The combination with a shaft having a slotted head, of fulcrum-pins extending across the slot in the head near its edges, clamping-jaws fulcrumed on the pins with their outer faces projecting beyond the periphery of the head, a sleeve slidably fitted over the head to open and close the jaws by its movement, and springs interposed between said sleeve and an adjustable support on the shaft to normally force the sleeve outwardly to close the jaws, substantially as described.



2. The combination with a shaft having a slotted head, the jaws supported to rock on fulcrums in said slot, the outer faces of said jaws being curved outwardly above and below their fulcrums, a sleeve slidably fitted over the head and having an internal shoulder to engage the curved outer faces of the inner ends of the jaws, and a flaring bore at its outer end to engage the curved outer faces of the outer ends of the jaws, and springs interposed between said internal shoulder and an adjustable support on the shaft, to normally force the sleeve outwardly, substantially as described.

3. The combination with a shaft having a slotted head, of jaws supported to rock on fulcrums in said slot, the outer faces of said jaws being curved outwardly above and below their fulcrums, a sleeve slidably fitted over the head and having an internal shoulder to engage the curved outer faces of the inner ends of the jaws, and a flaring bore at its outer end to engage the curved outer faces of the outer ends of the jaws, a collar slidably supported on the shaft to extend within said sleeve, springs interposed between the said shoulder and the end of the collar, and means to lock the collar on the shaft, substantially as described.

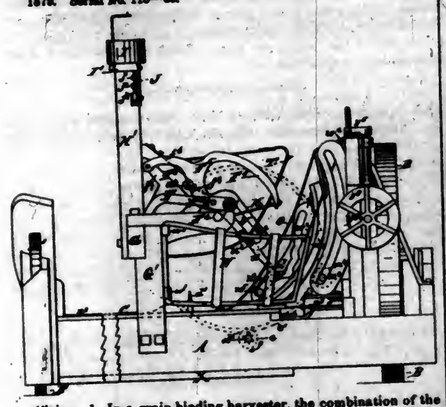
4. The combination with a shaft having a slotted head, the opposing faces of said slot being provided with V-shaped grooves extending longitudinally thereof, of jaws supported to rock on fulcrums in said slot, the outer faces of said jaws being curved outwardly above and below their fulcrums, and their inner faces having overhanging lips at their outer ends, and V-shaped grooves extending longitudinally from said lips, and said lips having curved recesses in their opposing faces, a sleeve slidably fitted over the head and having an internal shoulder to engage the curved outer faces of the inner ends of the jaws, and a flaring bore at its outer end to engage the curved outer faces of the outer ends of the jaws, and springs interposed between said internal shoulder and an adjustable support on the shaft to normally force the sleeve outwardly, substantially as described.

5. The combination with a shaft having a slotted head, of fulcrum-pins extending across the slot in the head near its edges, clamping-jaws fulcrumed on the pins with their outer faces projecting beyond the periphery of the head, a sleeve slidably fitted over the head to open and close the jaws by its movement, said sleeve having an internal annular shoulder, and the head and sleeve having registering semicircular grooves extending outwardly from said shoulder, coiled springs seated in said grooves and abutting at one end against said shoulder, a collar slidably supported on the shaft to engage the other ends of the springs, and means to lock the collar on the shaft, substantially as described.

608,826. FARE-RECEIPT SLIP. FRED S. BOSTON and CHARLES F. BATES, Cleveland, Ohio. Filed Feb. 9, 1897. Serial No. 622,654. (No model.)

Claim.—1. In a fare slip, a series of numbers on one side indicating the amount of fare between two stations, said numbers arranged in lines forming numerical progressions, a series of names of stations, suitable means for identifying each number with two stations between which said number indicates the amount of fare, each number having opposite on the other side of said slip, the number next below it in the progression of which it is a member, substantially as set forth.

2. In a fare-receipt slip, a series of numbers on one side indicating the amount of fare between two stations, said numbers arranged in lines in two directions and forming numerical progressions in both said directions, a series of names of stations, each name appearing twice in said series, and suitable means for identifying each number with two stations between which said number indicates the amount of fare, each number having opposite it on the other side of said slip, the number next below it in the progression of which it is a member, substantially as set forth.



3. In a fare-receipt slip a series of numbers on one side indicating the amount of fare between two stations, said numbers arranged in lines in two directions and forming numerical progressions in both said directions, each number having opposite it on the other side the number next below it in the progression and having opposite it in the direction of each line the name of one of the two stations between which it indicates the fare, substantially as set forth.

4. A fare-receipt slip having an obverse and a reverse side, and provided on the obverse side with a column of names of the stations arranged in sequence along one side of a parallelogram, and a similar column arranged along an adjacent side of said parallelogram, and having the amount of fare between any two stations indicated at the junction of a line drawn from the name of one of said two stations in one column parallel with the adjacent side of the parallelogram and another line drawn from the name of the other station in the second-named column and parallel with the side of the parallelogram adjacent to its side, the reverse side being similarly arranged with respect to the same parallelogram, but having one column shifted a distance substantially equal to the distance between two successive names on the obverse side, substantially as set forth.

5. A fare-receipt having an obverse and a reverse side, and provided on the obverse side with a column of names of stations arranged in sequence along one side of the parallelogram and a similar column arranged along an adjacent side of said parallelogram and having the amount of fare between any two stations indicated at the junction of a line drawn from one of said stations as one column, parallel with the adjacent side of the parallelogram and another line drawn from the name of the other station in the second-named column and parallel with the side of the parallelogram adjacent to its side, the reverse side having similar columns arranged along the other two adjacent sides of the same parallelogram and having the

fare amounts arranged in the same manner as on the obverse side, one of said columns on said reverse side being shifted a distance substantially equal to the distance between two successive names, substantially as set forth.

603,827. BINDING REAPING-MACHINE. WILLIAM W. BURSON, Rockford, Ill., assignor, by direct and mesne assignments, to the McCormick Harvesting Machine Company, Chicago, Ill. Filed May 22, 1879. Serial No. 115—83.

Claim.—1. In a grain-binding harvester, the combination of the platform, a raking mechanism, an upwardly-inclined deck on which the grain received from the raking-platform is bound, and a binding mechanism adapted to travel with and bind the grain while moving on said deck.

2. In a grain-binding harvester, the combination of the platform, a raking mechanism, an upwardly-inclined deck on which the grain received from the raking-platform is bound, mechanism to elevate the grain on the deck, and binding mechanism adapted to travel with and bind the grain while being elevated.

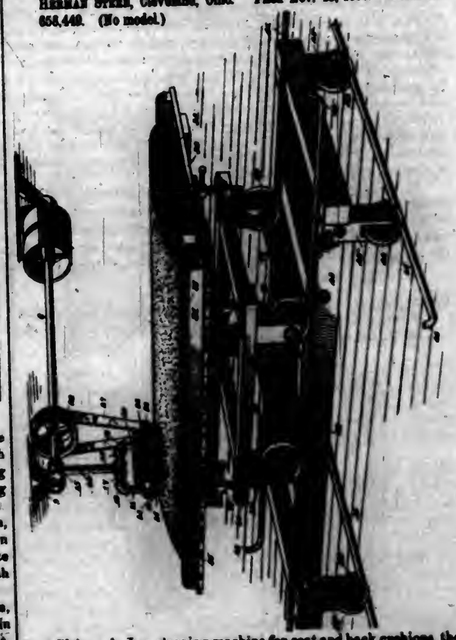
3. In a grain-binding harvester, the combination of the platform, a raking mechanism, an upwardly-inclined deck on which the grain received from the raking-platform is bound, mechanism for separating and compressing the grain into bundles and elevating it on the deck, and binding mechanism adapted to travel with and bind the grain while being elevated.

4. In a binding mechanism, the combination with a cord tier or knotter, of a receptacle for holding the balls of cord, said receptacle having expansible and adjustable walls.

5. A cord-holder consisting of a receptacle to contain the ball, with means whereby its capacity can be varied by adjusting the sides to and from the center for different-sized balls.

6. In a cord-holder for grain-binders, a bottom, sides to retain the balls on the bottom, and a device whereby the sides of the holder may be adjusted to and from the center for large and small balls.

7. In combination, to form a cord-holder, a bottom or support for the balls, an envelop to retain the balls thereon, said envelop being composed of a sheet of metal attached to the bottom of the holder at its lower edge, and having its upright edges overlapping, and means whereby the meeting edges of the metal sheet may be adjusted and secured with respect to each other so as to enlarge or decrease the diameter of the holder.

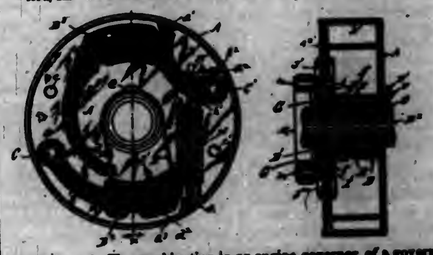


8. In a cord tying or knotting mechanism, the combination of a rotary hook having a pivoted latch, with a latch-opener, the latter adapted to engage the latch forward of its pivot as the hook rotates, so as to open said latch.

9. In a harvester, the combination of the main supporting-wheel supported and adjusted in guides on the main frame, the grain-wheel, a shaft mounted in bearings on the machine-frame, said shaft having different diameters, and connections between the said shaft and the main and grain wheels, that leading to the main wheel being connected with the larger diameter of the shaft.

10. In a harvester, the combination of the main supporting-wheel, the grain-wheel, a winding-shaft mounted in bearings on the machine-frame, said shaft having winding portions or drums of different diameters, and flexible connections between said shaft and the main and grain wheels, that leading to the main wheel being connected with the larger diameter of the shaft.

11. In a harvester, the combination of the main supporting-wheel, gear-racks on the machine-frame with which pinions on the wheel-axle engage, the grain-wheel journaled on an arm pivoted to the machine-frame, a winding-shaft having winding portions or drums of different diameters, a flexible connection extending from the larger diameter of said shaft to the main-wheel axle, and a similar connection leading from the smaller diameter of the shaft to the arm of the grain-wheel.



603,828. CUSHION-CLEANING MACHINE. GEORGE H. DOW and HERMAN STEER, Cleveland, Ohio. Filed Nov. 13, 1897. Serial No. 658,449. (No model.)

Claim.—1. In a cleaning-machine for seat and back cushions, the combination with a bottom frame mounted on transverse rails and carrying longitudinal rails on its top, of an upper frame mounted upon longitudinal rails, a table adjustably mounted upon said upper frame, and adjusting side and end clamps upon said table, substantially as described.

2. The combination with a line-shaft, of a T-fitting mounted looseiy thereon, a pipe or rod secured in said fitting at right angles to the shaft, a T-fitting at the outer end of said pipe or rod, branch lateral pipe-sections or rods secured in the outer T-fitting, elbows secured at the outer ends of the lateral branches, pipe-sections extending forward from the elbows, T-fittings upon the outer ends of said sections, a shaft journaled in said T-fittings, and a rotary brush upon said shaft, substantially as described.

603,829. ENGINE-GOVERNOR. CHARLES M. GEISSLER, Rockford, Ill. Filed Jan. 18, 1897. Serial No. 619,861. (No model.)

Claim.—1. The combination in an engine-governor, of a governing-eccentric, concentric with the shaft upon which the governor is mounted, weight-and-spring mechanism communicating with and rotating said governing-eccentric, a fixed disk or plate adjacent to and in substantially the same plane with the governing-eccentric, and a valve-rod eccentric mounted on guides supported by said disk or plate and actuated by said governing-eccentric, substantially as and for the purpose set forth.

2. The combination in an engine-governor, of a disk or plate adapted to be secured to an engine-shaft and adapted to form one side of an inclosed case, weights mounted on studs on said disk adapted to be moved outward by centrifugal force and inward by a spring or springs, means connecting said weights so that they will move in and out in unison, a governing-eccentric adapted to be rotated around the shaft by the movement of said weights, a plate or cover adapted to be secured to said first-named plate or disk in substantially the same plane as the governing-eccentric and forming the other side of an inclosed case, guides in said plate or cover, a valve-rod eccentric supported by and operating on said guides, and means connecting said governing-eccentric with said valve-rod eccentric, and moving it back and forth across the shaft according to the movement of said governing-eccentric, substantially as and for the purpose set forth.

3. The combination in an engine-governor, of a disk or plate adapted to be secured to an engine-shaft, so as to form one side of an inclosed case, an annular rim thereon forming the periphery of such inclosed case, a plate or disk A^1 adapted to be secured to said first-named plate or disk and the rim thereof so as to form the other side of such inclosed case, a governing-eccentric in substantially the plane of the plate or disk A^1, centrifugal weights, springs within said inclosed case for actuating said governing-eccentric, guides on said disk or plate A^1, a plate or frame operating on said guides, a valve-rod eccentric mounted on said plate or frame, and a separable eccentric-strap on said governing-eccentric having flat faces on opposite sides of its periphery which contact with the valve-rod-eccentric plate or frame, substantially as and for the purpose set forth.

4. The combination in an engine-governor, of a governing-eccentric, governing mechanism actuating said eccentric, a reciprocating plate or frame traveling on guides substantially in the same plane with the governing-eccentric and actuated by said eccentric-governing mechanism, and a valve-rod eccentric adapted to be adjusted on said reciprocating plate or frame, and secured thereto so as to adapt the governor to the varying travel and lap of the valves of different makes of engines, substantially as and for the purpose set forth.

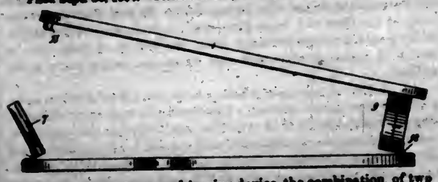
5. In an engine-governor, a governing-eccentric, a disk or plate having a rectangular opening therein, on substantially the same plane with the governing-eccentric, guide-rods babbitted in the sides of said opening, a sliding plate or frame reciprocating on said guide-rods, and means for adjusting said plate or frame to said guide-rods so as to take up wear, substantially as and for the purpose set forth.

6. In an engine-governor, a disk or plate A^1 having a rectangular opening therein, a sliding plate or frame reciprocating in said opening and supporting a valve-rod eccentric, a governing-eccentric connected with and operating the plate carrying the valve-rod eccentric, and mounted in substantially the same plane with the disk or plate A^1, centrifugally-operating governing-weights, a flexible connection between said weights and said governing-eccentric, substantially as and for the purpose set forth.

7. The combination in an engine-governor, of centrifugally-operating weights, an adjustable arm d on one of said weights, and a flexible connection E between said arm and the outer end of the other weight, substantially as and for the purpose set forth.

8. The combination in an engine-governor, of a centrifugally-actuated weight, a spring for moving said weight inward, a sector-block adapted to be moved inward and outward on the weight-arm consisting of two sections, one of which is adjustable upon the other, and a flexible connection between said spring and the adjustable section of said sector-block, substantially as and for the purpose set forth.

9. The combination in an engine-governor, of a centrifugally-actuated weight, a spring for moving said weight inward, a sector-block, one section of which is adapted to be moved back and forth on the weight-arm for adjusting the speed of the governing mechanism, a flexible connection between said spring and said sector-block, an adjustable quadrant-clip operating against the flexible connection between the spring and sector-block, and a means for adjusting said quadrant-clip, substantially as and for the purpose set forth.



603,830. HAT-PIN SECURER. WILLIAM P. KNERSONE, Honeybrook, Pa. Filed Jan. 4, 1898. Serial No. 665,894. (No model.)

Claim.—1. A clamp or securer for hat-pins, comprising two jaws substantially semicylindrical in form, each end being slightly tapered and one end smaller than the other, the two diameters being joined by a shoulder, a ring adapted to be slipped upon the smaller diameter, a threaded rod inserted between the jaws, bearing upon the ring and projecting beyond the rear ends of the jaws, and a tapered nut engaging the projecting end of the threaded rod for forcing the rear ends of the jaws apart, substantially as described.

2. The combination of the jaws, B and C, each provided with recesses, D and E, which, when the jaws are placed together, form a central bore with an increasing diameter from the middle to the ends, each jaw being formed with a shoulder, H, on its outside, the ring, L, adapted to embrace the smaller ends of the jaws and resting against the shoulder, H, the threaded rod, I, forked at J and provided with outwardly-projecting toes, K, and the tapering nut, M, adapted to be inserted in the larger end of the central recess and to engage the threaded end of the rod, I, substantially as described.

603,831. IRONING-BOARD. ALMA A. POST, Waukesha, Wis. Filed Sept. 20, 1897. Serial No. 652,263. (No model.)

Claim.—In an improved ironing device, the combination, of two longitudinally-arranged boards, a leg hinged to one of said boards and adapted at its free end to support one end of the other board, and said other board provided at its corresponding end with a projecting lug adapted to fit in front of the free end of the hinged leg, and another leg fixed at one end to and extending from, one of the boards, and hinged at its opposite end to the other board.

603,832. BLOCK OR SMOOTHING PLANE. PATRICK BREA, Boston, Mass. Filed Sept. 20, 1897. Serial No. 652,271. (No model.)

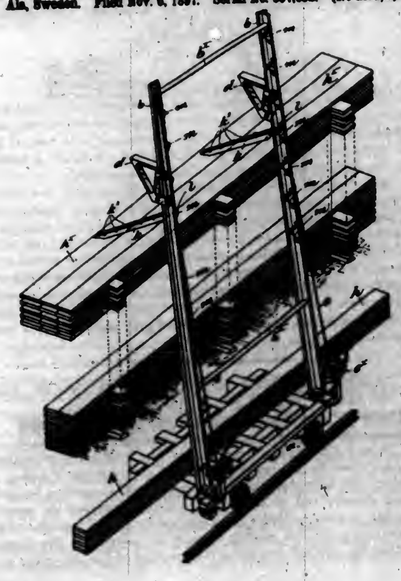
Claim.—1. A block or smoothing plane comprising in its construction a planer-iron or bit and bit-support; a bow-spring constructed to bear at its ends upon the forward and rear ends of the bit; and a headed stud, the bow-spring having a centrally-arranged keyhole-slot to engage the head of the stud as set forth.

2. In a device of the class described the combination with a walled base-piece having a projection on its upper face, of a headed stud mounted in the projection, a slotted bit slidably arranged on the stud, shoulders arranged diagonally of the side walls of the base and forming supports for the bit, a thumb-screw having bearings in said projection of the base and the rear wall, a screw-threaded traveler upon the thumb-screw, having connection with the bit and a bow-spring engaging the head of the stud and bearing at its ends upon the ends of the bit to secure the latter in position and provided with a toot upon its upper face.

603,833. FOUNTAIN-PEN. GERRY A. SPIRE, Irwin, Pa. Filed Apr. 20, 1897. Serial No. 633,102. (No model.)

Claim.—A fountain-pen consisting of the holder proper forming the main reservoir and closed at the outer end by means of a plug c, an exteriorly-screw-threaded tip d provided with an opening, formed on the opposite end of the holder, a sleeve engaging the screw-threaded tip and provided with an interior flange and provided with an aperture, a feed-rod passing through the opening in the screw-threaded tip, said rod secured in the aperture of the sleeve and en-

engaging the pen, said rod having a valve adapted to close the opening in the screw-threaded tip, and a cap for protecting said pen, substantially as shown and described.

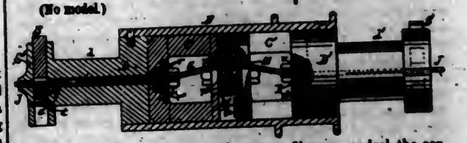


603,884. FILTER. ARCHIBELL M. SPRAGUE, Westfield, Mass. Filed Nov. 6, 1897. Serial No. 657,641. (No model.)

Claim.—1. A filter consisting of a hollow body, a filtering-disk in said body and abutting against a shoulder therein dividing said body into two chambers, screw-threads in one of said chambers, a threaded ring engaging said screw-threads for removably locking said disk in said filter-body, a valve-body located on said body, a valve therein, means for rotating said valve, a chamber in said valve-body at each end of said valve, inlet and outlet ports in said valve-body, a series of ports in said valve for establishing communication alternately between said inlet and outlet ports and either of said chambers in the valve-body, passages from the said chambers in the body of the filter to a waste-pipe, and a multiple-way valve for controlling said passages, whereby either one or both of them may be placed in communication with said waste-pipe, substantially as described.

2. A filter consisting of a hollow body one side of which is open, a disk for closing said opening, a filtering-disk in said body, and abutting against a shoulder therein dividing said body into two chambers, means for removably securing said disk therein, a valve-body located on said filter, a valve therein, a stem for operating said valve, a chamber in said valve-body at each end of said valve, inlet and outlet ports in the valve-body, a series of ports in the valve, whereby, by the operation of the latter water from said inlet may be directed through said disk in either direction to a common outlet or across either face of said disk, a waste-pipe communicating with said two chambers in the filter-body, and a valve for controlling said waste-pipe, substantially as described.

603,885. LIFT FOR PILING LUMBER. ANDERS STENDAHL, Ala, Sweden. Filed Nov. 6, 1897. Serial No. 657,653. (No model.)



Claim.—1. A lift for lumber comprising a wheeled base with upright posts *b* thereon, means mounted on said posts for raising and lowering the lumber and a platform on the wheeled base in front of said posts and hoisting means, on which lumber may be piled for transportation from point to point, substantially as set forth.

2. A lift for lumber, comprising a wheeled base, posts *b*, erected on the said base near one side thereof and inclined over the platform of the base, and means mounted on said posts for raising and lowering the lumber, substantially as set forth.

3. A lift for lumber comprising a wheeled base, uprights or posts *b* thereon, lifting means mounted on said posts, and brackets arranged at different levels on said posts on which to hook detachable skids, of the said skids provided with hooks to engage the brackets on the posts, substantially as set forth.

603,886. ROTARY STRAIGHTENER AND POLISHER. WILLIAM G. ALGEO, Jr., Beaver Falls, Pa. Filed May 6, 1897. Serial No. 634,902. (No model.)

Claim.—1. In combination, the rotary flier or mandrel, the centrifugally-controlled movable guide or die mounted therein, the axial or central dies mounted therein, the polishers and centrifugally-controlled movable holders therefor, and means for rotating the said flier or mandrel and for feeding the material to be straightened through it, substantially as set forth.

2. The rotary flier or mandrel, provided with the two centrally-located dies and the intermediate adjustable die which is adjusted transversely to the axial line by the motion of the said flier or mandrel, substantially as set forth.

3. In a rotary straightener, a wire-guide carried by a support which is loosely mounted in the said straightener and free to move therein under an adjusting force, substantially as set forth.

4. The rotary straightener provided with the movable die, free to move from the central position, under the action of centrifugal force a limited distance, and one or more stops for checking its motion in the opposite direction at the central position, substantially as set forth.

5. In the rotary portion of a straightener, the centrifugally-controlled slide M', movable from the central position, and the die M carried thereby, substantially as set forth.

6. In a rotary straightener, and in combination with the two axial or central wire-guides, the intermediate wire-guide M loosely mounted and free to move under influence of adjusting forces to and from its central or axial position, and stops limiting its motion between the central position in one direction and the maximum eccentricity in the other direction.

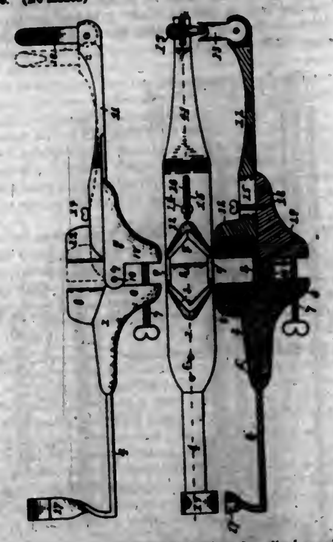
7. In a rotary wire-straightener, the perforated wire-guide provided with two ball-races, the supporting-plates suitably mounted in the said straightener and each provided with a cooperating ball-race, and the balls in the said ball-races, substantially as set forth.

8. In combination in a rotary straightener and with guides for giving a lateral bend to the wire or tube therein, the said guides being normally in alinement when the flier or mandrel is at rest, means for automatically displacing one of the guides from the central position when the said mandrel or flier is rotating, substantially as set forth.

9. The rotary centrifugal polisher, consisting of a polishing device V mounted and movable with the rotating centrifugal holder S, substantially as set forth.

10. The rotary centrifugal polisher, consisting of a polishing device V mounted and movable with the rotating centrifugal holder S, and a stop *t* for limiting the movement of the said holder in one direction to the central position of the holder, substantially as set forth.

603,887. DRY-HOUSE FOR LUMBER, &c. CARL J. BERGSTRÖM, Finnbyttan, Sweden. Filed Aug. 18, 1897. Serial No. 648,281. (No model.)



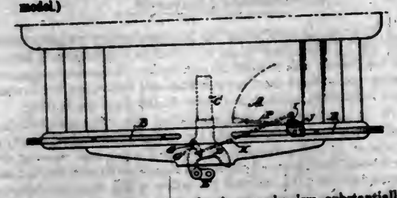
Claim.—1. A dry-house for lumber and the like, having a hot-air passage or room B and drying-rooms arranged at the sides of said passage with means of communication between said rooms and between each of them and said passage, and having also a condensing-room A for the moisture in the air coming from the drying-rooms, said condensing-room being situated alongside of the several drying-rooms and having controllable communication therewith, whereby the condensing-room may be put in direct communication with the several drying-rooms, substantially as set forth.

2. A dry-house for lumber and the like comprising two series of drying-rooms situated at opposite sides of and abutting on a central space which is divided by a floor forming a hot-air passage B, above, and a condensing-room A, below, apertures *d*, connecting the passage B with each of the drying-rooms, apertures *c* connecting the room A with each of the drying-rooms, means for closing said apertures at will, a heater C, in the passage between the drying-rooms, means for causing a circulation of the air in the dry-house and means for condensing the moisture in the air, substantially as set forth.

3. A dry-house having a plurality of drying-rooms arranged side by side and separated by partitions each having an opening *f* near its bottom for the passage of air and a partition-screen *g* near said partition, which screen extends from the floor up part way to the ceiling of the room, whereby a flue or conduit is formed for the air coming in from the bottom of one room, said air being thus compelled to rise through said flue and flow over into the upper part of the adjacent room, substantially as set forth.

603,888. VEHICLE-WRENCH. GRANVILLE DAVIS, North Salem, Ind., and JAMES M. DAVIS, Henry, Ill., assignors of one-third to David D. Thomson, North Salem, Ind. Filed Oct. 11, 1897. Serial No. 654,769. (No model.)

Claim.—1. A vehicle-wrench of the class described, consisting of the jaw-base 1, having the lug 2, the extended portion 6, carrying the thumb-screw 7, and the jaw 3, and having a spring-arm 4, fixedly secured thereto, said spring-arm terminating in a right-angled hook 17, a jaw-support 8, having lugs 9, and a projection 18, an adjustable arm 11, slidingly secured to said support 8, by means of a thumb-nut 14, passing through a slot 15, said arm having the jaw 12, at one end and the pivotally-secured hook 13 at the other end, all substantially as set forth.



2. A vehicle-wrench composed of two oppositely-disposed members, pivotally hinged together, each of said members provided with a nut-engaging jaw upon one side, one of said members provided with a spring-arm terminating in a right-angled hook adapted to engage a vehicle-spoke, and the other member composed of two portions, the jaw portion being slidably adjustable upon the hinged portion and adapted to be regulated by means of a thumb-screw working in a slot in said member, said member terminating in a pivotally-mounted hook-engaging spoke, all as shown and described.

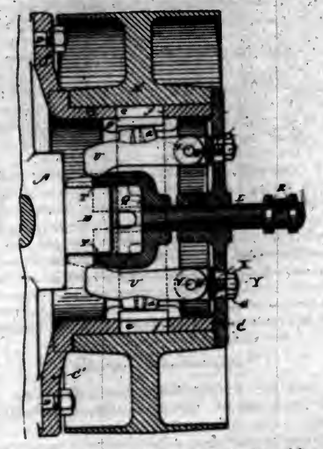
3. In a vehicle-wrench of the class described, the combination with the member 1, having the jaw 3, and the extended portion 6, carrying the thumb-screw 7, and the spring-arm 4, pivotally secured to the member 1, and terminating in a flat hook 17, integral with and at right angles to said arm 4, of the jaw-support 8, pivotally connected with the base 1, and having an extended face 18, adapted to engage the thumb-screw 7, the sliding arm 11, adjustably secured upon the jaw-support 8, by means of the thumb-screw 14, said arm having the jaw 12, upon its inner end and the pivotally-secured hook 13, upon its outer end, all substantially as shown and described.

4. The combination in a vehicle-wrench of the class described, of an adjustable sliding arm 11, having a spoke-engaging hook 13, pivotally secured at its outer end and a nut-engaging jaw integral with its inner end, and the jaw-support 8, having hinged lugs 9, and threaded openings 16, with the jaw-base 1, having the nut-engaging jaw 3, and an extended portion 6, carrying a thumb-screw 7, and having a spring-arm 4, terminating in a hook 17, fixedly secured thereto, as shown and described.

5. In combination in a vehicle-wrench of the class described, the jaw-base 1, having the lug 2, the extended portion 6, carrying the thumb-screw 7, and the jaw 3, the spring-arm 4, fixedly secured thereto, said spring-arm terminating in a hook 17, disposed at right angles to said arm, a jaw-support 8, having a screw-engaging depending portion 18, and provided with openings 16, to receive the said thumb-screw 14, the adjustable arm 11, having the slot 15, and the jaw 12, the pivotally-mounted hook secured to the end of the arm 11, the thumb screw 14, securing said arm upon the support 8, the jaw-base 1, being pivotally connected by means of the bolt 10, passing through the lugs 2, and 9, all as set forth.

603,889. COUPLING-RELEASING MECHANISM. ULYSSES G. DETWILER, Altoona, Pa. Filed Jan. 26, 1898. Serial No. 667,989. (No model.)

Claim.—1. In a coupler-releasing mechanism, substantially as specified, the combination with a vertical rock-shaft, as J, and a rail, as B, of a car-platform, of a bracket or brackets secured to the rail and forming a top bearing for the shaft, a yoke-piece as N extending out from the shaft below the top bracket, a lever as P, pivotally secured to said yoke-piece so as to be movable from a position substantially parallel to the shaft to one substantially perpendicular thereto, and an extension of the top bracket arranged to cover the end of said lever.



2. In a coupler-releasing mechanism, substantially as specified, the combination with a vertical rock-shaft, as J, and a rail, as B, of a car-platform, of a bracket or brackets secured to the rail and forming a top bearing for the shaft, a yoke-piece as N extending out from the shaft below the top bracket, a lever as P, pivotally secured to said yoke-piece so as to be movable from a position substantially parallel to the shaft to one substantially perpendicular thereto, and an extension of the top bracket having a cavity L^3 formed in it and arranged as described to permit the lever to swing on its pivot in one position of the shaft only.

3. In a coupler releasing mechanism, substantially as specified, the combination with a vertical rock-shaft as J and a rail, as B, of a car-platform, of a bracket K secured on the under side of the rail and forming a bearing for the upper end of the shaft, a yoke-piece N secured to the shaft above said bearing, a lever P pivotally secured to the shaft to one perpendicular thereto, and a bracket L secured to the top of the rail so as to extend over the top of the shaft and over the yoke-piece extending out therefrom, said bracket L having a cavity L^3 formed in it to receive the upper end of the lever and permit it to turn down in and only in one position of the shaft.

4. In a coupler-releasing mechanism, substantially as specified, the combination with a vertical rock-shaft, as J, and a rail, as B, of a car-platform, of a bracket K, secured on the under side of the rail and forming a bearing for the upper end of the shaft, said bracket having a stop-lug K^3 arranged to stop the motion of the yoke-piece as described; a yoke-piece N secured to the shaft above said bearing, a lever P pivotally secured to said yoke-piece so as to turn from a position substantially parallel to the shaft to one perpendicular thereto, and a bracket L secured to the top of the rail so as to extend over the top of the shaft and over the yoke-piece extending out therefrom, said bracket L having a cavity L^3 formed in it to receive

the upper end of the lever and permit it to turn down in and only in one position of the shaft.

603,840. POWER-PULLEY. CHARLES F. REUTER, Springfield, Ohio. Filed Sept. 11, 1897. Serial No. 651,288. (No model.)

Claim.—1. In a power-pulley, the combination with a rotatable body and a hollow bearing secured thereto and extended beyond said body to one side thereof, of a pulley loosely mounted upon such bearing, and a clutch mechanism within said hollow bearing to alternately clutch and unclutch the pulley to and from the bearing.

2. In a power-pulley, the combination with a rotatable body and a hollow bearing secured thereto and extended beyond said body to one side of it, of a pulley loosely mounted upon such bearing and clutch mechanism mounted within and supported by said bearing and adapted to clutch and unclutch the pulley to and from said bearing.

3. In a power-pulley, the combination with a rotatable body and a hollow bearing secured thereto and extended beyond said body to one side of it, of a pulley loosely mounted upon such bearing, a cap secured to the bearing, pivoted dogs supported by the bearing, a clutch-shaft mounted in the cap and having a clutch-head adapted to engage with such dogs, and a friction-ring between the bearing and pulley and adapted to be operated by said dogs.

4. In a power-pulley, the combination with a rotatable body and a hollow bearing secured to it and extending to one side of it, said bearing having an annular groove and an interior slotted web, of a pulley loosely mounted on said bearing, a divided friction-ring in said groove and next to said pulley, a cap secured to said bearing, a clutch-shaft mounted in said cap and having a clutch-head, and pivoted dogs supported by said bearing and having contact-blocks adapted to enter the slots in the web and engage with the ends of the divided ring for the purpose described.

5. In a power-pulley, the combination with a rotatable body and a hollow bearing secured to it and extending to one side and having an annular groove and slotted web, a cap secured to said bearing, pivoted dogs adjustably secured to said cap and having contact-blocks adapted to pass through the slots in the web, a divided ring in said annular groove adapted to be engaged by said contact-blocks and a clutch-shaft having a clutch-head and mounted in said cap.

6. In a power-pulley, the combination with a hollow bearing, and a pulley loosely mounted upon it, and a cap secured to said bearing, of clutch mechanism carried by the bearing and cap and adapted to clutch and unclutch the pulley to and from the bearing.
